a sentence after they have read or heard the complete sentence. If the task is auditory (e.g., auditory sentence–picture matching), these tasks place demands on working memory because participants have to process the sentence online as they hear it, keep it in working memory, and then choose a picture that matches the sentence. Offline reading tasks, such as grammaticality judgment or completion tasks, have a different type of limitation. In these tasks, participants usually can take time to think about the meaning of the sentence before they make a decision about the grammaticality or before they decide how to complete it. This allows them to use their explicit knowledge about language and their metalinguistic abilities to make a conscious and controlled decision. The results can overestimate or underestimate their language abilities depending on whether or not they have good metalinguistic abilities.

Online tasks measure the participants' unconscious and automatic response to language stimuli. Therefore, they are largely immune to metalinguistic abilities, at least when the specific task used does not require acceptability judgment of sentences. Participants cannot use their explicit knowledge about language because they do not have the time to think about the meaning or grammaticality of the sentences they read or listen to. In addition, online comprehension tasks measure how they process sentences as they unfold and do not measure the outcome of the processing at the end of the sentence. Therefore, they pose fewer demands on working memory.

Online methods, however, also have some disadvantages. They require a substantially larger amount of time to prepare than offline experiments. This is because the experimental items have to be controlled for many factors, such as frequency, age of acquisition, length, and imageability, and they require more experimental and filler items. Online experiments also tend to last longer than offline ones; data analyses are more complex; and running the tasks is more costly because they require a desktop or laptop, a button box, and special software to present the material and record the participants' responses.

The rest of this section will discuss specific advantages and disadvantages for each of the online tasks presented above.

Word-Monitoring Task

The main advantage of the word-monitoring task is that it measures the participants' unconscious reaction to violations by directing their attention to a word that follows the violation and not to the word that causes the violation, thus tapping their implicit knowledge. A disadvantage is that it implicates working memory, since participants have to keep a word in working memory and press a button when they hear the word again. A second disadvantage is that the word that is being monitored has to appear immediately after the violation. This can be difficult to do depending on the word order of the language and the violation. A third disadvantage is that it measures RTs only at one point in a sentence. Finally, it can test only the processing of violations, and therefore it is limited to phenomena that involve violations.

Cross-Modal Priming

The cross-modal priming task has an advantage compared to the word-monitoring and the self-paced reading/listening tasks in that it involves two modalities, visual and auditory, and therefore the findings are minimally affected by form overlap. An advantage over the self-paced reading/listening and the self-paced listening with picture verification tasks is that sentences are presented unsegmented and therefore at normal speed, which is closer to natural listening. The main disadvantage of the cross-modal priming task is that it is a dual task. Thus it is not as easy to learn and perform as the word-monitoring and the self-paced reading/listening tasks, and requires higher levels of processing capacity and

working memory. Another disadvantage is that, like the word-monitoring task, the cross-modal priming task measures RTs only at one point in the sentence.

Self-Paced Reading/Listening

The self-paced reading/listening tasks have an advantage over the word-monitoring and the cross-modal priming tasks in that they measure RTs for each word or phrase, and therefore provide more data points. This can reveal processing difficulties at any point within the sentence and can provide a better understanding of how participants process sentences word by word or phrase by phrase. A disadvantage of self-paced reading/listening is that the speed of presentation and the presentation itself are somewhat unnatural. In self-paced listening, the presentation is slower than in normal speech; this may create unnatural speech because it breaks the intonation pattern of the sentences. In self-paced reading, the word-by-word or phrase-by-phrase presentations do not reflect the way we read. The most natural way of getting at online reading behavior is by using eye-tracking. However, eye-tracking has not been widely used in L2 research (but see Dussias, 2010), and for this reason a discussion of eye-tracking is beyond the scope of this entry. Despite the shortcomings of self-paced reading/listening, several L2 researchers have successfully used word-by-word presentation methods which, although they might seem somewhat unnatural, do tap very effectively into online processing.

Self-Paced Listening With Picture Verification

This task has an advantage in that it makes fewer memory demands of the participant than all other tasks, because the picture remains on the computer screen throughout the presentation of the sentence. The most important disadvantage is that the match/mismatch judgment between picture and sentence may make the participants develop expectations which can lead them to develop response strategies. This can be avoided by using a large number of filler sentences.

Onomastics

RICHARD COATES

Onomastics is the branch of linguistics which studies proper names. Proper names and naming are central to human life. We all have personal proper names and may acquire or inherit others, and we live in streets and towns with their own proper names. Our pets, bands, institutions, and businesses may have proper names, and so may any spiritual beings we believe in. We may change our names at important moments in our lives, and acquire variants of those we already have for social reasons. We may spend a great deal of time deciding what proper name, or how many, to give our babies, and even our commercial brands. Such names can be of huge cultural and political importance. It makes a real difference, in a range of ways, to you and to others, whether you are called *Alfred*, *Alf*, or *Alfie*, and whether you live in *Derry* or *Londonderry*.

Orientations

Lexicologists (people who study vocabulary professionally) distinguish two orientations to their subject matter: the *onomasiological* and the *semasiological*. The former begins with a concept and explores how it is expressed using a range of linguistic means (including multilingually), as for example in a thesaurus or a linguistic atlas. The latter begins with expressions in a language and explores their meanings, in the manner of a dictionary. Onomasticians also take part in both kinds of activity. Onomasiological work results in, for example, maps showing the distribution of (near-)synonymous onomastic terms, such as words used in names for hills (e.g., English *hill*, *dod*, *down*, *head*, *knoll*, *law*, *pike*, *mount*, *tor*), or semantically comparable name elements in different languages like *tūn* in Old English, *tre(f)* in Cornish (both meaning ‘farming estate; village’), or in studies of how, for example, gender is expressed in personal names. Semasiological work results in explanations of individual names and terms (e.g., what exactly is or was a *dod*?) and the production of *onomastica* or name dictionaries.

Subject Matter of General Onomastics: Characteristics of Proper Names

At its simplest, onomastics is the discipline which seeks to answer the *semasiological* question “Why is X called X?” This fundamental question may be understood in two ways: as a linguistic and historical one, “Why and how did X come to be called X?”, and as essentially a historical or cultural one, “What does it mean for X to be called X?” The first indicates that onomastics is a specialized branch of etymology, with which it shares its methods, but the second locks it into wider concerns about human history and conventions. The answers to these questions typically intertwine, since knowledge of a proper name’s origin may be part of its present cultural meaning. For instance, it may be important for cultural reasons to know whether (or to believe that) the name of some city was first formulated in one language or a different one (e.g., whether *Cairo* is viewed as Arabic, or as an alteration of an earlier Ancient Egyptian name), or that it may or may not be

relevant to its origin that *Roma* 'Rome' is Latin *amor* 'love' spelt backwards. (It isn't.) The business of onomastics is therefore closely associated with a range of other disciplines which study "human meanings," such as the histories of individual languages, social and local history, genealogy, geography (including all of geology, ecology, human and political geography, exploration, and astronomy), anthropology, law, sociology and demography, individual and social psychology, philosophy (philosophy of language, epistemology, ontology, and logic), and literary and cultural history, to name but a few. The discipline of taxonomy (classification, systematics) may appear to do something similar, but its subject matter is the relation between systematically related objects and concepts (e.g., plants, chemical elements, or the hierarchy of angels) and the common names, that is ordinary meaningful nouns or noun phrases, which express them; and its disciplinary question is rather this *onomasiological* one: "How do we, or should we, express terminologically the elements in system Y (and the relations among them)?"

Proper names differ from other expressions which may in everyday language be called "*names*," such as plant and bird names, and the names of currencies, minerals and the chemical elements. *Polly* is a proper name; *parrot* is not, unless you have chosen to call your parrot *Parrot*. The meaning of the "common name" *parrot* includes whatever it takes to identify any parrot as a parrot and not some other bird, and that information is accessed whenever the word is used; the meaning of *Polly* is simply the set of individuals called *Polly*, irrespective of whether they are female humans, parrots, or whatever, and users generally pick out an individual *Polly* when using the name. Proper names have no lexical content or *sense*, though their *etymology* may be apparent (Coates, 2006).

Proper names (hereafter simply *names*) are therefore clearly different from other linguistic objects, but a totally satisfactory and universally accepted definition has eluded linguists and philosophers. Their essential semantic, or better pragmatic, properties include

- attachment to individuals as a more or less permanent identifying label, that is, a rigid designator (attached to its bearer "in all possible worlds"; Kripke, 1980), whether that label is bestowed on a particular occasion (*Pennsylvania*) or whether it evolves into a name through usage from common expressions (*The Western Isles*);
- the capacity to attract the attention of individuals (*Hey, Jude!*) and to cement interpersonal relations by their use in a context, somewhat like grooming among other primates (*I agree with what you're saying, Richard, but I think we should . . .*);
- the capacity to refer to individuals (people, places, things) in a context with a high chance of success, but without recourse to the meaning of any words or morphemes from which they appear to be structured, that is, they are referring expressions with an extensional denotation but no sense, though their etymological source (and therefore their original sense) can in some cases be easily accessed even by nonspecialist users of the language (as with the surname *Butcher*, the given name, *Dawn*, *Castletown*, *The University of the West of England*).

These three functions might be called the *identifying*, the *vocative*, and the *referential*, respectively. But names differ from other linguistic expressions which might perform the same functions. Common expressions, as we have noted, are those which are able to refer by virtue of the senses of the words, morphemes, and structures which constitute them. The most important thing about a proper name is that when speakers or writers use it, they pick out a single entity but, in doing so, do not make direct use of the senses of any words which appear to make it up. Many names are obscure in any case—they do not consist of words that we can interpret as they stand (like *Warsaw* or *Neptune*). So proper names are, or have become, meaningless, or at least they do not "mean" in the way that ordinary words mean. If a name appears to consist of ordinary words, there may be a problem in

equating what it apparently means with what it can refer to. There is a location name *County Oak* in southern England. It was the name of an oak tree which stood on a county boundary. The oak is dead and gone; the boundary has been moved. But the name is still alive as the name of a community that has grown up near where the original tree was. So when the name *County Oak* is used, speakers do not directly use the meanings of either of the two words, which are still ordinary words of English, and nor do they refer to the thing that the name originally denoted. By contrast, in normal usage, you cannot use the phrase *the old oak tree* without relying on the lexical meanings of *the*, *old*, *oak*, and *tree*, and without respecting the rules of grammar which combine them. Such normal phrases can be used to refer to each and any entity which satisfies the description made by the words, not to just one single entity. But another oak on a boundary would not necessarily be named *County Oak*.

In addition to these properties, names have identifiable general grammatical properties (see Anderson, 2007, pp. 211–92), for example they function like determined noun phrases, and generally resist restrictive modification except for special semantic effects, as in **Diana who has no books only buys magazines*; but they have no known universal phonological or orthographic properties. Names may have particular grammatical, phonological, and orthographical characteristics in individual languages, for instance the special onomastic “article” *o* in Fijian, special case-forms found only in names (e.g., a vocative case-form suffix *-ai* for nouns of the *-as* declension in Lithuanian), and the widespread initial capitalization in the world’s languages which use the Roman alphabet.

Branches of Onomastics

The most frequently recognized branches of onomastics are

- *anthroponymy*: the study of the names of human beings (surnames and other inherited names, given names, pseudonyms), which can be a useful tool in the study of family history;
- *astronymy*: the study of the names of stars (or more loosely of constellations and other heavenly bodies);
- *chrematonymy*: the study of the names of politico-economic, commercial, or cultural institutions; also a catch-all category for the study of the names of other “things”;
- *ethnonymy*: the study of the names of peoples or tribes;
- *hodonymy*: the study of the names of streets or roads;
- *hydronymy*: the study of the names of rivers, lakes, or other bodies of water;
- *literary onomastics*: the study of the names of literary and other fictitious characters;
- *oikonymy* or (latinized) *oeconymy*: the study of the names of houses and other buildings;
- *oronymy*: the study of the names of hills, mountains, or mountain ranges;
- *theonymy*: the study of the names of gods and other supernatural beings, or, in monotheistic religions, of God;
- *toponymy*: the study of the names of places, sometimes in a broad sense including *hodonymy*, *hydronymy*, and *oronymy*, but sometimes (and generally in Europe) used with restricted application to names of inhabited places; and
- *zoonymy*: the study of the (proper) names of animal(s) (e.g., as pets or as economic entities such as racehorses), with subbranches like *hipponymy* (for horses).

In some cases, the local equivalents of these terms are more widely used in non-English European usage than in English. Each of these terms is also used of the set of names or the naming systems in use in particular places (e.g., *Yoruba anthroponymy*, *Slavic hydronymy*,

modern British hipponymy). Strictly speaking, the terms ending in *-onymy* denote the naming systems themselves, whilst their study is called, for example, *anthroponomastics*, but this distinction is not universally observed in the English-speaking world.

Other categories of nameables might be established in different cultures, and their names studied. Such less frequently studied material includes the proper names of epochs and of political events, natural phenomena such as hurricanes, and works of artistic creation.

Methodologies of Onomastics

We started with the simplistic notion that onomastics is a discipline which seeks to answer a fundamental question “Why and how did X come to be called X?” This suggests that the most important methodology is *etymological*. The premise of this approach is that all names were once meaningful (at their creation), even if that meaning is not always readily accessible now, and that the original meaning can be recovered by the methods of historical linguistics and philology, tempered by the influence of source criticism when assessing the reliability of the textual evidence. Probably most British onomastics is of this kind, and most major studies, handbooks, and projects dealing with names have a historical component which may constitute their entire rationale (McKinley, 1990; Gelling, 1997; Gelling & Cole, 2000; Watts, 2004) or at least a central major theme (Coates & Hanks, in preparation). An offshoot of this historical approach is the attempt to use ancient name-material to determine the former spread and distribution of (perhaps defunct) languages (e.g., Sims-Williams, 2006).

But since names are linguistic objects, they can also be studied from the perspective of other linguistic subdisciplines, including some whose methodologies may be interdisciplinary. Let us focus on personal names. They are subject to morphological variation, for instance by suffixation, and that variation can in principle be studied using *quantitative* sociolinguistic methods. Patterns in their bestowal can be classified by phonological (Cutler, McQueen, & Robinson, 1990; Hough 2000), morphological, or semantic criteria. They also appear richly in language use. Their textual functions (identification, vocation, and reference) can be studied as a subject matter of (socio)pragmatics, and their differential appearance in different text types (e.g., literary narrative, reporting, personal announcements in the press) can be studied using the techniques of text linguistics. They also carry social and cultural meanings (connotations, associations); accordingly, they can be studied from anthropological and sociological (specifically demographic) perspectives, and patterns in attitudes to them and effects on their bearers can be studied from social and individual psychological perspectives, all using quantitative methodologies.

An entirely different methodology is involved in the *qualitative*, lit crit, approaches seen in the most usual variety of literary onomastics. This seeks to explain the names of characters in relation to the fictive text in which they appear and the circumstances of the creation of that text. It deals with the relation of cultural and linguistic aspects of names to characters and, overlappingly, with intertextual cultural allusions. This methodology could more narrowly be classed as *hermeneutic* or dealing with interpretation in context.

The Practice and Applications of Onomastics

Accordingly, onomasticians analyze proper names, and treat them professionally, in various ways, some of which are theoretical and/or historical, and others are applied. They may study

- what proper names in general are and what they do (how they are used), in order to refine our understanding of their nature (philosophy of language, logic, grammar, pragmatics, text linguistics);
- the history of individual names or of the names found in particular social groups or areas, to discover their original forms and meanings and establish the history of their social or geographical distributional patterns (etymology, demography, and history);
- the linguistic devices that are used to create names and keep them in circulation, in association with the language or languages of the community that uses them (linguistics of individual languages);
- how ordinary words and phrases may become proper names, and vice versa, and/or how they may be used metaphorically or become associated with entities which are not the original thing named (historical linguistics, lexicology, pragmatics, and rhetoric);
- systems of naming, for example the culturally varying customs, norms, or laws attending the giving or inheriting of personal names or the creation of company names (akin to but not the same as the onomasiological question of the creation and development of taxonomies; anthropology, law);
- current patterns and processes of naming, to establish the distribution and popularity of particular names or name types (anthropology, sociology, demography, social psychology);
- the connotations of names, for example how, or whether, personal names relate to personality or are subject to changes in fashion (individual and social psychology);
- the semasiological question of how different names may apply to the same entity, even in the same culture, for example in pet-naming or nicknaming (variationist linguistics, social psychology);
- the practical problems created by the fact that names are used across linguistic boundaries and that different names may apply to the same entity; for place names, for example, onomasticians may suggest international and standard usages, and resolve disputes about them, or suggest transliterations where different writing systems are involved (human and political geography, cultural history);
- legal aspects of naming, for example the restrictions placed in some cultures on human naming, or brand name protection (anthropology, law); or
- the naming of persons, places, and so forth in second-order worlds such as myth, literature, and film, and in supernatural worlds (poetics, mythology in anthropology).

Onomasticians are also in the business of creating dictionaries of names (*onomastica*, singular *onomasticon*), which typically contain explanatory material of linguistic, cultural, and historical significance. Many people are in the business of creating data sets and databases of name material (e.g., indexers, social statisticians, electoral authorities, credit-rating agencies) which would not qualify as *onomastica* unless they contained explanatory material of a linguistic kind.

The leading general journals in onomastics published wholly or partly in English are *Names* (USA-based), *Nomina* (UK & Ireland), and *Onoma* (international, but often with a European focus). More specialized journals include the *Journal of the English Place-Name Society* and *Journal of Scottish Name Studies*, and there are many regional journals.

Organization of the Second Language Lexicon

JUDITH F. KROLL AND CARI A. BOGULSKI

Overview

Learning and using new words are typically the first steps in acquiring proficiency in a second language (L2). Over the past 20 years, there has been extensive research on the question of how adult L2 learners learn and organize new vocabulary and how the emerging L2 lexicon functions alongside existing lexical knowledge in the first language (L1). This topic has provided a context for evaluating hypotheses about language learning, for testing claims about the architecture of the lexicon, and for examining the interactions across the bilingual's two languages more generally (e.g., Kroll & Tokowicz, 2005).

Three observations frame research on the L2 lexicon. First, the L1 is active when L2 learners process words in the L2 (e.g., Kroll & Stewart, 1994; Marian & Spivey, 2003). Second, L1 activity persists even when individuals become highly proficient in the L2 (e.g., Dijkstra, 2005). Initial research on L2 learning assumed that this activity was restricted to the earliest stages of acquisition; once some degree of proficiency was achieved, learners were thought to be able to understand the meanings of words in the L2 independently of the L1. Subsequent studies have shown that the nature of this activity differs for learners and for proficient bilinguals, but that for all L2 users, the L1 is engaged while processing words in the L2. Third, the parallel activation of words in the bilingual's two languages has the consequence that the native or dominant L1 changes so that the L2 comes to affect the L1. Once a learner becomes sufficiently proficient in the L2, there is activity of the L2 when words in the L1 are processed. These changes occur at the lexical level but they also occur at others levels of language processing, supporting the claim that the bilingual is not two monolinguals in one (Grosjean, 1989).

In the brief entry that follows we first describe models of the L2 lexicon that characterize the representations and processes available to L2 learners and highly skilled bilinguals. We then review the evidence for the parallel activity of the bilingual's two languages that has been observed in studies of visual and spoken word recognition. Finally, we consider the learning process itself, both from the perspective of acquiring a new language as an adult, and also for the consequences that bilingualism may hold for lexical processing.

Models of the L2 Lexicon

Two classes of models have been proposed to account for the way in which words in the L2 are represented and processed. One focuses on the mappings between word forms and meaning (e.g., Kroll & Stewart, 1994). The other characterizes the nature of the lexical and sublexical information that is activated during word recognition (e.g., Dijkstra, 2005). Here we discuss each type of model with illustrations drawn from the two models that have generated the most research on the L2 lexicon, the revised hierarchical model (Kroll & Stewart, 1994) and the bilingual interactive activation model (Dijkstra & Van Heuven, 2002). For further information on lexical models see Thomas and Van Heuven (2005).

Figure 1 The revised hierarchical model (adapted from Kroll & Stewart, 1994)

The revised hierarchical model (RHM) is shown in Figure 1. The model attempts to capture the way in which words in the L2 are mapped to their meanings and to their L1 translations and how those connections are likely to change as learners acquire increasing proficiency in the L2. The RHM assumes that, initially, the L2 learner will have to rely on L1 translations to access word meaning. As skill increases, the L2 learner is hypothesized to become increasingly able to access meaning directly, without mediation via the L1. The solid arrows in the model are intended to depict strong connections whereas the dashed arrows depict weaker connections. The differential strength of these connections is assumed to create an asymmetry between the two languages that is predicted to influence lexical performance.

Kroll and Stewart (1994) tested the RHM by having relatively proficient but L1-dominant Dutch–English bilinguals translate words in each direction: from L1 to L2 and from L2 to L1. The model predicts that translation from L1 to L2 will be conceptually mediated because of the strong existing linkage between L1 words and concepts. However, the model predicts that translation from L2 to L1 will be more likely to be lexically mediated because the word-to-word associations from L2 to its translation equivalent in L1 will make it possible to exploit lexical connections alone and bypass conceptual processing. Kroll and Stewart reported support for this prediction when Dutch–English bilinguals translated words in each direction in the context of word lists that were semantically blocked (e.g., all animals or all vegetables) or randomly mixed. Semantic blocking is a factor that reflects conceptual processing. They found that only translation in the L1 to L2 direction was influenced by the blocked/mixed variable, suggesting that, as the RHM predicts, only that direction of translation is conceptually mediated. Translation from L2 to L1 was unaffected by the presence of semantically blocked information.

In the time since the RHM was proposed, there has been a debate about the role of the translation equivalent in lexical access in the L2. Some studies have reported developmental data that show that there is reliance on the L1 translation when L2 learners are relatively unskilled in the L2 (e.g., Sunderman & Kroll, 2006); other studies have shown that there may be implicit activation of the translation for even highly proficient bilinguals (e.g., Thierry & Wu, 2007). A number of other studies, however, claim that there is no evidence at all for mediation via the L1 translation (e.g., Duyck & Brysbaert, 2004). The apparently discrepant findings in the literature may only be reflecting the observation that whether the translation equivalent is activated when processing the L2 is likely to depend on more than proficiency alone. The task and particularly the time course of processing induced by the task may be critical in determining the conditions under which the L1 translation is engaged.

Models of the L2 lexicon for highly proficient bilinguals also propose that, when words in the L2 are processed, there will be evidence of L1 activity. However, in contrast to

Figure 2 The BIA+ model (adapted from Dijkstra & Van Heuven, 2002)

the notion that it is the translation in the L1 that is active, these models assume that word form relatives in the L1 are momentarily available. The BIA+ model (Dijkstra & Van Heuven, 2002) is shown in Figure 2. The model and its earlier version (BIA) extend the assumptions of the interactive activation model (McClelland & Rumelhart, 1981) for visual word recognition to the bilingual case. When a word is presented, there will be parallel activation of other words that share similar orthography and phonology. In languages that share the same alphabet, like Dutch and English, there will be words that are ambiguous in that they could belong to either or both languages. For example, cognates are translation equivalents that have similar orthography, phonology, or both in two languages (e.g., the word *hotel* in English and Dutch). Interlingual homographs, or false friends, also have similar orthography, phonology, or both, but do not have the same meaning in each language (e.g., the word *room* in Dutch means cream). According to BIA+, at early stages of word recognition all of the activated alternatives in both languages will be available. Only at a relatively late stage of processing will the intended language be selected and the target word identified.

The logic of the empirical studies that have tested the BIA+ model is to compare performance on visual word recognition tasks for bilinguals and monolinguals when words are presented that are either language-ambiguous or language-specific. If bilinguals are able to function as monolinguals when performing a word recognition task in one language

alone, then their performance should resemble that of monolinguals and should not vary across otherwise matched language-ambiguous and language-specific words. However, if both language alternatives are activated even in single language contexts, then bilingual performance would be expected to differ from monolingual performance and to differ for words that are likely to engage the other language. This is precisely the result that has been reported in a large number of bilingual word recognition experiments (see Dijkstra, 2005), supporting the predictions of the BIA+ model. In the next section we consider the nature and scope of the evidence for the parallel activity of the two languages in word recognition.

The Scope of Cross-Language Lexical Activation

Finding evidence for the activation of both languages when Dutch–English bilinguals recognize words in either of their two languages may not seem surprising because of the ambiguities that are possible in similar languages. A critical question is whether the parallel activation of candidates in the two languages is restricted to bilinguals whose languages have this property. Recent studies suggest not. Even when the two languages differ in script, without the possibility of orthographic similarity (e.g., English and Chinese), or differ in modality, as is the case for bilinguals who use one written language and another signed language (e.g., English and American Sign Language), there is still evidence for cross-language activation when only one of the two languages is required (see Kroll & Hermans, 2011, for a review of the recent research on bimodal bilingualism). The persistence of cross-language interactions even in the face of structurally distinct languages suggests that the lexicon is fundamentally an open system at a relatively abstract level. In the language of contemporary connectionist models (e.g., Thomas & Van Heuven, 2005), there is resonance across all of the lexical codes that are engaged during word recognition so that even in the absence of overlap across codes, the remaining codes are activated. The basic findings are similar for both visual and spoken word recognition, although there is some evidence that spoken word recognition may be more open to modulation in the presence of cues to the language in use than visual word recognition (e.g., Ju & Luce, 2004).

The lexicon is engaged not only during reading or listening but also when bilinguals plan speech in each language. Unlike the bottom-up process that characterizes word recognition (see Figure 2), speech production is a top-down process that is initiated by the intention to express an idea, name a picture, or translate a word. The component stages that make up speech planning are complex, even within a single language (e.g., Levelt, 1989). For a bilingual, there is the added requirement to select the language to be spoken. The conceptually driven nature of speech planning should, in theory, allow bilinguals to select the intended language in advance. Despite the potential for early selection and control in speech production, the available evidence suggests that, even when bilinguals intend to speak one of their two languages, information about lexical candidates in the other language is activated (e.g., Costa, 2005; Kroll, Bobb, & Wodniecka, 2006). Quite counter-intuitively, bilinguals do not appear to be able to restrict activation to words in the language they intend to speak. For example, bilinguals are faster to name pictures whose names are cognates, sharing phonology across the two languages, than pictures whose names are distinct translations across languages (e.g., Costa, Caramazza, & Sebastian-Galles, 2000). Similar to the evidence on bilingual word recognition, the research on production suggests that the presence of cross-language interaction affects both of the bilingual's languages, not only production in the L2, which is slower and potentially more open to intrusion from the more dominant language. In addition, like the findings for word recognition, there is evidence that the activity of the unintended language is not modulated by structural differences across languages (e.g., Kroll & Hermans, 2011).

The late control that bilinguals exercise in selecting the words to be spoken has been a topic of great interest in and of itself because it appears to be related to the observed demands on executive function during L2 processing (e.g., Abutalebi & Green, 2007) and to the hypothesized consequence of those demands in conferring enhanced abilities to proficient bilinguals in resolving cognitive conflict (e.g., Bialystok & Feng, 2009).

A very reasonable question that can be raised about the research we have reviewed is whether the apparently pervasive nonselectivity of lexical access is a reflection of the way in which word recognition and word production have been investigated out of context. Bilinguals do not ordinarily read, listen, or speak unrelated words one word at a time in the absence of sentential or discourse context. A critical question is whether the decontextualized nature of research on lexical processes effectively enhanced the level of ambiguity present and thereby induced the observed activation of information in both languages. A series of recent experiments has investigated this issue by examining lexical access within sentence context. To illustrate, Schwartz and Kroll (2006) asked Spanish–English bilinguals to name a cued word that appeared in the context of a sentence presented one word at a time. The cued word was either a cognate or an unambiguous control word and the sentence was either highly constrained semantically or not. They found that, in the highly constrained sentence context, there was no effect of cognate status; the bilinguals performed similarly to monolingual speakers. However, in the absence of a highly constrained sentence context, there was an effect of cognate status that was similar to the one observed in out-of-context word recognition experiments. Other studies have reported the same result using a variety of experimental methods (e.g., lexical decision rather than word naming and recordings of eye movements during reading). The important finding is that reading a sentence in one language alone, even in a block of trials in which all of the sentences are read in the same language, is not sufficient to restrict lexical activation to that language unless the sentence is also highly constrained semantically.

Taken together, the body of recent research on bilingual lexical processing suggests that lexical access is language-nonselective across a wide range of contexts and conditions. Contrary to the view that lexical candidates become active in both languages only in the presence of ambiguity, past research demonstrates that, even when bilinguals have an intention to speak one language alone and even when rich sentence context is present to signal the intended language, there is activation of the language not in use. Given that these cross-language interactions appear to characterize both the learner lexicon and the lexicon of highly skilled bilinguals, we can ask by what process L2 vocabulary is acquired to achieve this transformation from monolingual to bilingual representation. We consider the answer to this question in the next and final section.

Learning and Using L2 Vocabulary

What is perhaps most striking in considering the way in which new words are acquired in L2 is that the processes that characterize learning resemble those that we have described when relatively proficient bilinguals access lexical knowledge. Given the degree of cross-language lexical activation that occurs, it is perhaps unsurprising that L2 learning exploits strategies that make use of such interaction. For instance, reliable similarities in phonology and orthography (e.g., cognates) affect the ease with which new vocabulary is learned. Cognates are both easier to acquire and less likely to be forgotten by L2 learners (e.g., De Groot & Keijzer, 2000). Other word characteristics that are known to play a role in language processing also influence the speed and likelihood of acquisition in L2. Concrete words and high-frequency words, both of which are processed more quickly than abstract and low-frequency words, respectively, are learned more easily and are less likely to be forgotten by L2 learners (e.g., De Groot & Keijzer, 2000). Such results further support the implication of L1 to L2 transfer influencing mature cross-language interaction.

One of the most enduring observations about L2 learning is that it becomes more difficult and is ultimately less native-like the later the age of acquisition (Johnson & Newport, 1989). Curiously, the claims about the consequences of late acquisition that are so robust for L2 grammar and phonology do not appear to apply to vocabulary learning. If learning new words is not constrained by the same factors that determine sensitivity to other aspects of the L2, then what variables can reliably influence this general trajectory of vocabulary learning? As was previously discussed, the role of L1 and L2 similarity, as well as the frequency and concreteness of a word, will impact on vocabulary learning. But, in addition to properties of the words in the developing L2 lexicon, properties of the learners and the learning strategies can also influence L2 vocabulary development. Learning methods (such as keyword, rote rehearsal, paired associate, picture associate, and in-context) all demonstrate some advantages and disadvantages (e.g., De Groot & Van Hell, 2005). Although learners may initially have an easier time acquiring vocabulary out of context and under conditions that are somewhat impoverished, the evidence suggests that this rapid learning does not generalize more broadly to richer contexts (e.g., Prince, 1996). Additionally, some methods may not prove adequate for attainment of a native-like vocabulary, as they are particular to concrete and highly imageable words (e.g., Van Hell & Mahn, 1997). Some recent evidence suggests that alternative learning methods recruit different neural networks during the retrieval process, indicating that variations in learning strategy may have profound consequences for the developing (and ultimately mature) system (Jeong et al., 2010).

Individual learner differences may not only influence ultimate L2 vocabulary acquisition, but may also determine the learning strategy that is adopted. Two learner characteristics that have been the focus of recent studies are general cognitive resources and foreign-language experience. Aspects of cognitive performance that have been demonstrated to affect L2 vocabulary learning include phonological working memory/short-term memory and phonological awareness (Meschyan & Hernandez, 2002), as well as motivation (Sparks, Patton, Ganschow, & Humbach, 2009). Specifically, a higher phonological memory capacity, greater phonological awareness, and increased motivation facilitate attainment of L2 vocabulary. However, there is great difficulty in disentangling all possible variables at play during L2 learning, as these factors tend to be correlated with one another. For instance, an L2 learner with a large L1 vocabulary is likely to exhibit a large L2 vocabulary, but increased L1 and L2 vocabulary are both known to correlate with phonological short-term memory (Meschyan & Hernandez, 2002). Another individual difference known to influence L2 vocabulary learning is foreign-language experience. Several studies testing different types of bilingual participants have demonstrated that previous foreign-language experience leads to better recall of newly learned words (Van Hell & Mahn, 1997; Kaushanskaya & Marian, 2009). Hence, not only do elements of L1 transfer in the learning of L2, but the learning experience of L2 may transfer in the learning of another novel language (L3).

Perhaps one of the most exciting developments in research on L2 vocabulary acquisition is the use of event-related potentials (ERPs), a non-invasive measurement of electrical activity of the brain time-locked to the onset of a stimulus. The methodology has been utilized to study L2 learning of grammatical structures as well as vocabulary, and shows promise as a possible technique for measuring L2 attainment before behavioral evidence suggests that any learning has taken place (e.g., McLaughlin, Osterhout, & Kim, 2004). What these studies suggest is that, despite the extreme difficulty of native-like attainment for adult L2 learners, there are changes in the processing in the brain that can be detected very early in the learning process (i.e., with as little as 14 hours of instruction). Typically, learners at this stage of initial acquisition reveal little evidence of learning when tested by behavioral measures only. These results are very encouraging, both for adult L2 learners and for L2 learning researchers who aim for a finer-grained and more temporally sensitive instrument with which to measure learning.

Summary

In this brief review we have highlighted the dynamic nature of the second language lexicon. Acquired lexical knowledge in the L2 appears to interact with existing lexical knowledge at the earliest stages of learning and in language processing by proficient bilinguals during reading, listening, and speaking. These interactions reflect not only reliance on the more dominant L1 during the acquisition of L2 but the fundamental permeability of the lexicon as L2 comes to influence the use of L1. As such, they hold important implications for the way in which bilingualism and second language learning reveal the constraints and plasticity within the language system more generally.

Orthography

KEITH L. SNIDER

Introduction

The term *orthography* refers to the set of symbols *and the conventions governing their use* that members of a language community employ when they communicate in their language through the medium of writing. Derived from Greek *ὀρθός* (*orthos*) ‘straight, correct’ and *γράφειν* (*graphein*) ‘to write’, the term literally means ‘correct writing’. As such, it is often used synonymously with *writing system*, although the latter also has a more specific meaning. *Writing system* also refers to the relationship between the symbols of an orthography and the particular type of linguistic units that they represent: words versus syllables versus phonemes (Coulmas, 1989, p. 37). Phonemes are the contrastive sounds in a language that minimally distinguish words (e.g., /b/ vs. /d/ in *big* and *dig*). Within the present work, use of the term *writing system* is limited to this second, more restricted meaning, and it is not synonymous with *orthography*, but is rather one facet of an orthography.

Broadly speaking, writing systems fall into two groups: meaning-based and sound-based. Meaning-based systems are *logographic* and link individual symbols to semantic concepts (usually morphemes, or syllables if morphemes are monosyllabic). On the other hand, *sound-based systems* link individual symbols to phonological units: syllables, in the case of *syllabic* writing systems; moras, in the case of *moraic* systems; and phonemes, in the case of *alphabetic* systems. Even though the German and Spanish orthographies are very different, they have the same writing system because both are alphabetic. In this way, they contrast with languages like Chinese and Amharic, where each has different writing systems because they employ logographic and moraic systems, respectively.

Perhaps the best known example of a logographic writing system is the traditional Chinese one, in which there is primarily a one-to-one correspondence between symbols and morphemes. Developed over 4,000 years ago, the Chinese characters were originally pictographic. Today, most characters consist of ten or fewer strokes that are only partly reminiscent of their original pictographic status. One major advantage of logographic systems over alphabetic ones is that because the symbols are linked to concepts instead of sounds, they are better able to serve language communities with multiple dialects. This may be seen in the following examples of the word for ‘fish’ in different Chinese dialects (data courtesy of Jamin Pelkey). Although ‘fish’ is pronounced differently in each dialect (some of the differences are tonal), speakers of all dialects are nevertheless able to use the same character to represent it orthographically because they employ a logographic writing system.

魚

‘fish’

Beijing (Mandarin)	/jy/ (high rising tone)
Cantonese (Yue)	/jy/ (low falling tone)
Kunming (SW Mandarin)	/zy/ (low falling tone)
Taiwanese (Min Nan)	/hi?/ (mid falling tone)

Middle Chinese	*ŋjo
Old Chinese	*ŋja

* Reconstructed proto-forms

Despite the obvious advantages of logographic systems for languages with multiple dialects, it is much more difficult to learn to read with such a system because there are so many symbols to memorize. Rogers (2005, p. 44) claims that beginner readers of the traditional Chinese system need to master at least 1,500 characters for just basic literacy and 2,500–3,000 for functional literacy. All told, there are some 50,000 characters in existence. Also, because logographic systems have so many characters, the shapes of many characters end up being fairly complex in order to maintain individual contrasts. This only adds to the difficulty in learning to read and write them and helps to explain why not very many languages today have writing systems of this kind.

With respect to syllabic writing systems, Poser (1992) claims that most of these are actually moraic (e.g., Amharic), however, he acknowledges that true syllabic writing systems do exist, and he describes the system of Yi, a Tibeto-Burman language spoken in China, as being one of them. Moras are units of syllable weight and consist of either a simple nucleus, a coda, or one-half of a long vowel or diphthong syllable. Unlike coda consonants, which do contribute to syllable weight, onset consonants, regardless of their complexity, do not contribute to syllable weight. Light syllables therefore consist of a single mora (e.g., V or CV), while heavy syllables consist of two or more moras (e.g., CVV or CVC). A true syllabic system would therefore represent a syllable like *fit* with one symbol; a moraic system would represent it with two, one for each mora (nucleus and coda); and an alphabetic system would represent it with three, one for each phoneme. The main advantage of sound-based writing systems over meaning-based systems is that sound-based systems have fewer symbols to memorize, and this makes learning to read much easier. By the same token, alphabetic systems, which are employed by most orthographies today, are easier to learn than syllabic and moraic ones because, again, they have fewer symbols to memorize.

Returning to issues of terminology, the term *orthography* should not be confused with the term *alphabet*, which refers only to the set of symbols, or letters, that represent the phonemes of a particular language. Accordingly, the English alphabet has 26 letters, the Swedish one has 29, and the traditional Spanish one has 30, even though all three languages have the same type of writing system (viz., alphabetic), and all three share the same Roman script. The term *orthography* should also not be confused with the term *script*. A script is a large set of symbols from which the symbols that constitute the alphabet of a particular language are drawn. Scripts, like writing systems, are therefore not language specific, but may be shared by other languages. For example, English, German, and Spanish all share the Roman script, while Russian, Ukrainian, and Bulgarian all share the Cyrillic script. The following table shows some correspondences between the Roman, Cyrillic, and Greek scripts in order to demonstrate how the same phonemes are represented differently by these scripts.

Phonemic	/n/	/l/	/b/	/g/	/r/
Roman	n	l	b	g	r
Cyrillic	н	л	Б	г	р
Greek	ν	λ	β	γ	ρ

Alphabetic orthography symbols and the conventions that govern their use fall into three main groups: graphemes (symbols that represent phonemes), diacritics, and punctuation marks. Conventions that govern the use of graphemes are virtually unlimited, but here are a few that are commonly employed.

1. Use of one grapheme to represent one phoneme. In English, symbols such as *m*, *k*, and *r* each represent one phoneme, namely /m/, /k/, and /r/, respectively. This is the ideal situation.
2. Use of one grapheme to represent multiple sounds. In English, *c* is usually pronounced as [s] before the front vowels [i] and [e] (e.g., *cistern*, *cement*), but sometimes also as [ʃ] (e.g., *social*, *ocean*), and as [k] elsewhere (e.g., *cavity*, *corrupt*).
3. Use of two graphemes (digraph) to represent a single sound. In English, *ph* is pronounced [f] (e.g., *photograph*, *phrase*) and *ch* is pronounced [tʃ] (e.g., *chip*, *much*).
4. Some conventions simply dictate how to pronounce words when their pronunciation would not otherwise be obvious. In English, beginner readers are often taught the ditty, “When two vowels go walking, the first one does the talking,” so that when they come upon a vocalic digraph (i.e., two vowels), they pronounce only the first vowel (e.g., *boat*, *leave*).

Diacritics are often added to graphemes in order to modify their sounds in a consistent manner. In French, for example, a *cedilla* is placed below a *c* when it is necessary to indicate that it is pronounced [s] instead of [k] (cf. *façon* ‘way, manner’ with *faconde* ‘fluency’). Many African languages also use accent marks to modify sounds by indicating tonal distinctions. In this Bafut proverb from Cameroon (Ntumngia & Mfonyam, 2004), the different accent marks represent different tones, *ɲgɛ̃ ɲgyâ àf̃ agha’a à wo a ataa nì àtù* ‘A stranger antelope in a far off field falls headlong in the pit’ (translation: ‘Look before you leap’). Diacritics, however, are not always associated with consistent sound modifications; they can also convey added meaning regardless of what sounds are associated with that meaning. In French, for example, a grave accent is placed above the *a* in *là* ‘there’ to distinguish it from *la* ‘the’, even though both are pronounced identically.

Punctuation marks (e.g., commas, colons, and hyphens, etc.) are the third type of orthographic symbol and typically convey information that is represented suprasegmentally in spoken speech by means of pauses, vowel length, intonation, and so forth. Grammatically, they can demarcate the boundaries of syntactic constituents like phrases and sentences, distinguish questions from statements, and indicate morphological processes such as compounding and reduplication.

Since alphabetic systems are the most common systems in use today and are arguably the most practical, the remainder of this entry explores some of the more important issues that relate to developing alphabetic orthographies for preliterate societies.

Factors in Orthography Development

There are a number of different factors to consider when developing an orthography, and many of these are sociolinguistic in nature. Sometimes governments impose restrictions on orthographies, particularly with regard to what writing systems, scripts, or both, are used. While a particular script might work well for some languages, it often does not work as well for other languages if it doesn’t have enough characters to encode all of the phonological contrasts that need to be distinguished. Decisions therefore need to be reached regarding how best to adapt imposed systems for minority languages like these. Often, people want their orthographies to resemble those of majority/national languages so that people can more easily transfer their literacy skills to the majority languages. Other times,

however, people want the orthographies of their minority languages to be different from the majority languages in order to enhance their ethnic identities. Difficult decisions also often have to be reached regarding which dialect will be chosen as the “standard” dialect. And finally, whatever technical limitations might exist for a society, they need to be taken into consideration in order to ensure that all orthographic symbols can be printed locally.

Linguistic considerations are also very important; all other things being equal, an orthography that is closely aligned with the phonological and grammatical structures of a language will serve the language community better than one that is not so closely aligned. We look now at two of the most difficult challenges for developers of linguistically based orthographies, orthographic depth and tone.

Orthographic Depth

The term “orthographic depth” refers to the degree to which the relationship between a language’s orthography and its phonology is unequivocal or transparent. “An orthography that represents its phonology in an unequivocal manner is considered shallow, while in a deep orthography the relation of orthography to phonology is more opaque” (Frost, 1992, p. 258). Depending on the number and nature of a language’s morphophonemic alternations, some languages (those with fewer and more transparent alternations) lend themselves better to shallow orthographies, while others lend themselves better to deeper orthographies. Shallow orthographies, like those of Spanish, Italian, and Finnish, have mostly one-to-one correspondences between graphemes and phonemes. This makes learning to read easier because when readers see a particular grapheme, they immediately know how to pronounce it. Deep orthographies, on the other hand, like those of French, Danish, and English, have fewer one-to-one correspondences and are generally more difficult to learn to read because the correspondences between the graphemes and their pronunciations are more opaque. That being said, for any given language, mature readers can often read faster with a deep orthography, since they focus more on associating meanings with word shapes than they do on sounding out words.

There are many factors that can contribute to orthographic depth, however, due to space limitations we will focus only on the one that is arguably most problematic for orthography developers, that attributable to morphophonemic alternations. Morphophonemic alternations occur when any given morpheme has different phonetic realizations in different phonological environments. In English, for example, the present tense morpheme has three phonetic realizations: [s], [z], and [ɪz], with [s] occurring after voiceless consonants (e.g., [klæp-s] ‘claps’), [z] occurring after voiced consonants and vowels (e.g., [rɒb-z] ‘robs’, [go:-z] ‘goes’), and [ɪz] occurring after consonants whose places of articulation are identical or similar to that of [z] (e.g., [bʌz-ɪz] ‘buzzes’). Despite the fact that native English speakers are very aware of the difference between [s] and [z] in words like *sip* versus *zip*, they are relatively unaware of the differences between the present-tense forms for *claps*, *robs*, and *buzzes*, and they have no problem recognizing these as reflexes of the same morpheme.

In cases like these, a deeper orthography that allows multiple mappings between phonemes and graphemes is preferable to one that does not. Accordingly, the English orthography represents both the [s] and the [z] of the present tense realizations with the grapheme |s|. Orthographic depth attributable to multiple mappings like these is therefore good because native speakers are not very aware of the morphophonemic alternations. Examples like these have led a number of researchers (e.g., Chomsky & Halle, 1968) to conclude that the phonological underlying form is the ideal candidate for orthographic representation since it results in a consistent realization for each morpheme. And indeed, if native speakers were generally unaware of all morphophonemic alternations, this would no doubt be the case. However, not all morphophonemic alternations necessarily occur below the level of native awareness.

In Chumburung, a Kwa language spoken in Ghana (personal field notes), vowel harmony exists between the vowels of stems and prefixes, the latter always harmonizing with the former with respect to the feature advanced tongue root (ATR). In addition, the *kl-* noun class singular prefix harmonizes with the round specification of the stem. The following examples are illustrative.

(1) Vowel harmony between stems and *kl-* prefix in Chumburung

	-ATR		+ATR	
-Rd	kì-síbɔ́	ear	kí-jíʔ	tree
	kí-kéʔ	head pad	kì-téʔ	story
	kì-pá	hat	kì-jéʔ	meat
+Rd	kù-kòtɔ́	claw	kù-ńú	head
	kù-kɔ́	debt	kú-dʒó	yam

Unlike voicing assimilation in English, native speakers of Chumburung are very aware of the phonemic differences between the vowels of the *kl-* prefix, and much less aware of the fact that the different surface forms are reflexes of the same morpheme. At one point a linguistically naïve Chumburung speaker was asked if it wouldn't be better to have just one form for the *kl-* prefix, and to spell words like *kù-kùtí* 'orange' as [kíkùtí]. He was aghast, and the subsequent conversation very quickly revealed that he was totally unaware of any connection between the four surface realizations of the prefix and that any deviation from a phonemic representation on this point would be totally unacceptable. Further testing of this with other native speakers resulted in the same conclusion.

From the foregoing, it should be clear that a strictly phonemic orthography is not always the best solution (e.g., English) and that a strictly morphophonemic one is not always either (e.g., Chumburung). For any given morphophonemic alternation, it is therefore necessary to discern to what extent native speakers are aware of the different pronunciations. If they are aware of them, then a phonemic spelling (i.e., shallow) is preferred for that situation. But if they are not aware of them, then a morphophonemic spelling (i.e., deep), which provides a single representation for the morpheme in question, is preferred.

Establishing which sounds native speakers are aware of is not particularly easy. However phonological theories such as lexical phonology and stratal optimality theory (Kiparsky, 1982, 1985, 2000) that employ a serial approach to phonological processes offer a promising solution to this problem. Mohanan (1982, 1986) claims that native speakers are psychologically more aware of the output of the lexical level of these models than they are of any other phonological level (e.g., underlying form, postlexical form, etc.). To the extent that Mohanan's claims are true, these theories provide an objective means for non-native speakers of a language to help develop orthographies that represent words as native speakers perceive them to sound. With regard to the English present tense voicing assimilation examples above, Kiparsky (1985) argues that the processes responsible for these alternations occur postlexically. Since the claim is that native speakers are not particularly aware of the output of postlexical processes, there is a principled reason why native speakers of English prefer not to write the output of voicing assimilation, preferring instead to write a single representation for this morpheme. With regard to the Chumburung vowel harmony examples above, Snider (2011) argues that these forms are the output of *lexical* processes, which again provides a principled reason why native speakers prefer to write these words the way they do.

Tone

Given that some 60–70% of the world's languages are tonal (Yip, 2002, p. 1), another serious challenge for developers of orthographies for preliterate societies is how best

to represent tonal distinctions orthographically. Developers of orthographies for tone languages often find it helpful to distinguish between “lexical tone” and “grammatical tone.” In the case of the former, tonal contrasts help to distinguish lexical items, while in the latter, they distinguish grammatical categories like tense or aspect. Often, individual languages employ both types. Here are some examples from Acatlán Mixtec, an Oto-Manguean language spoken in Mexico (data from Pike & Wistrand, 1974, p. 84) and Kenyang, a Wide Bantu language spoken in Cameroon (personal field notes). In these examples, the different accent marks represent the following: acute (dó) = high tone, grave (dò) = low tone, macron (?ō) = mid tone, circumflex (kô) = falling tone, and a down arrow (↓pá) = downstepped (lowered) high tone.

(2) Lexical tone contrasts in Acatlán Mixtec

dò?ò	basket	ʔĩĩ	salt
dò?ò	mud brick	ʔĩĩ	skin
dó?ò	tail	ʔĩĩ	hail

(3) Grammatical tone contrasts in Kenyang

Perfective		Imperfective	
bá-pá	they spat	bá-↓pá	they are spitting
bá-kô	they walked	bá-kô	they are walking

Orthographically, tone has been handled in a variety of ways, some of which have worked well, and some not so well (see also Bird, 1999 and Snider, 2001). Not marking tone at all is probably the most common strategy employed. In this case, orthography developers assume, whether naïvely or otherwise, that the functional loads of lexical and grammatical tone in the language are light enough not to warrant representing tone. To the extent that these assumptions are justified, this can be the preferred solution, since it definitely makes writing easier. On the other hand, if the functional load of tone is too heavy, not marking tone can cause serious difficulties in reading comprehension. In this case, it is better to determine which tonal contrasts native speakers are aware of, and to represent them accordingly.

Conclusion

Orthographies do not have to be linguistically perfect in order to be successful. This becomes especially clear when one considers those of English and especially ancient Chinese. Although less than ideal for many reasons, they have nevertheless proven very successful because the societies that own them place an extremely high value on literacy. That being said, the majority of societies where new orthographies are being developed today are not as highly motivated for mother-tongue literacy as are English and Chinese speakers, nor do they normally have the same resources available for language development. Those responsible for orthography development in preliterate societies, therefore, need to ensure that orthography decisions taken are based on solid linguistic research and are made only after carefully considering all of the factors involved. We conclude by summarizing these factors.

First, governments sometimes impose restrictions on orthographies, so careful consideration must be given to developing an orthography in a manner that takes these into account. Second, language communities sometimes have conflicting desires with respect to the extent to which their orthography should resemble a national language, and these must be determined and a course of action agreed upon. Third, the dialect situation must be

determined and a decision taken regarding which dialect will be chosen as the “standard” dialect. Fourth, whatever technical limitations might exist for a society need to be taken into consideration in order to ensure that all orthographic symbols can be printed locally. And finally, an orthography should be aligned as closely as possible with the phonological and grammatical structures of the language in question.

O'Toole, Michael

KAY L. O'HALLORAN

Michael O'Toole, also known as Lawrence M. O'Toole (1934–), Emeritus Professor of communication studies at Murdoch University, Western Australia, has a long and distinguished career in applied linguistics, including the development of pioneering approaches to language studies and multimodal semiotic analysis, culminating in his highly influential systemic functional (SF) approach to displayed art, which has provided a foundation for contemporary multimodal research.

Professor O'Toole studied Russian in the Royal Navy during 1951–3. He was highly critical of the “grammar-translation” approach which prevailed in language teaching at that time, whereby students learnt the structures of the target language but were unable to converse in social situations due to lack of knowledge about the relations between text and context.

In his first teaching post in the Department of Russian at Liverpool University, O'Toole experimented with the audiovisual methods developed in *Voix et Images de France* (CREDIF, 1961) by applying Russian dialogue to professional French filmstrips. He moved to the new University of Essex in 1964, where he was in charge of Russian language teaching in the Language Centre. He worked on a research project recording and analyzing contemporary texts of spoken and written Russian and here learned the basic theory and methods of M. A. K. Halliday's scale and category grammar, later called systemic functional linguistics (SFL). Advances in tape-recording technology and techniques in the early 1960s, together with the new stress on learning language in realistic social contexts, made audiovisual methods and language laboratory learning the standard approach at Essex and other forward-looking universities.

O'Toole was commissioned by the BBC to produce a new radio course for Russian learners in 1965. *First Year Russian*, written jointly by O'Toole and Terry Culhane, was the third such BBC course, but it was groundbreaking in that it avoided the traditional set-piece social situational structure and instead built a continuous story line around the encounters and adventures of Boris Petrovich, a Kievan visitor to Moscow. This allowed for the development of interpersonal aspects of language use (e.g., character, relationships, and mood) which were rarely found in more prosaic “situational” courses. The dialogues were constructed around knowledge about grammar and vocabulary emerging from O'Toole's earlier work, and each broadcast finished with a song in Russian written and performed by O'Toole, providing a valuable multimodal memory aid to Russian phrasing, vocabulary, and intonation. Accompanying printed materials were developed to supplement the dialogues which radio listeners were hearing twice a week through 1966 and 1967. A follow-up course, comprising the same elements and principles, was written and broadcast by O'Toole in 1968 and 1969. Both radio courses and supplementary materials were published by Oxford University Press under the titles *Passport to Moscow* (O'Toole & Culhane, 1972) and *Passport to Odessa* (O'Toole, 1976).

O'Toole was involved in an ambitious and popular MA in applied linguistics in the Department of Language and Linguistics at Essex University (which M. A. K. Halliday and Ruqaiya Hasan joined in the early 1970s). O'Toole taught units in SFL, stylistics, and semiotics as a counterweight to the prevailing transformational-generative grammar courses.

O'Toole was also interested in Russian and English literary stylistics. Most of the literary studies he had encountered had a heavy bias toward social and cultural history, authors' biographies, and a rather unsubtle search for Freudian or Jungian archetypes. His discovery of the Russian Formalist writers, initially through Victor Erlich's (1969) magisterial *Russian Formalism: History—Doctrine*, guided O'Toole toward a structural and stylistic study of Russian and English short stories. A number of other Russian literature specialists joined him in establishing the Neo-Formalist Circle, an offshoot of the British Universities Association of Slavists, to explore and apply the principles of Formalist criticism which focuses primarily on the text of the work itself, in terms of language and structure. Dr Ann Shukman and O'Toole founded an occasional journal, *Russian Poetics in Translation* (twice yearly, 1975–82), which permitted works by Russian scholars to become accessible to a Western audience.

Much of O'Toole's work at this time was produced as conference papers and journal articles, but in 1982 he published a major study bringing together his own (neo-Formalist) theory of narrative structure and the close (SF) analysis of prose style in *Structure, Style and Interpretation in the Russian Short Story*. In 1988 he edited, with David Birch, a collection of papers on style by SF linguists, including themselves, entitled *Functions of Style*.

When O'Toole moved to Western Australia as professor of communication studies in 1981, his main teaching and research was in SFL, narrative theory, and general semiotics. As a lover of the visual arts, he was dissatisfied with the degree to which the discussion of paintings, sculptures, and buildings was dominated by considerations from outside the artwork itself, mirroring the problem with literature studies before the Formalists. By 1985, O'Toole foresaw that a natural extension of SFL would be a visual semiotics based on SF principles and methods of analysis. He presented the new theory to M. A. K. Halliday and other leading systemic linguists at the University of Sydney in February 1986, and over the next few years he continued to analyze paintings and famous buildings and sculptures. In 1994 he published the seminal *The Language of Displayed Art*, where he tested the range and flexibility of the SF semiotic model, explored the theoretical issues which it brought to light, and seriously questioned the hegemony of art-historical discourses, while allowing—indeed, insisting—that with art the interpretation is always open. The book was republished in revised and extended form by Routledge in 2011. Closely linked with the book is a CD-ROM, *Engaging With Art* (O'Toole, 1999), an expanded version of which is packaged in Routledge's republication.

O'Toole's theoretical categories and methods have been applied successfully to individual artworks and buildings by colleagues and graduate students in several cultures, and the model has also clearly influenced the fast-growing area of museum studies. O'Toole's most recent work for conference presentations and publications has focused on animated film and TV comedy, extending his long-standing interest in static visual art.

Otto, Frank

MICHAEL D. BUSH

Introduction

The creation in 1981 of CALICO (Computer-Aided Language Instruction Consortium) represented a significant chapter in the history of computer-aided language learning, and Dr. Frank Otto played a preeminent role in that development. As a professor at Brigham Young University (BYU) in Provo, Utah, and working with and through CALICO as well as through his own private efforts, Otto has had significant impact on what was initially known as computer-assisted instruction (CAI) for language learning. He later referred to his work in “interactive multimedia,” but the field is perhaps most widely known today as computer-assisted language learning (CALL).

Background and Education

As brief background to his life and career, Otto was born October 7, 1936, in Cleveland, Ohio. He joined the National Guard in 1952 at the age of 16 while in high school and a few months later began two years of playing baseball with the Cleveland Indians organization. Unfortunately, after deciding to go to college, he learned that he was not eligible for a sports scholarship because he had played professionally. Luckily for Otto, Baldwin-Wallace College in Berea, Ohio, recognized that his potential extended to areas other than sports and offered him an academic scholarship. He also supported his education by working as a professional musician all through college, a “keyboard jazz-man,” playing in jazz combos in various settings such as supper clubs (F. Otto, personal communication, October 22, 2010).

After graduating from Baldwin-Wallace College, he pursued a Master’s degree in Spanish language and literature from the University of Wisconsin at Madison graduating in 1960 and also receiving his state certification as a teacher in Spanish, History, and English. He went on to earn his PhD in 1966 in educational administration and curriculum development, also from Wisconsin. He says that he chose this area because it gave him the most flexibility in choosing minors, which enabled him to “do materials development,” which had already captured his interest (F. Otto, personal communication, October 22, 2010). In addition to pursuing this concentration during the PhD program at Wisconsin, Otto worked a great deal in teacher education, something that he had always known that he wanted to do.

He ultimately completed his dissertation in the area of foreign languages in the elementary school, working with *Parlons Français*, a program from Heath de Rochemont, a division of D. C. Heath. The company supported Otto’s dissertation research to investigate alternative approaches to staffing foreign language programs, which also provided him opportunities to travel (F. Otto, personal communication, October 22, 2010).

Just as did most other language educators of the day, Otto became quite interested in audio-lingual methodology. That interest as well as the work with D. C. Heath prompted his involvement in what was known at the time as “programmed instruction,” which he pursued with funding from the National Defense Education Act (NDEA). He maintains even today that the motivation was correct to move away from linear instruction in order

to address the needs of the individual better, the goal of programmed instruction. "These textbooks just could not quite do what we had in mind," he says however, "but we kept trying."

The "high technology" of the era, which Otto investigated in his dissertation research, involved broadcasting the *Parlons Français* program to over two million schoolchildren, at times from a DC-3 airplane flying over the Midwest. The costs for these programs ran to over \$3 million for development as well as costs for trials and subsequent revision (Otto, 1968a). To put those numbers into perspective, the Consumer Price Index Calculator of the United States Department of Labor, Bureau of Labor Statistics indicates that such an effort would total over \$21 million today, after taking inflation into account (CPI Inflation Calculator, *n.d.*).

Following his PhD program at Wisconsin, Otto began his career in 1966 as a university professor at The Ohio State University in Columbus. Also that same year, he became a founding member of Teaching of English to Speakers of Other Languages (TESOL) and the National Association of Bilingual Education (NABE).

Otto later joined Dr. Edward D. Allen in what was the first PhD program in foreign language education in the USA, which had been founded only a few years earlier. His early research involved investigations into ways to individualize instruction through methods involving team teaching (Otto, 1968b). At Ohio State he also served as coordinator of the efforts in Spanish in that program and often played handball with Dr. Paul Pimsleur, the creator of the "Pimsleur language learning system" that is still widely known today. Pimsleur was on the language faculty and directed the language laboratory, the "Listening Center" (http://en.wikipedia.org/wiki/Paul_Pimsleur). Otto remembers conversations with Pimsleur regarding where language learning was going with respect to technology. For example, Dr. Pimsleur stated at one point, "Frank, I think you've got it there. It is going to wind up on the computer!" (F. Otto, personal communication, October 22, 2010).

He left Ohio State in 1972 to serve as director of the Language Institute, University of the Americas in Mexico and Puebla, Mexico. During his time there, he worked as a language program consultant to the US embassies in Mexico, Guatemala, Honduras, Ecuador, Panama, Costa Rica, El Salvador, Columbia, language centers throughout Latin America as well as Asia, mainly in the Philippines. He also served on the advisory committee on learning technologies for the developing world that was organized by the Institute for International Research of the US Agency for International Development.

Service at Brigham Young University

Otto went to Brigham Young University (BYU) in 1975, primarily because people there wanted to develop a program in English as a second language. After arrival at BYU, he was instrumental in founding the English Language Institute. He was also able to return to his interest in CAI after connecting to the TICCIT Project (time-shared, interactive, computer-controlled information television), which was first developed by the MITRE Corporation in 1968. After TICCIT was expanded in a project at the University of Texas at Austin and at Brigham Young University, Otto created that same year what appears to be the first interactive multimedia program for teaching Spanish online. A large measure of this work had its genesis in a connection he developed with the Montevideo project that was underway in the McKay Institute in BYU's College of Education. That seminal project culminated in the development of an interactive videodisc for teaching Spanish through the simulation of a visit to a Mexican village (Gale, 1983). This led to phone calls from various commercial entities as well as from the federal government as to how to apply the computer to language learning.

The next phase of Otto's career had a significant turning point when he met Mrs. Minnie Kenny, the deputy commandant in charge of training at the National Cryptologic School (NCS) in the National Security Agency (NSA). The agency had been exploring the possibility of working with the McKay Institute in BYU's College of Education to develop and use interactive videodisc technology to train operators on some of the very expensive equipment used at NSA. Those discussions quickly turned to language training requirements, which prompted the McKay Institute team to establish connections with the College of Humanities, which included Otto as well as Dr. Randall Jones (L. Gale, personal communication, May 10, 2011).

Otto first met Mrs. Kenny in 1982 at the Defense Language Institute (DLI) in Monterey at what he calls a "benchmark event." This would have been the third FLINT (Foreign Language Instructional Technology) conference conducted by DLI and the Goethe Institute of San Francisco (Mace, 1982), itself also a gathering of key individuals who pioneered developments in CALL.

Otto quotes Mrs. Kenny as saying during their initial contacts, "I am a person interested in making teaching and learning more enjoyable" or as he recalls her saying, "less boring" (F. Otto, personal communication, October 22, 2010). Their connection led to his involvement in the expansion of the needs assessment that the McKay Institute was conducting with the NCS, the organization within NSA that was also charged with language training. Otto found this initial work fascinating and something that he still sees "today as if it happened yesterday."

The contact with Mrs. Kenny blossomed into a far-reaching association that led to meetings with the director of NSA at the time (P. Aoki, personal communication, October 18, 2010). Guided by what colleagues described as the charismatic efforts of Mrs. Minnie Kenny, Otto embarked on various noteworthy endeavors. The first was the implementation of technology in language learning, specifically an interactive videodisc, during which he was able to combine work across multiple organizations. The initial work with NSA led to projects with the Defense Language Institute (DLI), with Otto becoming the point of the spear that was the team from BYU and Utah State University (A. Rowe, personal communication, May 2, 2011).

The project with DLI led to a series of videodiscs for German (VELVET: video enhanced learning/video enhanced testing), which involved repurposing video from various sources, as well as original materials (Rowe, 1985) videotaped on location in Germany. Otto's team also produced videodiscs in six other languages (Spanish, Arabic, Hebrew, Korean, French, and Russian) in their project with the National Cryptologic School. The more lasting influence of that period, however, was the founding of an international organization as well as a scholarly journal.

More importantly, however, he played a key role in creating an infrastructure that would live beyond those early efforts and the initial federal funding. Dr. Randall Jones, former dean of the College of Humanities at BYU summarizes what he says was Otto's "contribution in a nutshell." "Frank had vision, found funding, and put together an organizational structure to promote CALL" (R. Jones, personal communication, October 18, 2010).

Early Organization of CALICO

Running parallel to those early development efforts was the founding of CALICO, which was organized at BYU with seed money made possible through the efforts of Mrs. Kenny. Building on the early development efforts at BYU, CALICO rapidly became an organization with an international membership. The organization has brought people together from industry, government, and educational institutions to explore the development and

application of new technologies for teaching and learning languages. A significant part of that work was also the creation in June 1983 of the *CALICO Journal*, which is still today a major research journal in the field.

As an interesting historical note, the masthead of the *CALICO Journal* today refers to the name of the sponsoring organization as the “Computer-Aided Language Instruction Consortium.” The masthead of early issues of the journal, however, referred to the “Computer-Aided Language Learning and Instruction Consortium.” As late as 1986 in an interview with M. Uchida from the Japanese language newsletter, *Future*, Otto (personal communication) identified the organization using the earlier version of the name, but at some point between 1990 and 1991, the date of the first issue journal to list the shortened name, the name was changed and the word “learning” was dropped. It seems that the name change might have been connected to CALICO’s move from Brigham Young University to Duke University. This could well remain only speculation at this point, given the passing in 2007 of the second executive director, Frank Borchardt (Duke University, 2007). More importantly, however, is the crucial role that Otto played in the founding of the organization.

ELLIS, Inc.

After leaving BYU, Otto continued his efforts in the use of technology for teaching language, which culminated in an interactive model for English learning and teaching. He was able to achieve a level of commercial success through ELLIS, Inc., a company founded from the outset to foster the creation and sale of programs to promote English competency to “millions of children and adults worldwide” (Spoke, 2011). Pearson Learning acquired ELLIS in 2006 and continues to improve and sell the software (see www.pearsonschool.com/ellis).

Output-Based Instructional Approaches

PAUL D. TOTH

Introduction

The ability to express oneself in a second language (L2), or make spoken or written *output*, is among the most desired outcomes for L2 instruction. However, while most would agree that uninhibited output is an essential objective, views vary on its role in L2 acquisition and the optimal format for output-based instructional techniques. For example, cognitive theory generally sees output as the indirect manifestation of an internal linguistic system whose development principally occurs by processing, or attending to and comprehending, L2 *input*. Within this paradigm, output does not so much cause acquisition as simply reflect it, although many also believe that output builds fluency by “proceduralizing” L2 communicative routines. Meanwhile, sociocultural theories see L2 learning more as building participation in L2 communities than as acquiring an abstract system. Hence, output is an essential catalyst for development as learners become socialized into L2 communicative practices and are more able to regulate themselves and their environment through language. Despite these differences, however, both cognitive and sociocultural theories generally advocate a communicative approach to instruction, where efforts to ensure use of specific L2 structures are closely linked to meaningful, purposeful language activity, as in current proposals for “task-based” instruction.

In addition to these current perspectives, traditional views of output and acquisition continue to influence L2 instructional practices, despite their abandonment by current theory. These include (a) the mid-20th-century behaviorist view that L2 “speech habits” can be trained through error correction, dialogue repetition, and the mechanical manipulation of grammatical structures; (b) the belief of early 20th-century philologists in L2 learning via literary translation and grammatical rule recitation; and (c) the perspective of 19th- and 20th-century educators that first and second language learning are identical processes, such that L2 output emerges naturally and effortlessly among adults. Respectively, these views derived the (a) audio-lingual, (b) grammar-translation, and (c) “direct” methods, whose remnants are still found in many classrooms. Output-based instructional approaches thus vary wherever L2s are taught, as divergent beliefs about the nature of language and acquisition influence the motivation and design of L2 production activities.

The Nature of Language Production

L2 output, particularly in spoken form, is a complex activity that involves the highly synchronized and nearly simultaneous coordination of mental and physical processes at different levels. Following Levelt’s (1989) widely cited model of speech production in Figure 1, an essential step involves assessing one’s goals and motives for interaction, as well as those of interlocutors, and “conceptualizing” a message within the discourse context (box, top left). The complexity of this single step, and the sociopolitical and emotional factors that impinge on it, is the focus of much sociocultural research on L2 output. Once an intended meaning has been determined, speakers must “formulate” an utterance

2 OUTPUT-BASED INSTRUCTIONAL APPROACHES

The Speaker as Information Processor

Figure 1 A blueprint for the speaker. Levelt, William J. M. *Speaking: From Intention to Articulation*, Figure 1.1, p. 9 © 1989, Massachusetts Institute of Technology, by permission of the MIT Press

(middle left), selecting lexical and grammatical morphemes that accurately represent the intended meaning and sequencing them in a syntactically acceptable manner. This must further be accompanied by matching corresponding phonetic speech sounds as well as facial and manual gestures to the morphosyntactic string and physically “articulating” the coordinated sequence (bottom left). Such mustering of linguistic resources and the underlying knowledge it represents is the focus of much cognitive research into L2 output. Taking only seconds in real time, the various social, cognitive, and linguistic variables involved in making L2 output entail many opportunities for instructional support, given an adequate understanding of the process.

Output From Audio-Lingualism to Communicative Language Teaching

The predominance of audio-lingualism in the mid-20th century meant that L2 instruction sought output that would reinforce linguistic habits via decontextualized production of L2 structural paradigms. These included dialogue recitations and grammar drills that, within Levelt’s terminology, offered little opportunity for learners to “conceptualize”

meaning themselves and link it to “formulation” and “articulatory” processes. The inadequacy of this approach became evident as learners often proved unable to apply mechanically drilled structures and dialogues to effective communication in other contexts. Furthermore, research on L2 English acquisition found that learners appeared to develop accuracy with particular forms in a common sequential order, regardless of their first language (L1) or the amount or type of instruction they received (e.g., Bailey, Madden, & Krashen, 1974). As a result, Stephen Krashen’s (1985) “Input Hypothesis,” and the “Natural Approach” to instruction that it inspired, proposed that instead of forcing mechanical output, instruction should simply provide meaningful, comprehensible L2 input, as when children learn their L1. Natural acquisition sequences would then run their course and meaningful output emerge when learners were ready. This thinking dovetailed with the nascent communicative language teaching (CLT) movement, which, drawing inspiration from linguistic anthropology and sociolinguistics, held that L2 output should reflect a broadly conceived communicative competence embracing both linguistic and sociocultural aspects of L2 speech communities.

Krashen’s idea that comprehensible input exclusively drives L2 development built on linguist Noam Chomsky’s belief that the mind is endowed with an innate “language acquisition device” uniquely specialized to process linguistic data and “encapsulated” from all other cognition, including the conscious, explicit knowledge of L2 structure that might derive from instruction and affect utterance planning, or conceptualization in Levelt’s model. Thus, although one might improve short-term accuracy by “monitoring” output, the underlying linguistic system used for formulation and articulation would remain unchanged. Consequently, cutting-edge instruction in the 1980s sought to subordinate L2 grammar as an organizing feature and elicit meaningful L2 output based on input models rather than linguistic explanations. Some CLT proponents proposed “task-based” syllabi built on “communicative functions” such as greetings, requests, descriptions, and narrations, and “notional categories” including time, sequence, quantity, and location (e.g., Wilkins, 1976). Within the Natural Approach and CLT, L2 output ideally followed extensive listening and required learners to adapt and personalize input models to facilitate linguistic development. Many advocated work in dyads or small groups (e.g., Long & Porter, 1985), and contemporaneous research justified such output practice as a means of either securing or providing comprehensible input via discourse modifications to clarify interlocutors’ meaning (e.g., Pica, Holliday, Lewis, & Morgenthaler, 1989). Indeed, Teresa Pica and her colleagues demonstrated that such “negotiation” was greatest during two-way information exchanges targeting specific communication goals, as opposed to collaborative decision making toward open-ended goals (Pica, Kanagy, & Falodun, 1993). These “jigsaw” or “information-gap” tasks are still considered essential tools for eliciting output in current L2 pedagogy.

Output and Attention to L2 Form

Challenges to the assumption that input alone drives L2 acquisition began appearing in the mid-1980s, as researchers following Krashen’s argument to its logical conclusion compared output from untutored, “naturalistic” L2 learners, who should have reached high levels of attainment after living among native speakers for years, to non-immersion classroom learners, who should not have developed as much after years of grammar-oriented instruction without such exposure. Consistently the findings demonstrated the opposite, however: Although exhibiting similar acquisitional sequences, naturalistic learners often plateaued at pidginized versions of their L2s, undersupplying required morphology while communicating basic meaning, whereas classroom learners more often reached higher

levels of complexity and accuracy, often oversupplying grammatical morphemes that had been instructional targets (e.g., Pica, 1983). This evidence that classrooms might facilitate L2 development better than naturalistic contexts through attention to L2 form soon led some to consider how output itself might also shape the process.

Merrill Swain (1985) formulated her “Output Hypothesis” after observing persistent grammatical errors among Canadian middle schoolers in L2 French immersion programs, where they had received years of input during instruction on many academic subjects, but little focus on French itself, and few requirements for spoken accuracy or elaboration. Swain reasoned that the L2 output missing from instruction must uniquely facilitate acquisition by “pushing” learners to syntactically process language beyond the semantically oriented comprehension of input (p. 249). Later, Swain (1995) proposed three specific functions of output in acquisition: (a) helping learners “notice the gap” between their intended meaning and their linguistic repertoire; (b) allowing “hypothesis testing” of L2 utterances; and (c) encouraging explicit, metalinguistic understanding of the L2 to guide utterance formulation. Building on Levelt and Swain, de Bot (1996) argued that L2 output aids acquisition by focusing attention within the conceptualizer on available support for formulation and articulation, and by “proceduralizing” coordination among the modules. Such support could include sources within or outside the learner, such as memory of grammatical rules, interlocutor assistance, or ambient L2 speech and texts. Thus, within Levelt’s terminology, the intentional act of carrying meaning from conceptualization to formulation and articulation was itself deemed an act of acquisition, and one often guided by explicit L2 knowledge.

Recent Cognitive and Sociocultural Proposals

Within CLT, proposals to better integrate the cognitive and social aspects of output emerged as views of its role in L2 acquisition evolved. One cognitively oriented strategy for directing attention to L2 form–meaning relationships involved carefully linking communicative functions and notions to target structures that would be “useful” or “essential” to a task (Loschky & Bley-Vroman, 1993). Such “focused tasks” might begin with “pre-task” warm-ups to prime necessary language and conclude with “post-task” follow-ups to provide feedback and utilize the exchanged information (Skehan, 1996). Such opportunities to use explicit knowledge for planning, monitoring, and editing L2 output were intended to engage the conceptualizer in improving the fluency, accuracy, and complexity of learner speech. Indeed, research on output modifications in response to prompts and feedback during focused tasks has demonstrated learning gains often exceeding those of exclusively comprehension-oriented practice (McDonough, 2005; Toth, 2006).

As sociocultural perspectives gained prominence in the 1990s, many theorists drew on CLT’s socio-anthropological roots, arguing that learner output be considered not only for how it might lead to greater accuracy vis-à-vis native-speaker norms, but also for how it may reflect participant goals, motivations, and discursive strategies. Many built on psychologist Lev Vygotsky’s view of language as a culturally mediated tool for thinking, and of collaboration as a catalyst for growth within one’s cognitive “zone of proximal development” (ZPD). Some documented how learners used L2 output for cooperative problem solving (Donato, 1994), while others focused on the relationship between output and learners’ sense of identity in L2 communities within and beyond the classroom, including immersion and Internet chat contexts (Duff, Wong, & Early, 2000; Darhower, 2006). Recent instructional proposals have likewise advocated L2 development via “*languageing*,” where learners explicitly talk through the application of grammatical rules to communicative tasks, in order to better “internalize” such culturally mediated concepts (Swain, 2006).

Meanwhile, a proposal for “dynamic assessment” of learners has combined the developmental potential of output with Vygotsky’s ZPD, recommending dialogic interaction during communicative tasks as a tool not only to determine a learner’s current proficiency, but also to create conditions for further communicative growth (Poehner, 2007).

Conclusion

Despite divergent emphases on internal versus external sources of development, both cognitive and sociocultural instructional proposals envision L2 learner output as purposeful communication supported by both learners’ explicit knowledge and interactions with others. Although the progression of ideas over recent decades reveals continued debate over the precise means by which L2 productive abilities develop, conceptualizing output holistically within Levelt’s model—as integrated processes of conceptualization, formulation, and articulation—means that instruction optimally facilitates L2 development not by isolating any one step, as in the mechanical practice of audio-lingualism, but rather by providing learners opportunities to plan, monitor, and edit productive language within meaning-making discourse. Indeed, after shifting from structure-driven audio-lingualism to the grammar-free Natural Approach, the developing consensus within CLT holds that instruction will be most facilitative if it brings explicit L2 knowledge, rich and developmentally appropriate input, and purposeful activity to bear on L2 self-expression, so that the complex act of coordinating language production may work in concert just as much in the classroom as it surely does beyond it.

Pacific Creoles

MIRIAM MEYERHOFF

A creole language emerges when speakers of mutually incomprehensible languages need to somehow bridge their communication gap. These lingua francas are commonly assumed to take shape first as a pidgin, which can be defined as a vehicular language used in a restricted set of social domains, typically characterized by speakers' (perhaps conscious) efforts at structural simplification. Often, linguists differentiate creoles from pidgins by whether or not there are at least some native speakers of the language—the existence of native speakers provides the context for the structural and social elaboration of a language that functionally and linguistically differentiates creoles from pidgins.

In the Pacific, the native speaker criterion for defining a language as a creole is less strictly adhered to. This is because some of the more widely spoken lingua francas of the region, such as Bislama (spoken in Vanuatu), achieve social and structural elaboration without necessarily acquiring a large proportion of native speakers. In much of Melanesia, continued multilingualism is quite common, though among the urban middle class this may be disappearing (Jourdan, 2008).

The Pacific is the largest body of water on Earth. It covers approximately one-third of the surface of the globe. People from more land-bound parts of the world often think of large bodies of water as separating peoples from each other. This is not necessarily true in the Pacific, where people often see themselves as being linked by the water. Long voyages and perhaps also contact between peoples have been part of the history of the Pacific since it was first settled by Austronesians moving out of their homeland in Taiwan around 5,500 years ago (Blust, 2009). The dispersal of Austronesian peoples was accompanied by extensive linguistic diversification. There are 900–1,200 Austronesian languages outside of Taiwan, and in the Oceanic subgroup alone there are approximately 450 languages (Blust, 2009).

Given this high degree of linguistic diversity and a propensity for contact facilitated by (rather than impeded by) the connecting ocean, we must assume that contact between speakers of mutually unintelligible languages has had a long history in the Pacific. Did this result in the formation of many pidgins and creoles? We do not know. Our records of the sociolinguistic situation in the Pacific before European contact (and in current environments outside the influence of the colonial languages) are limited (but see Williams, 2000). Most linguists working in the region would agree that widespread multilingualism may have been the norm (Crowley, 1990); certainly, the sociolinguistic context in which creole languages began to flourish was following European expansion in the Pacific from the 16th century onward.

Early contact between Europeans and Pacific Islanders often involved the negotiation of simplified forms of the indigenous languages. For example, Clark (1990) discusses pidgin forms of Māori attested in early European contact with New Zealand's native Polynesian communities, and similar reduced forms of Hawaiian used in the early period of the Hawaii plantations are recorded. Drechsel (1999) discusses evidence for a single maritime Polynesian pidgin that might have been used by sailors throughout the Pacific.

As European economic and colonial influence in the Pacific consolidated, there was a shift toward vehicular languages or lingua francas, in which the vocabulary draws primarily on European languages. This seems to reflect a clear change in the relative prestige and

2 PACIFIC CREOLES

power of the different ethnolinguistic groups in the Pacific. From this point we can talk of, for example, English-based or English-lexified creoles (*lexified* means the bulk of the lexicon/vocabulary is taken from English), which are more or less clearly influenced by substrate languages in a given region. (*Substrate* means the language(s) spoken as a language of the community; this tends to have a clear effect on the way the pidgin/creole is used, e.g., word order, the expression of thematic relations in the verb phrase, or semantic scope for a lexical item.) English-lexified creoles are the most numerous in the Pacific. In Vanuatu, Bislama is the national language; and in the Solomons and Papua New Guinea, Pijin and Tok Pisin are the de facto national lingua francas. Many people perceive these creoles as “bad English,” but they are better seen as examples of the English lexicon mapped (more or less) onto systematic substrate grammars. They are all, for example, characterized by argument deletion, serial verb constructions, pronoun systems that distinguish inclusive and exclusive plural, and transitive verb morphology.

From the 19th century, we find:

- Spanish-based creoles in the Philippines (Lipski, 1996). These are often known collectively as Chabacano (though this name is not favored by all speakers of the different dialects).
- Tayo, a French-based creole in New Caledonia (Ehrhart, 1993).
- Hiri Motu, a creole based on Motu with influence from English and other languages spoken in Papua New Guinea (Dutton & Brown, 1977).
- Many English-based creoles, such as Kriol in northern Australia (Harris, 1991; see also Shnukal, 1988); Tok Pisin in Papua New Guinea (Mühlhäusler, Dutton, & Romaine, 2003); Solomon Islands Pijin (Jourdan, 2007); Bislama in Vanuatu (Crowley, 1990; Meyerhoff, 2011); the language known locally as Pidgin (and by linguists as Hawaii Creole English) in Hawaii (Roberts, 1999); as well as some lesser-known varieties such as Ngatik Men’s Language (a Pohnapeian and English creole, Tryon & Charpentier, 2004, pp. 14–15). The southern hemisphere English creoles all trace back to a 19th-century lingua franca in eastern Australia (Baker, 1993).

This is not a comprehensive list of all the pidgin/creole languages that have been recorded in the Pacific. Reinecke (1975) and Meyerhoff (2008) provide other surveys of Pacific creoles.

The current vitality of the creoles in the Pacific differs considerably from place to place. Some are afforded national language status (e.g., Vanuatu, Papua New Guinea), but none are recognized as an official language of education, despite often being spoken by large proportions of the urban population (and sometimes being used informally by teachers in classroom interaction, e.g., Higgins 2010). Likewise, vernacular writing and creative expression in Pacific creoles differs by locality: in Hawaii, there are creative writing, theatre, and essays written in pidgin; in Vanuatu, some newspaper reporting, creative writing, and theatre are done in Bislama. For the most part, the Pacific creoles have withstood pressure from the standard lexifier or from other national and official languages because of their continued functionality as a medium of cross-linguistic communication, and also as expressions of local identity.

Paired and Group Oral Assessment

ALISTAIR VAN MOERE

The paired and group oral assessment formats involve candidates interacting together to perform a task while one or more examiners observe their performances and rate their language proficiency. Communicative language teaching led to the popularity of pair work and group work in the language classroom, and so too has pair and group work become more widespread in communicative approaches to assessment. The five examinations of the Cambridge Main Suite are particularly well known for incorporating paired tasks (Taylor, 2003). Examples of tasks utilized in these exams include candidates discussing color photographs, constructing a story together when each speaker knows half of it, or making a joint decision on an issue presented in the task material. The College English Test-Spoken English Test (CET-SET) in China is perhaps the most large-scale use of group tasks (He & Dai, 2006). Here, the task is for a group of three or four candidates to discuss a topic among themselves. Paired and group oral assessments are also used in schools and universities for placement testing, progress monitoring, and exit testing or matriculation, and are the subject of much validation research (e.g., Csépes, 2009; Ockey, 2009).

Testing candidates in groups can be advantageous in numerous ways: It is more practical than one-to-one interviews in terms of time and cost; it is less burdensome to examiners, who can focus on rating without also having to act as interlocutor; it is positively viewed by candidates and for some is less intimidating than interaction with an examiner; and it is linked closely to classroom practice, possibly providing a positive relation between teaching and testing. Group tests are appropriate for the assessment of various dimensions of oral proficiency, such as pronunciation, fluency, and grammatical and lexical range and accuracy. But the test format is particularly valued by language testers because it additionally allows examiners to observe candidates interacting together and demonstrating their communication strategies; strategies which may be suppressed or simply not elicited in traditional test formats such as the oral proficiency interview (Johnson, 2001).

Investigating the paired and group format, researchers have attempted to answer questions such as the following: How does the discourse in paired interaction differ from that of interviews or other oral tasks? What kind of conversational strategies and language functions are elicited? What effects do the participants have on each other's performance, especially when participants possess different proficiency levels, personality types, genders, acquaintanceships, task familiarity, or social skills? Do these variables affect discourse only, or do they also impact rating outcomes? Over the last 15 years or so these research questions have been studied using various methodologies, such as the analysis of discourse (particularly using conversation analysis [CA]), and the statistical analysis of ratings data (i.e., the scores assigned by the raters or examiners). The research has enabled language testers to characterize the discourse elicited in pair and group test tasks and to link discourse to the ratings that candidates receive (e.g., May, 2007). When testers know what kind of language and strategies candidates use in tests, they can make claims about which aspects of oral proficiency are assessed and represented in the test scores of these assessments. These themes are elaborated in the paragraphs that follow.

In interview tests, the interaction between candidate and examiner is asymmetric. Examiner-interlocutors guide the talk, decide who talks and when, control the topic and timing of the interaction, and ultimately skew the discourse so that it lacks the spontaneity

2 PAIRED AND GROUP ORAL ASSESSMENT

of normal conversation (Young, 1995). For example, it is common for an examiner to interrupt a candidate, but very rare for a candidate to interrupt an examiner. The advantage of paired tests, however, is that candidates have a more equal status. This means that the interaction is likely to be more conversation-like; participants have the same *rights* when it comes to initiating, ratifying topics, and taking and holding the floor, and the same *duties* for maintaining smooth interaction, developing the topic, and ensuring mutual comprehension (van Lier, 1989). Further, peer interaction among candidates seems to involve strategic processes which are likely to be practiced in natural, non-test conversation. Examples of these strategic processes include *negotiation of meaning* by means of clarifications, confirmations, and rephrasing, and *scaffolding* by providing contextual support (Ikeda, 1998). These communication strategies help the participants achieve better mutual understanding.

In addition to strategies associated with discourse management, test designers often would like to know whether the *functions* that they wish to assess are present in their tests. Interactional functions include activities such as comparing, describing, suggesting, and elaborating. This was demonstrated by French (2003), who applied a checklist of 30 expected functions to oral performances on the Cambridge Main Suite Examinations and observed 26 functions in the paired format, compared with 14 in the interview format.

However, the potential of paired and group oral formats for eliciting richer language samples and more varied interactions is not always fully achieved. For example, although peer interactants supposedly have equal status, this does not automatically introduce collaborative interactions. Sometimes participants may choose not to ratify their partner's topics, or may produce a series of monologues without actually extending one another's topics, or one speaker may be more dominant than the other (Van Moere, 2007, p. 342; Galaczi, 2008). Furthermore, peer interaction does not itself engender purposeful or functional talk. He and Dai (2006) examined group oral test performance in the CET-SET in China and found that less than a third of their 144 candidates produced any of the expected functions of *challenging*, *supporting*, *modifying*, *persuading*, and *developing*. Moreover, only a handful *negotiated meaning* in the discussion. Thus, peer test tasks must be properly framed in order to maximize the strategies or functions to be assessed; conversation that is not motivated by any clear pragmatic purpose may be unsuitable for second language (L2) assessment. Paired and group talk may be considered as valid not because of similarity to ordinary conversation, but because, if properly set up, it enables language testers to observe a wider variety of cognitive and strategic processes than might be gained from other oral assessment formats alone.

In terms of fairness, it is of concern that paired tests might expose candidates to interlocutors who may affect or portray them unfavorably. In interview tests, it is known that examiner-interlocutors can affect candidate performance by making the candidate appear either more or less proficient than they might otherwise seem (Brown, 2003) by, for example, adopting either a floor-supporting role or a harder line of questioning. Some of this variation can be controlled by means of examiner training and the use of an interlocutor frame, or a script that constrains the examiner in order to standardize test conditions (Taylor, 2003). But in group tests interlocutor variables are less easily controlled. Numerous interlocutor characteristics which might affect candidates' performance have been researched, including: gender (O'Loughlin, 2002), mismatch of proficiency level of interlocutor (Csépes, 2009), personality (Nakatsuhara, 2009; Ockey, 2009), first language (L1) and talkativeness (Young & Halleck, 1998), task familiarity (Plough & Gass, 1993), and acquaintanceship among interlocutors (Katona, 1998). The results of these investigations have been mixed. Findings appear to be context-dependent: Depending on the test, setting, rating procedure, candidate population, and even on individual differences among candidates within these paradigms, the characteristics of an interlocutor may or may not impact a candidate's performance and score outcome. This was exemplified by O'Sullivan (2000). In paired tests

involving Japanese subjects, O'Sullivan found that females accommodated male strangers, this being deleterious to their own performance but beneficial to the strangers. But a comparable experiment involving Turkish learners of English was diametrically at odds with the findings from Japan: Candidates performed better when their partner was male and exhibited significantly superior linguistic behavior and ratings when they were partnered with strangers.

Assuming that paired tests are desirable for their rich interactions, how should test designers account for the possible impact of interlocutor characteristics upon the test scores of their partner? Traditionally, interlocutor factors are considered as sources of *construct-irrelevant variance*, that is, sources of measurement error introduced into the assessment but which are not relevant to the ability that we wish to assess. Interlocutor factors are a threat to test reliability, standardization, and fairness. It is therefore incumbent upon test developers to be aware of, and preferably eliminate or reduce, the factors which might affect the performance of each individual test taker. This might be accomplished by: designing the test tasks so as to reduce unwanted effects; scheduling candidate groupings or pairings in advance, where possible, to ensure that candidates are not tested together if they might advantage or disadvantage one another unfairly; or by conducting research to show that perceived sources of unwanted variance do not negatively impact performance in the testing context.

Although paired and group tests are useful vehicles for the elicitation and assessment of interactional skills, these test formats and resulting test scores are not always used as the sole basis for decision making. For higher-stakes decision making in particular, group tasks are generally used as one element in an oral test that also consists of additional tasks.

Paltridge, Brian

WEI WANG

Brian Paltridge's contributions to applied linguistics research are in the area of genre analysis and its application in language teaching and learning, and research in the area of academic writing, especially thesis and dissertation writing. He has contributed to the field both as an innovative and influential scholar, and as an educator whose teaching and mentoring have made an important mark on his students and on the field.

Academic Background

Paltridge graduated with a BA in Language from Victoria University of Wellington in New Zealand, later receiving an Associate Diploma in Interpreting and Translation from the University of Western Sydney, the Royal Society of Arts Diploma in TEFLA, and a Graduate Diploma in TESOL from the University of Technology, Sydney. His MA in Applied Linguistics is from the University of Sydney. With a thesis named "Writing up Research: An Examination of the Current Concept of Genre," he obtained his PhD from the University of Waikato in New Zealand. His PhD was supervised by Winifred Crombie, Suzanne Eggins, David Butt, and Ruqaiya Hasan.

Academic Appointments

Starting his career as a teacher of adult ESL learners, he has taught in a wide range of educational institutions and organizations in Australia, New Zealand, and Italy. In 1992, he took up his first academic appointment as a senior lecturer in Applied Linguistics at the University of Waikato in New Zealand. In 1995, he joined the Department of Linguistics and Applied Linguistics at the University of Melbourne, where he contributed widely in both undergraduate and postgraduate teaching and further developed his interests in discourse analysis, genre studies, second language teaching and learning, and research methods in applied linguistics. His administrative responsibilities at the University of Melbourne included associate dean (academic programs) in the Faculty of Arts, chair of the Faculty of Arts Academic Programs Committee, and deputy head of the Department of Linguistics and Applied Linguistics.

In 2002, Paltridge joined the University of Sydney where he established a leading research program in the area of TESOL. As Professor of TESOL, he works broadly in teaching, research, and academic management at the University of Sydney. He has undertaken positions such as associate dean for Graduate Studies and for International Studies and is a member of various university and faculty committees. He is director of the TESOL Research Network and associate dean (Doctoral Studies) in his faculty. His teaching includes postgraduate courses in research methods, discourse analysis, and English for specific purposes. At the same time, supervision of MEd, MPhil, EdD, and PhD research students' theses and dissertations forms a major part of his work.

In 2007 he was a visiting professor to the Faculty of Education at the University of Hong Kong and in 2005/2006 a visiting professor to the Linguistic Institute for International Communication at Sophia University in Japan. In these two universities, he delivered lectures and conducted workshops on thesis supervision and academic writing.

Journal Articles and Book Chapters

Paltridge has published widely in the fields of applied linguistics and TESOL. His research articles appear in journals such as *ELT Journal*, the *Journal of Pragmatics*, *Applied Linguistics*, *World Englishes*, *System*, *Cross Currents*, *The Teacher Trainer*, *English Teaching Forum*, *English for Specific Purposes*, *EA Journal*, *Language Teaching*, the *Hong Kong Journal of Applied Linguistics*, *TESOL Matters*, *TESOL in Context*, *Iberica*, *Melbourne Papers in Applied Linguistics*, *IEEE Transactions on Professional Communication*, *The New Zealand Language Teacher*, *The TESOLANZ Journal*, *Prospect*, and the *University of Sydney Papers in TESOL*. He has also published book chapters with Cambridge University Press, Continuum, Erlbaum, TESOL, the University of Michigan Press, Springer, and Fitzroy Dearborn.

With Sue Starfield, he is editor of the journal *English for Specific Purposes*. He is also general editor of the *University of Sydney Papers in TESOL* and is a member of the editorial board for the *Journal of English for Academic Purposes*, the *Australian Review of Applied Linguistics* and the *English Australia Journal*.

Books

Paltridge has authored a number of influential books in applied linguistics, such as *Genre, Frames and Writing in Research Settings* (1997a), *Genre and the Language Learning Classroom* (2001), and *Discourse Analysis* (2006). An important work in genre studies, *Genre, Frames and Writing in Research Settings* aims to uncover what it is that enables language users to recognize a text as an instance of a particular genre. The framework it presents for the description of genre is drawn from frame semantics and work in discourse analysis, pragmatics, rhetoric, language and cognition, natural language processing, artificial intelligence, and critical theory. As an introductory book for researchers and postgraduate students who are new to the field of discourse analysis, *Discourse Analysis* covers key issues in the area of discourse analysis and gives a thorough account of each of them. A key theme throughout this book is the notion of language as social practice; that is, what the use of spoken and written discourse tells us about people's social worlds.

With Sue Starfield, he authored *Thesis and Dissertation Writing in a Second Language* (2007). This is a timely and welcome handbook for supervisors working with students from a language and culture background other than English. Paltridge and Starfield unpack tacit understandings that supervisors often have of the thesis and dissertation writing process that are often not shared by their students.

With his TESOL colleagues at the University of Sydney, he wrote *Teaching Academic Writing* (Paltridge et al., 2009). He edited, with Aek Phakiti, a volume titled the *Continuum Companion to Research Methods in Applied Linguistics* (2010). With Diane Belcher and Ann Johns, he edited *New Directions for ESP Research* (2011) and with Ken Hyland the *Continuum Companion to Discourse Analysis* (2011).

Research Contributions

Throughout his academic career, Paltridge has engaged in many research projects, especially in the areas of genre studies and academic discourse. He is currently involved in an Australian Research Council funded project with Sue Starfield and Louise Ravelli titled "Writing in the Academy: The Practice-Based Thesis as an Evolving Genre." This project aims to examine the particular nature and character of practice-based doctoral theses and, via this examination, to make both practical and theoretical contributions to the field of research, higher degree supervision, and training and advanced academic literacies research.

Other important research projects that he has worked on include “Academic Literacies and Changing University Communities” (Paltridge, 2002a) in which he examines the changing nature of academic communities and what this means for students writing in English. In “The Exegesis as a Genre: An Ethnographic Examination” (Paltridge, 2004a) he explores the context of production and interpretation of exegeses in the area of art and design as an instance of the thesis genre and what this means for students writing these texts. “Thesis and Dissertation Writing: An Examination of Published Advice and Actual Practice” (Paltridge, 2002b) is an examination of the extent to which advice given in published handbooks on the rhetorical structuring of theses and dissertations concurs with what happens in actual practice.

A further important contribution is in his drawing together of different perspectives on genre analysis. From his early academic research (e.g., Paltridge, 1995, 1997a) he has focused on theoretical considerations in relation to the notion of genre. His John Benjamins book (1997a) explores the significance of interactional and cognitive/conceptual frames in the writing of scientific discourse. With an aim to broaden approaches to genre analysis, Paltridge has drawn on ethnographic research techniques and, especially, the notion of textographies (Swales, 1998) to examine academic writing, considering how an ethnography of writing can add an understanding of the production, and interpretation of written academic texts (see, e.g., Paltridge, 2004a, 2008).

Paltridge’s (1996) article “Genre, Text Type and the Language Learning Classroom” represents another important contribution to the area of genre studies. This article discusses the notions of genre and text type within the context of language learning classrooms. The distinction between genre and text type, he argues, is an important and useful one for language teaching and learning. Further applications of genre in language learning classrooms are illustrated in his book *Genre and the Language Learning Classroom* (Paltridge, 2001). While acknowledging that a range of theoretical perspectives on genre exists, this book shows that this diversity is a powerful and useful resource for teaching genres, and it illustrates how genre can serve as an organizing principle for language-learning programs. It also examines how various aspects of genre knowledge—such as context, discourse, and language—can be explored in language-learning classrooms.

A further important contribution is in his work on thesis and dissertation writing and the teaching of academic writing more generally (e.g., Paltridge, 1997b, 2002b, 2004b, 2008; Paltridge & Starfield, 2007; Paltridge et al., 2009). His major concerns in this area are how to prepare ESL students for research writing, the complex challenges that ESL students face in an English medium education, and how supervisors could help students respond to these challenges. His state-of-the-art article in *Language Teaching* (Paltridge, 2004b) reviews research and developments that are relevant to second language students writing in academic settings. With over 300 references, this article presents a wide view of developments in research and teaching practices in academic writing.

His most recent books with colleagues (Paltridge & Starfield, 2007; Paltridge et al., 2009) reflect his rich experience in the teaching and research of academic writing, especially in working with students from linguistically diverse cultural backgrounds. *Teaching Academic Writing* (Paltridge et al., 2009) combines research and practice to explore questions such as how academic writing varies between educational settings, disciplines, and cultures and how different approaches to knowledge affect academic writing. This book provides both an accessible and detailed survey of issues that shape the teaching of writing to ESL students in academic institutions. This includes the context and process of academic writing, needs analysis, teaching approaches, the interrelationship between writing and vocabulary, intercultural perspectives, feedback, and assessment. This book also includes suggestions for practical resources that can be used in academic writing classrooms.

Paltridge's research students have carried out work in a wide range of areas. This includes research in the area of discourse analysis, genre analysis, English for specific purposes, language and identity, and cross-cultural pragmatics. In each of these projects he encourages his students to go "beyond the text" in order to explore not just what people "do" with language, but also why they do what they do.

Participation Frameworks and Production Formats in the Analysis of Discourse and Interaction

CAROL C. THOMPSON

Introduction

When people talk they do so in organized ways. Even conversations that appear spontaneous exhibit patterns (both speech and physical patterns) in which speakers and hearers arrange themselves. For example, in discussions about the weather we may quote a forecast to a friend who is planning to travel; a bystander not originally part of the conversation may feel free to step in and produce a competing forecast. In classrooms teachers often use the initiation/response/evaluation (IRE) format for conducting conversations; students quickly learn that they must answer only the question under discussion and not change the subject. On the other hand participants in online discussion forums or other social media may broadcast messages to the group without expecting replies from anyone in particular. For example, one may ask if one's peers have a recipe and hope that someone will respond; responders may contribute, ignore, or change the subject. Although these situations may appear unrelated, the intentions of speakers and the way in which hearers receive their speech follow certain predictable patterns. Erving Goffman's concept of *production formats* can help us to understand the roles that speakers assume in interaction, and his concept of *participation frameworks* can help us to understand the positions participants take relative to one another.

Rather than seeing discourse as simple turn taking or as a transaction of information, Goffman and several linguistic anthropologists who have built on his work view discourse as an emergent process. Some researchers have examined gestures and other embodied signals that participants use in addition to the speech itself. Others have investigated the influence of settings and cultural expectations on participant engagement in various kinds of conversations. Still others have looked at disembodied and often asynchronous communicative participation in screen-based social networks. These studies have often examined how the social identities of participants both guide communicative encounters and are developed within them. Understanding production formats and participant frameworks helps researchers to understand the roles and identities that participants adopt.

Production Formats

Goffman theorized that understanding talk as a social practice requires a deep analysis of how speakers and hearers structure their participation. The roles that participants play, and the positions they take with respect to these roles, are described as *production formats* and *participant frameworks*. Speakers enact their participation within a production format through the roles of *principal*, *author*, and *animator*. The principal is the person ultimately responsible for and committed to the talk; the author constructs the speech itself, and the animator is the voice box. To understand the distinction, it is helpful to use Goodwin and

Goodwin's (2004) example in which the principal is the head of state, the author is his speechwriter, and the animator is the press secretary who actually delivers the speech. These three roles are often separate in such institutional interactions. They are habitually enacted in ways that are circumscribed: the press secretary does not add his personal views of the speech or policy of the head of state. In this example the roles are distinct and visible; however, institutionalized practices can also act to obscure one or more roles. Scollon (2004), for example, has noted that in many television commercials, characters speak on behalf of a product without the sponsor appearing to participate.

In other situations there may be considerable fluidity in roles, and speakers may take on more than one role in a production format. These changes are often indicated by code switching, in which speakers vary their tone of voice or bodily gestures to indicate alignment (or lack of it) with the words they are saying. Code switching allows speakers to change roles within a single encounter such as a meeting by "changing hats" (Goffman, 1981, p. 145); speakers may shift from the role of animator to author and principal using embodied and speech cues to signal their new social role to hearers. Performers can use this role fluidity to comic advantage: the television comedian Jon Stewart is an excellent example of a performer who makes the shift from voice box to principal to author quickly, often within a single phrase; it is the shift within the production format that audiences find humorous.

These institutional examples are somewhat different from the more casual conversations in which we usually assume that an "individual who animates is formulating his own text and staking out his own position through it: animator, author, and principal are one" (Goffman, 1981, p. 145). This can be an erroneous assumption, however, as Goffman points out. In apparently extemporaneous "fresh talk" (p. 146), we may in fact use the positions and words of others. And when we quote conversations of others we embed several layers of speech in an encounter; production formats can thus become quite complex amalgams of speaker roles.

Participation Frameworks

Goffman's notion of the participation framework is a way of understanding the positions participants take toward their own talk. Hearers in encounters can play a variety of roles in the same way that speakers do. Hearers or audiences may, for example, be directly addressed "official participant[s]" (Goffman, 1981, p. 131) who are "ratified," or they may be "bystanders" and thus "unratified"; their status can be discerned through the visual cues of the speaker, who may address them directly if they are ratified or ignore them if they are not. Speakers adjust both the content of what they say and the form of their talk in accordance with the perceived needs of their addressees, but they also adjust to the presence of bystanders; they may edit what they say, or they may pretend to talk to a ratified participant but intend their words for a bystander.

Hearers may adopt a number of postures toward the conversation. They may listen intently, even if unratified. If there are several hearers, they may ignore the speaker and engage in conversation that is not a part of the main encounter (by-play), thus changing their participation. Such conversations may act as a Greek chorus, commenting on the main conversation. Goffman called the positions that participants take up with regard to utterances *participation statuses*; and he called the statuses of all present participants at a given time the *participation framework*. (Though participant frameworks are commonly understood to apply to all participants, Kress and van Leeuwen, 2001, and Levinson, 1988, apply the concept only to hearers.)

Taken together, participation frameworks and the production formats powerfully reveal the large and small changes in *footing* (our relation to ourselves and others in a conversation). These changes are usually manifested in the way we produce or receive an utterance. Goffman's system of examining conversational structure has been central to understanding participant roles in conversations, and researchers have continued to build upon these insights.

Goodwin and Goodwin

Goffman's concepts of *participation framework* and *production format* have been expanded upon by a number of other linguistic anthropologists. Goodwin and Goodwin (2004), for example, have noted the absence in Goffman's writing of a methodology for understanding the "dynamic" ways in which speakers and hearers account for and build upon each other's words. Nor, they argue, is there a framework for understanding the role of hearer, who is positioned as an interactive foil for the speaker but is not truly a participant in the conversation. Participation must be understood as emergent, as activity, and as embodied. For example, they consider how one participant, unable to use speech effectively because of a stroke, instead used voice, tone, and bodily gesture to participate actively in a family activity, responding to and assessing the objects of conversation.

Goodwin and Goodwin further argue that participation frameworks must account for the ways in which speakers and hearers attend to both the activity in which they are engaged and to each other. Hearers who can participate with cognitive depth will be able to figure out both what is happening within the conversation and how they should contribute. Goodwin and Goodwin thus link this kind of participation framework both to the activity of the ongoing conversation itself and to activity outside it.

Conversation Within Activity

Linguistic anthropologists have used insights about participant structures in conversation to examine conversation in work situations. If a conversation emerges within activity, then clearly certain activities will enable or constrain what speakers can say and how hearers are likely to receive utterances. For example, participants in courtroom trials, in classrooms, or in job interviews are expected to perform in socially sanctioned ways. The social sanctions, however, may vary remarkably across communities of practice, even when an essential activity such as writing for an audience is held constant. For example, Scollon (2004) has found that production formats will vary significantly across advertising, journalism, and academic writing, with participants adopting quite different stances with regard to the texts that they use and their audiences. This is because each community of practice is signaling a different position with regard to its audience. Academic discourse is a marker of membership in a larger community of scholarly practice; journalists signal their outsider status; and advertisers engineer encounters between their clients (principals) and their audiences without seeming to engage in their roles as animators.

Work situations in which participants address each other directly may or may not offer opportunities for fluidity in participation frameworks. In one youth organization in which youth were designing a Web site together they used the words of their adult mentor and boss Jon, even as he sat next to them in the room. (The principal, the client for the Web site, was absent; Thompson & Bouillion, in press).

4 PARTICIPATION FRAMEWORKS AND PRODUCTION FORMATS

MARIA: I like the colors but I think that they're, if you change them up, like where they're at and stuff, it'll be good, and I think that the red is—
RAQUEL: —I have to fix it—
MARIA: —and there's too much space.
RAQUEL: I gotta move the [image of the] books over. I was axing Jon if I should [unintelligible] and he said maybe you should, maybe you should, and that's not an answer
JON: ooohhhh—
ALL: hahahaha
AJUA: he says you have to think on your own
RAQUEL: ok I'll fix 'em

In this conversation the youth reanimate the words of their boss twice, adding a comment that his guidance wasn't helpful. Jon's "ooohhh" and the laughter that follows indicates the ways that the youth habitually reanimate the words of the adults in the organization as reference points but also feel free to contribute their own unscripted responses.

Although this workspace is quite informal, others have quite different structures; the relative status of participants usually guides production formats and participant frameworks in work environments. For example, as Drew and Heritage (1992) indicate, institutional settings such as schools and doctors' offices often have characteristic IRE production formats. These formats help reveal how settings are structured. One needs to look at who speaks, when, with what kinds of lexical terminology, and how this is affected by the professional status of participants. IRE formats are also powerful structures in many job interviews (Button, 1992). Button describes how candidates for a senior teaching position misunderstood the speaker's interview questions, thus leaving the interviewer an opportunity to build cases against them. However, candidates, or any recipients for that matter, are themselves assessing the evaluation of their answers, and they may revise and clarify previous answers, thus changing their own footing toward their previous statements.

Gumperz (1992) also examined the difficulties in speaker/hearer interactions in data from a job-training program in Britain, where applicants were asked a series of questions in order to determine whether they were appropriate candidates. He describes the "context-bound, interactive processes through which certain individuals are stereotyped as members of stigmatized minorities" (p. 302). By looking at turn taking, sequential organization, and conversational negotiation, Gumperz was able to trace the ways in which participants are able to make inferences about their talk and collaboratively continue to produce it. An interview with a bricklayer, for example, became a collaborative effort between the interviewer and interviewee when the interviewer actually began to supply some answers on the bricklayer's behalf. In this participation framework, speakers actually author and animate the speech that they as principals wish to hear, and then take up a position toward it. However, knowing how to reconfigure one's role in a participation framework requires experience and training that young people may not have, especially if they are outsiders to the community that offers jobs. Social inequality coupled with age differences can make searching for openings in conversations very difficult for youth who may not understand the expectations of speakers. For urban youth, for example, it also requires that they understand how they are likely to be perceived by their interlocutors. They are frequently positioned as deserving poor, inept, pitiable, or frightening—and thus unworthy candidates (Thompson, 2011).

Social Networking

One further application of Goffman's participation framework and production format is in screen-based social media. Kress and van Leeuwen (2001) have used and expanded

upon Goffman's notions of participation frameworks and production formats, roughly aligning their "'discourse,' 'design,' and 'production,'" (p. 86) with his production format. They argue that animators/producers are implicated in the construction of meaning because they necessarily interpret scripts or recipes by tone of voice and characteristic speech phrasing. For example, newsreaders may use particular vocabularies and tones of voice as a signal of impartiality.

Building on Goffman's notion that animators may also become "loudspeakers," they add the notion of transmitter/distributor to the production format. By participating in distribution they use technology to both reproduce and change one prior semiotic form into another. These new semiotic forms create the opportunity for new production formats. They also open up the possibilities for participation frameworks, which were not available with older technological tools. Web site producers, for example, can prescribe and narrow the choices that recipients can exercise, but other social media such as discussion forums and Facebook can expand the interactional possibilities for speakers and hearers. Facebook users can appeal simultaneously to all of their friends for information, advertise a forthcoming book or performance, alert friends to their position, exchange photographs and other multimedia artifacts, and animate the material of others. Some friends/recipients will often be bystanders to conversations; others habitually respond, but they are disembodied, and until they assume the role of speaker are less visible and therefore somewhat less subject to analysis. The use of *like* as a response, with its monotonal indication of unspecified interest, agreement, or acknowledgment, narrows the role of recipient. On the other hand, the distribution networks substantially increase both the kinds of production and their reach.

Discussion forums have a somewhat more limited reach as they are centered on shared interests, but they, too, allow both speakers and hearers to play multiple roles. On one such academic forum with hundreds of threads, participants can choose to ask for advice (how to effectively prepare for an interview for a position or how to address home repairs), use the forum as an opportunity to express displeasure with something occurring outside the forum, bring books to the attention of peers, or discuss technology use. Some participants with thousands of posts have alternated between the roles of principal, author, and animator, passing on knowledge gained elsewhere, authoring their own posts, or acting as principals. Within the back-and-forth of the forums, participants often exchange roles and take up new positions toward beliefs they have previously espoused. In these technologically constructed interactions, distribution becomes a significant factor that contributes to their dynamism.

Pattern Grammar

SUSAN HUNSTON

Introduction

Pattern grammar is based on corpus investigation, which encourages the observation of items that regularly occur together. When those items are identified on purely formal grounds (that is, relating to form only, not to meaning or function), they are described as the elements of a pattern. This leads to a sentence analysis that picks out the relevant formal elements and links lexis and grammar. For example, the invented sentence “*It is important to remember that resistance to some diseases is hereditary*” might be analyzed as follows:

- *important* is followed by a to-infinitive clause and preceded by a “dummy” subject *it* with a link verb such as *BE* or *BECOME*;
- *remember* is followed by a *that*-clause;
- *resistance* is followed by the preposition *to* and a noun phrase.

In each case, the word involved (*important*, *remember*, *resistance*) is important to the pattern; only a selection of words in English are followed by to-infinitive clauses or that-clauses or by the preposition *to*. For example, in current British English, *important* could be replaced by *possible* or *difficult* or *gratifying* or *remarkable* but not by, say, *likely* or *suggested*.

This entry describes the origins of the concept of pattern grammar, followed by an account of pattern grammar in some detail. The applications of the grammar are then discussed, and its relations to similar ideas are considered.

Origins

In practical terms the origins of what is now known as “pattern grammar” lie in advice given to language learners, for example by Hornby (1954) and more recently in the *Collins COBUILD English Dictionary* (1995), as described below. The theoretical basis for the concept is outlined by Stubbs (1996, pp. 22–50), who traces a distinct tradition of linguistics from Firth (e.g., 1957) to Halliday and, more particularly, Sinclair (e.g., 1991). This tradition rejects a sharp distinction between “meaning” and “form” (a distinction which would suggest that choosing a meaning might be a separate activity from choosing a language form) and equally questions the distinction between “lexis” and “grammar” (a distinction which implies that the grammar of a language exists as a system that is independent of the words of that language). Instead, Sinclair (1991) suggests that language is made up of semifixed phrases, or “units of meaning,” each consisting of a mixture of what are usually seen as lexical and grammatical items, and each unambiguous in terms of meaning. He notes that these phrases are most easily observed by looking at large quantities of naturally occurring discourse. Corpus study corroborated his view that the unit of meaning in discourse was not the individual word but the sequence or phrase. He therefore saw it as crucial that dictionary entries described these extended units rather than words in isolation.

One aspect of the unit of meaning is “colligation:” the co-occurrence of the target word with grammatical features. In particular, a word might be observed to co-occur with a particular kind of clause or with one or more specific prepositions. An example cited by Francis (1994) is the verb *RESOLVE*. A reasonably comprehensive corpus of English will show examples such as these: first, “a person resolves a situation” or “a problem is resolved;” second, “a person resolves to take a course of action”; and finally, “a mixture resolves into its component parts” or “something resolves a mixture into its component parts.” There is a clear meaning distinction between each of these three. The co-occurrence or colligation of *RESOLVE* with a noun phrase, with a to-infinitive clause, or with the preposition *into*, is part of the units of meaning that may be identified with *RESOLVE* as the node. In terms of the practical aspects of writing a dictionary, it is feasible to focus on these co-occurrences alone and in doing so to describe the “grammar” of each word or word-sense. For example, *RESOLVE* may be described as occurring with a noun phrase, or in the passive, with the meaning of “solving a problem,” as occurring with a to-infinitive clause with the meaning of “take a decision,” and as occurring with *into* with the meaning of “divide into parts.”

It is true that describing the grammar of the word in this way somewhat diminishes Sinclair’s view of the integrity of the unit of meaning. This view of pattern isolates the connection between the lexis, the node word, and the grammar, the co-occurring phrase or clause. Sinclair’s unit of meaning is more holistic than this suggests, and cannot be reduced to lexis + grammar. Francis (1993, 1994) clearly relates the pattern to the more comprehensive unit by discussing not only the formal features of the pattern but also the semantic restrictions on the component parts. On the other hand, a dictionary needs to meet some expectations, and describing the grammar of each word-sense is a way of incorporating some of the insights relating to units of meaning while maintaining the familiar information that a user expects to encounter in a dictionary.

The COBUILD Publications

The practicalities of dictionary design pose a problem for representing patterns. The representation needs to be transparent to learners, avoiding technical terminology where possible. It needs to be flexible, so that detail that might be important to only one sense of one word can be captured, as well as the more generalizable patterns. In addition, as space is at a premium in a printed dictionary, the representation needs to take up very little physical space. To meet these criteria, Francis and her colleagues devised a pattern of representation that showed the sequence of pattern elements in a sequence of abbreviated notations. For example, the sequence “something resolves a mixture into its component parts” is reduced to “noun-phrase verb noun-phrase into noun-phrase.” This is further reduced to “n v n into n.” Because on the whole all verbs are preceded by a noun phrase, and so this information is redundant, the first noun phrase of the pattern is omitted from the representation, leaving “v n into n.” A further refinement is to put the element standing for the word under investigation, *RESOLVE* in this case, in capitals, and to italicize any elements that represent an actual word (a “type” in corpus linguistics terminology) rather than a class or phrase: the word *into* in this case. The final version of the pattern, then, is “V n *into* n.” It is worth remembering at this point what is missing from this notation. It tells us only that *RESOLVE* is associated with *into*; it does not tell us that the noun phrase following *RESOLVE* indicates a mixture of things, or that the noun phrase following *into* indicates the components of that mixture. In short, the pattern notation captures only a small part of the information present in the unit of meaning, and that information is what might be called the grammar of the word.

In the COBUILD dictionary of 1995, every word is annotated in terms of the patterns it is associated with. The result is consistent, if sometimes rather dull. For example, the word *them* is annotated with the patterns “v PRON” (the pronoun follows a verb, as in *tell them*) and “prep PRON” (the pronoun follows a preposition, as in *listen to them*). Patterns associated with verbs, nouns, and adjectives are more interesting. Some patterns contain several elements. The verb *TRANSFORM*, for example, is annotated with the pattern “V n from n into n,” as in *she / had transformed / him / from / a hard-drinking womanizer / into / a devoted husband and father*. An adjective such as *difficult* occurs in the pattern “it v-link ADJ for n to-inf,” as in *it / was / difficult / for / her / to forgive him* (though this annotation is not in the dictionary). These verb, noun, and adjective patterns are also probably the most useful for learners of English. For example, someone wishing to express the ideas of “complete the project” and “not likely” may find it helpful to know that *unlikely* occurs with the pattern “ADJ to-inf,” as in *I am unlikely to complete the project* and with the pattern “it v-link ADJ that,” as in *it is unlikely that I will complete the project*, but not with the pattern “it v-link ADJ to-inf,” as in **it is unlikely to complete the project* (where *it* is a dummy subject and does not refer to a previously-named object).

It is not surprising, then, that the two further reference books published under the COBUILD imprint and focusing on patterns highlighted verbs (Francis, Hunston, & Manning, 1996) and nouns and adjectives (Francis et al., 1998). These books basically list all or most of the words to be found with each given pattern, as far as can be done given that language is constantly changing. They also expand the repertoire of recorded patterns somewhat (including, for example, the additional pattern found with *difficult*, noted above, that is not in the dictionary). In Francis et al. (1996), each pattern is further annotated with one or more structural analyses. For example, the pattern “V n” (verb followed by noun phrase) is described as having three distinct structural analyses: verb and complement (as in *He was my friend*), verb and object (as in *The thieves broke a window*), and verb and adjunct (as *Children don’t talk that way*). The pattern “V n n” is also described as having three structures: verb with two objects (as *He gave her a present*), verb with object and object complement (as in *They appointed him chairman*), and verb with object and adjunct (as in *They won the game 4–2*). Whereas some of these analyses are standard traditional ones, others are less so. The terms “direct object” and “indirect object” are avoided, for example, and both objects in *He gave her a present* are labelled simply “object.” In patterns with prepositions, terms such as “prepositional object” are used to describe relationships that are analogous with a traditional object, but with a preposition, as in *The tax people are inquiring into his affairs*, where the phrase *into his affairs* is analyzed as a prepositional object. Francis (1993), however, takes an energetic stand against structural analysis, arguing that it fails to recognize lexical restrictions and that whereas most patterns can be expressed in structural terms, many cannot. Hunston and Francis (1999) also express dissatisfaction with the structural analyses and suggest that patterns should be allowed to stand by themselves. As a result, the patterns of nouns and adjectives in Francis et al. (1998) have no such analyses. This has led to criticism, for example by Teubert (2007), who argues that much useful information distinguishing between formally similar but functionally different examples is thereby lost.

The main feature of Francis et al. (1996) and Francis et al. (1998) is the listing of verbs, nouns, and adjectives that are found with each pattern, with those lists divided into broadly defined “meaning groups.” An individual word may occur in a number of different lists, in each case with a different pattern and/or with a different set of similar words. For example, the noun *struggle* occurs with the patterns “N among pl-n,” “N between pl-n,” “N over n” and “N with n”; in these patterns it indicates a fight, dispute or contest and is placed along with words such as *competition, conflict, dispute, fight/fighting, quarrel*, and

rivalry. *Struggle* also occurs with the pattern “N to-inf”; in this pattern it indicates an attempt to do something and is placed alongside words such as *attempt*, *battle*, *bid*, *campaign*, *mission*, and *rush*. Another pattern it occurs with is “it v-link det N to-inf” (as in *it was a struggle to . . .*), and here it is placed alongside other indications of difficulty, such as *battle*, *challenge*, *effort*, *nightmare*, *problem*, and *task*. It can be argued that each pattern makes salient a different aspect of the concept of “struggle:” conflict, attempt, and difficulty respectively.

In a sense, these collections of word-pattern combinations are similar to a thesaurus, because isolating a pattern will bring together groups of words with semantic similarities. For example, verbs occurring with the pattern “V into n” are divided into thirteen groups in Francis et al. (1996). One consists of a set of verbs indicating “breaking or dividing:” *break*, *crumble*, *divide*, *fragment*, *polarize*, *resolve*, *separate*, *shatter*, *smash*, *splinter*, and *split*; another is a set indicating “collisions:” *bang*, *barge*, *bump*, *cannon*, *crash*, *plough*, *run*, *slam*, and *smash*; and another group indicates “exerting pressure or making a dent or hole:” *bite*, *bore*, *crunch*, *dig*, *drill*, *eat*, and *sink*. There is an intuitive convenience here, but also some problems even at the level of practicality. The words associated with most patterns fall into a large number of meaning groups, some of which are very small. The pattern “N for n,” for example, is divided in Francis et al. (1998) into 31 groups, of which 24 contain fewer than 10 nouns and 15 contain 5 nouns or fewer. Even where the grouping is more successful, listing words in this way implies that the words themselves have independent meaning, rather than that the words are the centers of units of meaning. For example, *bite into*, *eat into*, and *sink into* will each occur in very different meaning units, in spite of their apparent similarity.

Francis et al. (1996, 1998) depend on a perceived relationship between pattern and meaning, although the nature of this relationship is left inexplicit. Hunston (2008) suggests that patterns, and in particular prepositions, act as classifiers, prioritizing one aspect of an entity or activity by aligning it with other entities or activities that occur with the same preposition. This argument was used in the discussion of *struggle* above. A more extreme example is the verb *BREAK*. *BREAK into (pieces)* highlights a particular feature of the “breaking” action, whereas *BREAK with (an organization)* aligns the action with other forms of interpersonal interaction such as *finish*, *quarrel*, or *battle*. Using *BREAK* in the pattern “V n to n,” as in *broke the news to his family*, aligns the verb with verbs of communication such as *TELL*.

Applications of Pattern Grammar

Pattern grammar is essentially an application of corpus observation. It began as a tool for lexicographers, giving them a simple way of noting how a word is used for the benefit of learners of English. The other main application of pattern grammar is in language teaching, especially the teaching of English. It lends itself to a view of teaching grammar that focuses on “consciousness-raising” rather than explicit instruction (e.g., Willis, 2003). In other words, it is not envisaged that a teacher would give learners information about each pattern in turn, as is often done with verb tenses, for example; instead learners would be encouraged to notice which words occur with which patterns and so build up a repertoire of, on the one hand, correct usage, and on the other hand, ways of saying things. Willis (2003) has suggested that patterns comprise a grammar of class, which exists alongside orientation (or deixis) and structure as those aspects of English that make up its pedagogic grammar. The grammar of class treats the words occurring with a given pattern as constituting a “class” of words; learners becoming familiar with an item of vocabulary will learn which class the item belongs to, or how it is correctly used.

Patterns can play a part also in the corpus-based analysis of discourse, drawing on the range of meanings associated with patterns. Charles (2003, 2006a, 2006b), for example, uses patterns associated with stance, notably those involving that-clauses (including that-clauses following specific nouns and verbs), to draw comparisons between writing in materials science and political science. The patterns, among other features, act as a search mechanism to highlight similarities and differences between the disciplines.

An application of pattern grammar that is still in its infancy is the development of local grammars to find information in large amounts of text. In the *RESOLVE* example above, for example, it is possible to specify that if the verb *RESOLVE* is found followed by a to-infinitive form, the noun phrase preceding the verb will indicate the person taking the decision while the decision itself will appear in the to-infinitive clause. The result is a very partial “local grammar” of reporting decision making. Of the local grammars based on patterns, perhaps the most useful to date is the local grammar of affect in Bednarek (2008, pp. 65–99), which utilizes patterns to give lexical specificity to the concept of affect discussed by Martin and White (2005).

Pattern Grammar and Related Concepts

Pattern grammar belongs to a corpus-based tradition that includes work on units of meaning (Sinclair 1991, 2004), semantic prosody (Louw, 1993), and lexical priming (Hoey, 2004). It is not, however, unique in taking an approach to grammar that prioritizes pattern over system. For example, it has a great deal in common with approaches such as construction grammar (e.g., Goldberg, 2006) and collocations (e.g., Stefanowitsch and Gries, 2003). Among other similarities between pattern and construction grammar (see Hunston, 2008) is the focus on the detail of word and pattern or construction co-occurrence and the link between the pattern or construction and meaning. However, patterns constitute only a subset of constructions, as construction grammar includes forms which are not lexically restricted, such as question forms, in its remit. Those researchers working with collocations also assume an integration of lexis and grammar and propose statistically validated associations between constructions (including, but not restricted to, those suggested as patterns) and words. They are therefore in a position to add rich lexical detail to a pattern-based description and to flesh out the bones of pattern grammar.

Paulston, Christina Bratt

G. RICHARD TUCKER

Christina Bratt Paulston has been a prolific contributor to the applied linguistics literature for more than 40 years with contributions ranging from her early work on teaching English as an additional language (e.g., Paulston & Bruder, 1975) to her subsequent work in the general area of sociolinguistics with a special focus on diverse aspects of language education policy and planning (e.g., Paulston, 1988, 1992, 1994, 2003; Kiesling & Paulston, 2004).

Paulston was born in Stockholm, Sweden in 1932 where she grew up and completed her primary and secondary education. After graduation from the *gymnasium*, she relocated to Minnesota where she attended Carleton College (BA, English Literature, 1953), followed by the University of Minnesota (MA, English and Comparative Literature, 1955). She then taught for a number of years in high schools in Minnesota, Morocco, and Sweden, before enrolling in the doctoral program in Applied Linguistics at Teachers College Columbia University from which she received her doctorate in 1966.

After working overseas once again, in India and in Peru, Paulston accepted a position in the Department of (then General) Linguistics at the University of Pittsburgh where she began her distinguished career in 1969. She also served as Director of the English Language Institute (ELI) (1969–98) and as Chair of the Department (1975–89).

Her early professional contributions to the development of materials and methods texts for the teaching of English as an additional language were shaped by her personal bilingual experiences as well as by her international teaching assignments. Through her scholarship and strong leadership, the ELI at the University of Pittsburgh became one of the strongest centers in the United States for preparing international students to enter English-medium university classes. During the 1970s, Paulston authored or co-authored some of the decade's most popular articles and texts designed for diverse learner and teacher audiences at home and abroad (e.g., Paulston, 1974, 1982; Paulston & Bruder, 1975). She also served as a frequent presenter at local, regional, national, and international conferences where she actively shared ideas, conducted in-service workshops, and influenced the emerging international TESOL (Teachers of English to Speakers of Other Languages) organization and movement.

During the latter part of the 1970s and throughout the 1980s, Paulston became increasingly interested in issues related to the “rights” of individuals who were studying, working, or living in settings where their own first language was not the dominant or official language (e.g., Paulston, 1988; Paulston & Peckham, 1998). She published broadly on the topic and also lectured extensively at universities or in other forums throughout North America, Western Europe, Southern and Eastern Africa, and East Asia.

During the 1980s, as the national discussion about language use and language rights intensified in the USA, Paulston wrote extensively on the topic and frequently participated in discussions on the continuing debate over *English Only* versus *English Plus*. A strong proponent of *English Plus* (i.e., the right of individuals residing in the USA to have the opportunity to develop proficiency in English *plus* a language in addition to English), she noted in one of her widely disseminated and quoted articles (1997, p. 85) that “Our responsibility as academics is the careful exploration of the nature of language rights and their consequences.”

The breadth and the depth of her personal contacts with the pioneers in the field of sociolinguistics (e.g., Charles Ferguson, Joshua Fishman, John Gumperz, Dell Hymes) became abundantly clear during the editing of *The Early Days of Sociolinguistics: Memories and Reflections* (Paulston & Tucker, 1997) when virtually all of the contributors were long-time personal friends or colleagues of hers.

Paulston's service contributions to the broader academic community have also been noteworthy, as evidenced through her diligent work as Board member and President of international TESOL, member of the Board of Trustees of CAL (the Center for Applied Linguistics), and active participant in the Committee on Intensive English Programs as well as member of associations such as ACTFL (the American Council on the Teaching of Foreign Languages), LSA (the Linguistic Society of America), and MLA (the Modern Language Association). Through each of these organizations, by her participation in their annual meetings and through contributions to their journals and newsletters, Paulston has eloquently documented and told a compelling story of the importance of individuals' linguistic rights.

Paulston continues her work as Professor Emerita at the university, where she regularly offers courses such as "Language Policies and the Education of Linguistic Minorities," advises students, and remains in active electronic contact with colleagues and professional associates throughout the world.

Pavlenko, Aneta

JEAN-MARC DEWAELE

Aneta Pavlenko rose to prominence in the late 1990s with a number of highly original contributions in various areas of applied linguistics and bilingualism research. She grew up in Kiev, Ukraine, when it was still part of the USSR. Her father was a filmmaker and her mother a teacher of English. She is probably one of the few applied linguists who knows how to handle a Kalashnikov, a skill she learned in her high-school military-education classes. Because of her Jewish origins, she was turned down by Kiev Pedagogical Institute of Foreign Languages, and eventually obtained her BA and MA in French and linguistics by correspondence, while working full time. On April 26, 1986, she was getting ready for her birthday party when Chernobyl exploded 30 kilometers north of Kiev. In 1989, the combined effects of anti-Semitism and the fear of the effects of Chernobyl on her newborn baby forced her to emigrate. Together with other Soviet immigrants, she spent several months in a refugee settlement in Italy, where she taught English to immigrant children and helped other refugees in dealing with Italian authorities. Eventually, with the help of a Jewish organization, she settled with her mother and son in the USA. For two years she worked as a part-time language instructor in several Pennsylvanian colleges. In 1992 she began her doctoral studies in linguistics at Cornell University; she produced her dissertation under the supervision of Jim Lantolf, with whom she coauthored two influential papers (Lantolf & Pavlenko, 1995; Pavlenko & Lantolf, 2000). She graduated in 1997 and was hired as an assistant professor at Temple University in Philadelphia where she obtained tenure in 2003 and was promoted to full professor in 2008. She is currently professor in, and coordinator of, the TESOL program in the Department of Curriculum, Instruction, and Technology in Education.

Her interests range from multilingualism, gender studies, identities in multilingual contexts, and language ideologies (Pavlenko, Blackledge, Piller, & Teutsch-Dwyer, 2004) to autobiographies of multilinguals (Pavlenko, 2007), the experience of immigration (Pavlenko, 2003), bilingualism and cognition (Jarvis & Pavlenko, 2008), the bilingual lexicon (Pavlenko, 2009), emotion words and second language acquisition (Dewaele & Pavlenko, 2002), and language and education policies in post-Soviet countries (Pavlenko, 2008a). She has published highly original papers in all these areas, and guest-edited several special issues for international journals.

Her first major paper (Pavlenko, 1999) appeared in *Bilingualism: Language and Cognition* when François Grosjean was principal editor. In this paper she argued against the conflation of semantic and conceptual levels of representation in contemporary models of the bilingual lexicon and proposed to distinguish between lexical, semantic, and conceptual levels of representation. Her research on emotion concepts in Russian and English of monolinguals and bilinguals illustrated the dynamic nature of the bilingual conceptual store. She called for more attention to crosslinguistic and cross-cultural differences in conceptualization of different phenomena. She revisited these issues in Pavlenko (2008b) in the same journal. She argued that emotion words are a separate class of words in the mental lexicon, represented and processed differently from abstract and concrete words. She also demonstrated that emotion concepts vary across languages and that bilinguals' concepts are often distinct from those of monolingual speakers. She finally pointed out

that words in different languages display different levels of emotionality which affects code switching and language choice in multilinguals.

While a lot of her work is dedicated to psycholinguistic issues (Pavlenko, 1999), she also pays attention to sociolinguistic aspects of the second language acquisition process and reflects on epistemological and methodological choices in research. In Pavlenko (2007) she argued that autobiographies describing the acculturation process of second language learners and users constitute valid “evidence” for the field of SLA if treated as narratives and not as facts.

Aneta Pavlenko has published in most of the top journals in the field, including *The International Journal of Bilingualism*, *Journal of Multilingual and Multicultural Development*, *Multilingua*, *Applied Linguistics*, *Pragmatics and Cognition*, *TESOL Quarterly*, *Bilingualism: Language and Cognition*, *Issues in Applied Linguistics*, *Annual Review of Applied Linguistics*, *Mental Lexicon*, *The Modern Language Journal*, and *Language Learning*. Pavlenko’s (2008c) study on non-native speakers of English and the Miranda warnings won the 2009 TESOL Award for Distinguished Research.

She has edited or coedited six books and produced a monograph, Pavlenko (2005), which won the Book Prize of the British Association of Applied Linguistics in 2006. She also coauthored a book with Scott Jarvis on crosslinguistic influence in language and cognition (Jarvis & Pavlenko, 2008).

She has organized panels and presented papers at international conferences on bilingualism, applied linguistics, sociolinguistics, pragmatics, TESOL, and second language acquisition. Having become a major figure in the field, Aneta Pavlenko was invited in 2009 as plenary speaker to EUROSLA 19 in Cork and the Sixth International Conference on Third Language Acquisition and Multilingualism in Bolzano. She serves as reviewer for numerous journals and publishers, was reviews editor of the *International Journal of Bilingual Education and Bilingualism* from 2001 to 2010 and is currently associate editor for *The International Journal of Bilingualism*.

Aneta Pavlenko has established a wide international network of scholars and friends from different disciplines and theoretical backgrounds. She can be credited for bringing the work of Russian-speaking applied linguists to the attention of the rest of the world by inviting them to join the AILA Research Network “Multilingualism in Post-Soviet Countries” and contribute to panels at international conferences and to special issues in English about the language situation in countries formerly belonging to the USSR. She has established her reputation as a tough, insightful, and perfectionist reviewer and editor, and an inspiration to all those who have collaborated with her.

Peer Response in Second Language Writing

JUN LIU

'Peer response' refers to

the use of learners as sources of information and interactants for each other in such a way that learners assume role and responsibilities normally taken on by a formally trained teacher, tutor, or editor in commenting on and critiquing each other's drafts in both written and oral formats in the process of writing. (Liu & Hansen, 2002, p. 1)

In the field of second language writing, the term is sometimes synonymous with "peer review," "peer editing," or "peer feedback."

Grounded in both cognitive and psycholinguistic theories, and supported by process writing theory, peer response enables writers to get feedback on their drafts from several students and helps build audience awareness, reading-writing connections, and linguistic, rhetorical, and content schemas through multiple exposures to a text. Lying at the heart of peer response is collaborative learning theory that states that socially constructed knowledge occurs through communication among peers. Likewise, psycholinguistics provides a number of rationales for using group work that supports peer response as a means for students to negotiate meaning as they help each other revise their papers. It has also been found that learning in writing groups is reciprocal and improves students' work (Mangelsdorf & Schlumberger, 1992; Hu, 2005) while giving them additional practice in the target language. Students individually may not have all the knowledge or resources available to complete a task successfully, but "pooling the resources that a group of peers brings with them to the task" may be more beneficial to them (Bruffee, 1984, p. 64). Research results also indicate that collective scaffolding that occurs as a result of peer response allows individual novice second language writers to become collective experts navigating complex problem solving through negotiation and collaboration (de Guerrero & Villamil, 2000).

As Liu and Hansen (2002) note, peer response in second language writing has revealed both strengths and weaknesses in four major areas. Cognitively speaking, peer response activities help students take charge of their own learning, build critical thinking skills, and consolidate their knowledge of writing, although sometimes peer comments are questionable and thus difficult to incorporate in revision. With regard to the social effects, peer response activities can enhance students' communication, build their social skills, and provide them with a supportive social network, even though they can sometimes be anxiety provoking and lead to communication breakdown. Linguistically, peer response activities are considered good opportunities for students to build their linguistic knowledge and improve both oral and written discourse, despite the fact that students tend to over-emphasize local structure and comments on grammar. From a pedagogical perspective, peer response activities can be conducted with students who are at different proficiency levels and different stages of writing, although it is sometimes more time-consuming and less efficient.

2 PEER RESPONSE IN SECOND LANGUAGE WRITING

Peer response in second language writing generally takes two different formats: (a) the traditional format that includes both written response through pen and paper and face-to-face communication and (b) the innovative format that relies on computer-mediated communication (CMC) in both synchronous (real time) and asynchronous (delayed time) modes. Each format has both benefits and constraints that the teacher will need to weigh, taking into consideration factors such as learners' learning styles, language proficiency levels, facilities, and the nature of the tasks in writing. In the traditional format, students usually read peers' drafts with a number of guided questions that help make the review more focused and engaging. This format makes it easy for students to make marginal notes and comments. However, in some instances, poor handwriting, limited space for comments, and lack of consistency can cause problems. One commonly used follow-up procedure with the traditional format is oral, face-to-face group commenting, or pair commenting which provide opportunities for clarification, confirmation, probing, and in-depth discussion and meaning negotiation so that everyone in the group can benefit from the process. Nevertheless, the effectiveness of this approach depends highly on individual students' communication styles and skills. For instance, the silence of some students due to different cultural traditions can sometimes discourage open communication and result in the more outspoken students dominating the discussion. Sometimes the lack of familiarity among peers or the limited time can cause the nature of interaction to be too brief or superficial. On the other hand, the CMC format extends the interaction possibilities beyond the classroom and hence "beyond its time constraints and the usual limited circle of interlocutors of classroom pair and group work" (Belcher, 1999, p. 255). Research indicates that synchronous peer response (e.g., using closed chat rooms) can provide a platform for discussion that is highly engaging and stimulating without students being together. It also encourages a playful atmosphere that enhances improvisation, motivation, and group cohesion. However, it is dependent on individual students' speed in typing as students are unable to offer detailed comments under time pressure. Moreover, turn taking could be problematic and create uncertainties and frustration when a student receives contradictory comments all at the same time (Liu & Sadler, 2003). Alternatively, peer response that happens asynchronously (e.g., using emails or bulletin boards) allows sufficient time for each student to write his or her comments without the constraints of time and space. However, it can be time-consuming and sometimes lacks the spontaneity of group commenting and interaction. In situations where students are not equipped with computers at home, this task is not practical.

The roles of participants in peer response activities are numerous. In any group work, there will be a leader who serves in the role of a facilitator to set the pace and get the ball rolling. This role should be rotated among group members in order to enable everyone in a group an equal opportunity to be group leader. Being a good listener and taking an active role in discussion and collaboration with peers is essential for the success of peer response. When the paper of a team member is being critiqued, the author of that paper should be open-minded, willing to listen to both positive and negative comments, and take the opportunity to probe and seek clarification in order to understand why certain comments are made. The teacher, on the other hand, should play different roles in the process of peer response activities—that of facilitator, monitor, timekeeper, and occasionally participant-observer contributing to discussion as a member of the team and confirming uncertainties and answering questions whenever appropriate.

What should students focus on when they comment on their peers' papers? Should they focus on content, rhetoric, grammar, or a combination of all three? This has been a concern for many second language writers and their teachers (Hyland & Hyland, 2006). Many second language writing teachers concur that the most helpful comments are those that address global issues such as content and rhetoric as specifically as possible (Liu and

Hansen, 2002). For example, a helpful comment on a draft might focus on audience and organization. However, students have the tendency to follow their teacher's lead in commenting on their peers' papers. If the teacher typically comments on grammatical issues on the students' papers, the students will likely follow suit when they make comments. Therefore, if the teacher wants her students to focus on a particular aspect in writing, then she should provide them with examples of the kind of comments she expects them to make and make explicit the specific requirements for peer response activities.

It is clear that the success of peer response in second language writing depends largely on the training and modeling the teacher provides in the process of peer response activities including prior training, ongoing supervision, and post-reflection. Second language writing teachers should be aware of their students' diverse needs, writing skills, prior peer response experiences, and motivation in order to engage them in peer response activities through clear instruction and guidelines for commenting. Teachers should show students how to do a good job by: (a) using task-specific peer response examples from previous students' drafts, completed peer response sheets, and revisions based on the comments; (b) giving their own teacher responses on the same task-specific peer response sheets; and (c) suggesting some useful expressions for responding to their peers' papers. The effectiveness of peer response largely depends on the extent to which students have developed appropriate attitudes and behaviors for giving and receiving peer feedback, for example, open-mindedness, politeness, turn-taking strategies, and communicative competence. Finally, in order to help students make informed decisions about their writing, it is necessary to follow up on peer review with guidance on how to incorporate peer comments judiciously in making revisions.

Like much of the process in second language writing, peer response activities have become a common practice in second language writing classrooms. Nevertheless, there are still a few areas that cause concern and criticism. For instance, teachers and researchers are puzzled about the extent to which peer comments help improve the drafts when teacher feedback is present (Xu & Liu, 2007). They also question when is the right time for peer response to take place in the writing process, in between the first and second drafts, the second and final draft, or after each draft. This will determine the foci of peer response as well as the intervention of the teacher feedback (Hyland & Hyland, 2006). Furthermore, they question whether it is more effective to conduct peer review with advanced learners grouped by discipline or beginner and intermediate students in general second language writing classes (Hansen & Liu, 2005). These and other unresolved questions make peer response a promising area for further research in second language writing.

Pennycook, Alastair

BONNY NORTON

When I welcome new graduate students to our department at the University of British Columbia, I always remind them that their fellow students may well constitute their most supportive professional network over the course of their careers. Alastair Pennycook was one of the many outstanding graduate students I met at Ontario Institute for Studies in Education (OISE), University of Toronto in the late 1980s, and it gives me great pleasure to reflect on the ways in which the qualities Alastair exhibited as a doctoral student, including a formidable intelligence and a generosity of spirit, have had such a profound effect on applied linguistics and language education over the past two decades.

Alastair's sojourn in Canada was only one stop on a professional journey that began in the UK, and has included extended periods in France, Germany, Japan, China, Hong Kong, and, most recently, Australia, where he is now Professor at the University of Technology, Sydney. While sailing in Sydney's spectacular harbor is one of Alastair's favorite pastimes, a review of his extensive publications suggests that he must struggle to find time at the helm. A highly productive scholar, Alastair's research is always cutting-edge, remarkable in breadth, and compelling in depth. Given the limited scope of this biography, I will focus on the highly cited books that he has written, as these provide insight into the trajectory of his ideas over time and his engagement in diverse sites of practice. These books extend and enrich many of the key insights published in his numerous journal articles, some of the most influential being Pennycook (1989, 1994b, 1996, 2003).

While still a doctoral student at OISE, Alastair worked tirelessly on the first of his groundbreaking books, *The Cultural Politics of English as an International Language* (Pennycook, 1994a), which won the 1995 BAAL (British Association of Applied Linguistics) Book Award. By drawing on a range of scholarly sources, including postcolonial literature, critical pedagogy, and language policy, this important work raised timely questions about the impact of the global spread of English and remains highly relevant almost two decades later. His focus on what he called the "worldliness" of English struck a chord in the field of applied linguistics and reminded us that English can never be removed from the social, cultural, economic, and political contexts in which it is used.

Many of the ideas Alastair developed in his 1994 book receive fuller treatment in a later text, *English and the Discourses of Colonialism* (Pennycook, 1998) in which he explores in greater depth the relationship between the English language and its colonial legacy. Through detailed analysis of travel writing, newspaper articles, and popular books on English, Alastair examines how colonial practice impacted both the colonizers and the colonized, across both time and space. With reference to such key authors as Chinua Achebe and Njabulo Ndebele, Alastair concludes that postcolonial writing could serve as a counter-discourse to the dominance of English internationally.

While few scholars took issue with Alastair's work on the globalization of English, his book *Critical Applied Linguistics: A Critical Introduction* (Pennycook, 2001) created a little discomfort amongst some applied linguistics scholars in the new millennium. Examining different notions of what it means to be "critical," Alastair made a convincing case for defining critical applied linguistics as an attempt to understand the relationship between language, power, and possibility in the field. Central themes identified for closer examination

addressed the politics (respectively) of knowledge, language, texts, pedagogy, and difference, all of which remain important sites of struggle in contemporary applied linguistics.

As Alastair's reputation grew, his numerous plenary invitations took him to every region of the world, where he often escaped banquet halls and crowded lobbies for the back streets of urban life. On street corners and in tenement buildings, he took the opportunity to continue his investigation of transgressive responses to the dominance of English. What emerged was an exciting line of research on international hip-hop culture, brilliantly examined in *Global Englishes and Transcultural Flows* (Pennycook, 2007), yet another BAAL award-winning book. Framing his analysis with reference to performative theory, Alastair brought a new lens to an important topic, insisting that we rethink the relationship between language, culture, and pedagogy in a unique manifestation of the "worldliness" of English.

Alastair's most recent monograph, *Language as a Local Practice* (Pennycook, 2010), takes up his interest in urban language use, extends earlier work on theories of language, and enriches our understanding of multilingualism. Drawing on a variety of contexts of language use, from bank machines and postcards to urban graffiti and mission statements, he suggests that we need to extend our understanding of language use in context by considering how language, locality, and practice are not only related but mutually constitutive.

While Alastair's monographs have served to consolidate a compelling trajectory of ideas across time, he has also worked collaboratively with like-minded scholars Sinfree Makoni, Samy Alim, and Awad Ibrahim to edit two collections of work that provide greater visibility to applied linguistics scholars in different regions of the world. In *Disinventing and Reconstituting Languages* (Makoni & Pennycook, 2007) Sinfree, Alastair, and a wide range of scholars challenge the very foundations of much thinking on "language," making the case that language remains an invention, and that linguistic metalanguage constructs the world in particular ways. In the second edited book, *Global Linguistic Flows: Hip Hop Cultures, Youth Identities, and the Politics of Language* (Alim, Ibrahim, & Pennycook, 2009), Alastair and contributors take the opportunity to extend many ideas published in *Global Englishes and Transcultural Flows*, while offering new insights on the ethnographic study of language, popular culture, and hip-hop at the intriguing intersection between global and local cultural practices.

Alastair and I no longer have spirited conversations in the always crowded pub, "The Duke," around the corner from OISE. However, we are still regularly connecting online with yet another OISE graduate, Brian Morgan, in our Multilingual Matters book series, *Critical Language and Literacy Studies*, initiated by Vaidehi Ramanathan. The mentoring of new and emerging scholars will no doubt enrich the legacy of the distinguished scholar, Alastair Pennycook.

Personality in Second Language Acquisition

JEAN-MARC DEWAELE

Personality Traits

The intuition that certain stable and distinctive personality traits may be linked to success in second language acquisition (SLA) has proved irresistible among many foreign-language teachers and applied linguists over recent decades. The fact that so few significant relationships between personality traits and linguistic measures in the second language (L2) have been identified has puzzled researchers.

This search for the psychological sources of individual differences in SLA has been compared to the search for the Holy Grail where researchers, “like Arthur’s knights, stumbling through the night, are guided by a stubborn belief that something must be there, glimpsing tantalizing flashes of light from a distance, only to discover that their discoveries looked rather pale in the daylight” (Dewaele, 2009, p. 625). The fact that findings have been relatively meager may be linked to the intrinsic interdisciplinary nature of SLA and the need to combine considerable theoretical knowledge and methodological skill in personality psychology and social psychology, as well as in applied linguistics, educational psychology, sociolinguistics, and psycholinguistics (p. 625). Moreover, the personality variables of language learners interact with a complex and dynamic socioeducational context, which means that it becomes very difficult to disentangle the effect of personality among a multitude of cognitive, social, and situational factors that contribute to SLA and L2 production. Indeed, the effect of some personality traits can remain invisible in some situations or tasks, but may surface in other circumstances. It is thus not surprising that personality variables are typically linked to small effect sizes on L2 variables. This entry briefly presents the background of research into personality traits before offering a short overview of the link between specific dimensions and SLA.

Personality inventories are based on factor analyses of scores on personality-describing adjectives. The resulting dimensions are universal, in other words the same dimensions appear in questionnaires in various languages across the world. Personality inventories rely on self-report from participants who have to indicate whether, or to what extent, they agree that a particular statement applies to them. Typical items are “Are you a worrier?” or “Can you get a party going?” There are typically 10 items or more per dimension, which allows researchers to calculate individual scores on the various dimensions. Traits are thus continuous dimensions of variability and scores are normally distributed. In other words, there are more people situated in the middle of a personality dimension than at the extremes. This means, for example, that there are more “ambiverts” than either extraverts or introverts (Furnham & Heaven, 1999).

The two dominant taxonomies are H. J. and M. W. Eysenck’s “Giant Three” (Eysenck & Eysenck, 1985) and the so-called “Big-Five construct.” Costa and McCrae (1992) used questionnaire statements to construct the NEO Personality Inventory based on the Big-Five framework, with over 180 items designed to assess how respondents typically think, act, and feel. Goldberg subsequently developed a shorter, 50-item personality inventory, which

2 PERSONALITY IN SECOND LANGUAGE ACQUISITION

is available free of charge online from the International Personality Item Pool (2001), a public-domain personality resource.

Eysenck's Giant Three are Extraversion versus Introversion; Neuroticism versus Emotional Stability; and Psychoticism versus Tender-Mindedness. The Big-Five construct retains Eysenck's first two dimensions but replaces the third one with three separate dimensions: Conscientiousness, Agreeableness, and Openness-to-Experience. The Big-Five personality traits are situated at the summit of the hierarchy. There are many more "lower-order" personality traits that are often correlated with Big-Five traits but also explain unique variance. A number of such traits have been considered in SLA, namely creativity, emotional intelligence, foreign-language anxiety, and perfectionism.

While there is abundant evidence that "super-traits" and "lower-order" traits determine behavior in general, it is less clear to what extent they affect SLA and L2 production. A short overview of some of the SLA research linked to personality traits will be presented.

Extraversion

According to Eysenck and Eysenck (1985), variation on this dimension is linked to the amount of cortical arousal, which leads to different behaviors. Extraverts are under-aroused and compensate for this by tending toward activities that involve greater sensory stimulation. Introverts are over-aroused and therefore try to avoid over-arousing situations. Extraverts have been found to be more stress resistant because of their lower levels of the neurotransmitter dopamine (Lieberman & Rosenthal, 2001). Introverts, who have naturally higher levels of dopamine, suffer more from the extra dopamine released in stressful situations, which disturbs optimal innervation in the dorsolateral prefrontal cortex and impairs attentional and working-memory processes (Lieberman & Rosenthal, 2001). The combination of the extraverts' speed of retrieval of information from memory and their higher degree of physiological stress resistance could explain their better performance in high-stimulation environments (Dewaele, 2002a). Extraversion has been linked to quantity and intensity of interpersonal interaction, activity level, need for stimulation, and capacity for joy. The typical extravert is sociable, active, talkative, person-oriented, optimistic, fun-loving, and affectionate. The typical introvert is reserved, sober, aloof, unexuberant, task-oriented, retiring, and quiet (Costa & McCrae, 1992).

Applied linguists have focused their attention on the possible effect of extraversion on success in L2 learning, the expectation being that the more talkative, extravert learners would have a natural advantage in the acquisition of the L2 compared to their more introverted peers. However, studies where extraversion scores are correlated with language-test scores have revealed inconsistent results. For instance, Naiman, Fröhlich, Stern, and Todesco (1978) examined whether "good language learners" (i.e., Canadian high-school students learning French as an L2 who scored highest on a French listening test and an imitation test) had any distinctive psychological profile. They expected a positive correlation between extraversion and test scores. When this did not appear, they questioned the construct validity of the Eysenck Personality Inventory or EPI (Naiman et al., 1978, p. 67), rather than asking whether their choice of dependent variables might have affected the results. The ensuing negative publicity for extraversion was so strong that applied linguists have generally shunned it. Dewaele and Furnham (1999) have suggested that a wider variety of more sophisticated linguistic variables, covering not only written language but also natural communicative oral language, might have revealed that the construct validity of the EPI was not to blame for the lack of expected relationships. Indeed, studies that have correlated extraversion scores with oral fluency measures do report significant effects (Dewaele & Furnham, 1999).

Results on the effect of extraversion on success in L2 learning (as measured by grades) have been inconclusive (Dewaele, 2007). Ehrman (2008) analyzed the psychological profile (using the Myers-Briggs Type Indicator) of a sample of the top two percent best language learners out of 3,145 learners. Only one type was significantly overrepresented, namely introverted-intuitive-thinking-judging (INTJ) types (p. 64). Ehrman concludes that

the best language learners tend to have introverted personalities, a finding which runs contrary to much of the literature, and, even, to pedagogical intuition. The best learners are intuitive and they are logical and precise thinkers who are able to exercise judgment. (p. 70)

Introverts typically perform slightly better on written tests compared to extraverts, who tend to perform better in oral tasks (Robinson, Gabriel, & Katchan, 1994). Research linking extraversion with functional practice strategies in real communicative L2 situations has shown that extraverts tend to prefer social strategies, like cooperation with others or asking for clarification, and also use more functional practice strategies like seeking opportunities to use a foreign language outside the class environment (Wakamoto, 2009). The extraverts' inclination to take risks seems to extend to their linguistic behavior, including the use of more stigmatized language and a willingness to engage in potentially more "dangerous" emotion-laden topics (Dewaele & Pavlenko, 2002).

Introverts have been found to do slightly better on L2 vocabulary tests (Carrell, Prince, & Astika, 1996; van Daele, Housen, Pierrard, & Debruyne, 2006). MacIntyre, Clément, and Noels (2007) also showed that the learning situation interacts with learners' degree of extraversion in vocabulary learning. Introverts were found to perform best after having studied in a very familiar situation, while the extraverts performed best in conditions involving a moderate degree of novelty.

Research has also probed individual differences in the extent to which L2 learners feel different while operating in an L2. English students of L2 French showed a negative link between extraversion and feeling different (Wilson, 2008). Wilson argues that the more reflective introverts may observe objective differences in their voice and manner when using the L2 but also feel liberated from the inhibitions linked to their L1 behavior. Polish L2 users in the UK and Ireland have shown the opposite pattern (Ożańska-Ponikwia, 2011), with extraversion positively linked to the feeling of difference in the L2 as well as to the amount of L2 usage.

Neuroticism

People who score high on Neuroticism (N) are prone to psychological distress, unrealistic ideas, excessive cravings or urges, and maladaptive coping responses. High-N individuals agree with the following descriptors: worried, nervous, emotional, insecure, inadequate, hypochondriacal. Low-N individuals are calm, relaxed, unemotional, hardy, secure, self-satisfied (Costa & McCrae, 1992).

Little research has examined the effect of Neuroticism in SLA. Neuroticism was found to be unrelated to foreign-language attitudes and foreign-language grades of Flemish students (Dewaele, 2007), although a tendency toward a positive relationship was found in the English L3 of Flemish learners (Dewaele, 2002a).

High-N foreign-language students seem to perform better in oral examination tasks and written tests (Robinson et al., 1994). There also appears to be a negative correlation between Neuroticism and difficulties in expressing emotions in both the L1 and the L2 (Ożańska-Ponikwia, 2011).

Psychoticism

Psychoticism (P) measures tough-mindedness (Furnham & Heaven, 1999, p. 230). It is seen as being composed of Agreeableness and Conscientiousness in the Big-Five Model. People scoring high on Psychoticism “tend to be hostile, cold, aggressive, and have poor interpersonal relations” (p. 327). Dewaele (2002b) found that high-P Flemish learners of English L3 suffered less from foreign-language anxiety in English than low-P participants. The effect of psychoticism on language grades was limited: High-P scorers tended to have lower grades in French L2, but not in L1, L3, or L4 (Dewaele, 2007).

Conscientiousness

Conscientiousness refers to the degree of organization, persistence, and motivation in goal-directed behavior. Individuals who score high on Conscientiousness tend to be organized, reliable, hard-working, self-disciplined, punctual, scrupulous, neat, ambitious, and persevering, while those who score low tend to be aimless, unreliable, lazy, careless, lax, negligent, weak-willed, and hedonistic (Costa & McCrae, 1992).

Highly conscientious L2 learners would be expected to be harder-working language learners, but this should not affect their L2 production. Wilson (2008) reported that British students studying French L2 who scored higher on Conscientiousness were more likely to complete the course successfully.

Ehrman’s (2008) description of participants who combine intuition and thinking fit the profile of high Conscientiousness. She describes them as being merciless with themselves, always trying to improve their competence and mastery of the target language. They are also more likely to be strategic thinkers, using metacognitive strategies such as goal-setting, self-assessment, and self-monitoring. They have a penchant for analysis, love relatively fine distinctions, and strive to be precise in their use of words, expressions, and grammar.

Openness-to-Experience

Openness-to-Experience reflects proactive seeking and appreciation of experience for its own sake, toleration for and exploration of the unfamiliar. Individuals with high scores on Openness-to-Experience are curious, creative, original, imaginative, and untraditional, and have broad interests. Those with low scores are conventional, down to earth, inartistic, and unanalytical, and have narrow interests (Costa & McCrae, 1992). Openness-to-Experience is significantly related to intelligence (Costa & McCrae, 1992). This dimension is similar to “Open-Mindedness,” which refers to an open and unprejudiced attitude toward out-group members and toward different cultural norms and values. It seems to be a good predictor of foreign-language learning achievement. Verhoeven and Vermeer (2002) found that Openness-to-Experience and, to a lesser extent, Conscientiousness and Extraversion were linked to the development of basic organizational skills involving lexical, syntactic, discourse, and functional abilities, the acquisition of pragmatic skills, and the development of monitoring strategies among young L2 learners in the Netherlands.

Ehrman (2008) reported that Openness is correlated with intuition in the Myers-Briggs Type Indicator. Learners who score high on this dimension “concentrate on meaning, possibilities, and usually accept constant change” (p. 66). They are typically seeking hidden patterns, are high-ability readers, and can pick up native-like ways of self-expression (p. 66).

Polish L2 users in the UK and Ireland who scored high on Openness were also significantly more likely to feel different when using their L2, and to use their L2 more frequently (Ożańska-Ponikwia, 2011).

Agreeableness

Agreeableness assesses the quality of one's interpersonal orientation along a continuum from compassion to antagonism in thoughts, feelings, and actions. Individuals who score high on this dimension are soft-hearted, good-natured, trusting, helpful, forgiving, gullible, and straightforward, while those who score low are cynical, rude, suspicious, uncooperative, vengeful, ruthless, irritable, and manipulative.

Polish L2 users in the UK and Ireland who scored high on Agreeableness were also significantly more likely to feel different when using their L2, possibly because they noticed changes in their own facial and other nonverbal expressions while speaking in the L2 (Ożańska-Ponikwia, 2011).

Creativity

Creativity reflects the complex interplay of cognitive, psychological, motivational, and social factors. Intellect is an important component of creativity, which also correlates with Openness-to-Experience. Albert and Kormos (2004) found that creativity, originality, flexibility, and creative fluency had weak but significant links to performance in oral narrative tasks among Hungarian learners of English. Creative fluency was positively correlated with the quantity of talk but originality was negatively correlated with the quantity of talk, and positive correlations were found between originality and the complexity of narratives.

Self-Efficacy

Self-efficacy is a psychological construct that could influence motivation. Hsieh and Kang (2010) investigated the link between Korean learners' self-efficacy, attribution, and test grades in English L2. The authors found that learners with higher levels of self-efficacy attributed their test results to more internal and personal control factors than those who reported lower self-efficacy levels. Unsuccessful learners with higher self-efficacy made stronger personal control attributions than learners with lower self-efficacy.

Foreign-Language (Classroom) Anxiety and Trait Emotional Intelligence

Foreign-language anxiety (FLA) is defined as "the feeling of tension and apprehension specifically associated with second language (L2) contexts, including speaking, listening, and learning" (MacIntyre and Gardner, 1994, p. 284). More specifically, foreign-language classroom anxiety (FLCA) can be defined as "a distinct complex of self-perceptions, beliefs, feelings and behaviors related to classroom learning arising from the uniqueness of the language learning process" (Horwitz, Horwitz, & Cope, 1986, p. 128). FLCA is linked to any activity in the foreign language, but is typically highest for speaking. It affects foreign-language learners at all levels and even non-native foreign-language teachers.

Research on FLA/FLCA has strong pedagogical implications, as it has been reported to interfere negatively with learning and performance (Horwitz, 2001). High levels of FLCA in the classroom have been linked to students discontinuing their study of foreign languages (Dewaele & Thirtle, 2009). Variation in FLA and FLCA has been linked to various socio-biographical variables, quality and quantity of affordances through the knowledge of typologically related or other languages, age, gender, academic achievement, prior history

of visiting foreign countries, prior high-school experience with foreign languages, expected overall average for current language course, perceived scholastic competence, and perceived self-worth (Onwuegbuzie, Bailey, & Daley, 1999; Dewaele, Petrides, & Furnham, 2008; Dewaele, 2010).

Trait emotional intelligence (EI)—also called trait emotional self-efficacy—is based on the idea that individuals differ in the extent to which they attend to, process, and utilize affect-laden information of an intrapersonal or interpersonal nature (Dewaele et al., 2008). Trait EI is measured via self-report questionnaires and is located at the lower levels of personality hierarchies. It includes the following subscales: adaptability, assertiveness, emotion perception, emotion expression, emotion management, emotion regulation, impulsiveness, relationships, self-esteem, self-motivation, social competence, stress management. Trait EI has been found to correlate negatively with Neuroticism, but positively with Extraversion, Openness, and Conscientiousness.

Trait EI has been positively linked to L2 usage (Ożańska-Ponikwia, 2011) and negatively linked to communicative anxiety in the L1, L2, L3, and L4 of adult multilinguals (Dewaele et al., 2008). Emotionally intelligent individuals were less anxious, probably because of their better ability to gauge the emotional state of their interlocutor. A range of other sociobiographical variables were linked to communicative anxiety.

Foreign-Language (Classroom) Anxiety and Perfectionism

Perfectionism has been defined as a less exaggerated form of obsessive-compulsive disorder. Perfectionist L2 learners tend to make slower progress because the fear of making mistakes hinders their learning. They are inhibited about classroom participation, unwilling to volunteer a response to a question unless they are absolutely sure of the correct answer, and react badly to minor failures (Gregersen & Horwitz, 2002). The authors found that anxious learners were more perfectionist, setting themselves higher personal performance standards, procrastinated more, were more fearful of evaluation, and were more concerned about errors.

Conclusion

Does personality have an effect on SLA and L2 production? The tentative answer is “yes,” but no single psychological variable can be identified as having more than a small effect in explaining variance in L2 dependent variables. The main reason is that psychological variables interact with each other and with sociobiographical and educational variables in a potentially infinite and unpredictable way across contexts. L2 learners with similar personality profiles may differ enormously in their progress and ultimate attainment because of variation in the broad context. No single personality trait therefore predetermines success in SLA. At best some combinations of traits create a potential for success, which the learner can decide to boost through hard work and practice.

Phenomenology and Hermeneutics

LAURENT CAMMARATA

Phenomenology is an umbrella term encompassing hermeneutics, a distinct branch that emerged from a schism within the phenomenological school of thought. Since its origin, phenomenology has been defined in various ways such as the *science of phenomena* (Heidegger, 1927/1996), the *science of appearances* (when the word is taken literally as explained by Ricoeur, 1967), or the *study of essences* (Merleau-Ponty, 1945). This may explain why it has been labeled and operationalized in so many different ways: *lifeworld* or *reflective lifeworld research* (e.g., Husserl, 1936/1970; Merleau-Ponty, 1945; Dahlberg, Dahlberg, & Nyström, 2008), *descriptive empirical phenomenology* (e.g., Giorgi, 1985), *hermeneutics or hermeneutic phenomenology* (e.g., Heidegger, 1927/1996; van Manen, 1997; Gadamer, 2002), and *phenomenography* (Marton, 1981), to name only a few. Regardless of the labels adopted to describe phenomenology and its offspring hermeneutics, and regardless of the differences that distinguish the two research methodologies, they are both rigorous scientific approaches aiming at unveiling the meaning of human lived experiences as they are lived by those who experience them.

Origin

Phenomenology originated as a philosophical movement, which is now considered one of the 20th century's most influential currents of European thought (Moran, 2000). Phenomenology is, originally, a philosophical project at the heart of a scientific revolution initiated more than a hundred years ago by Edmund Husserl (1859–1938), one which has been credited with the redrafting of the architecture of conventional inquiry to include alternative paradigms better suited to making human behaviors and experiences intelligible. In fact, the nature of the phenomenological revolution can be succinctly defined as an attempt at reinstating subjectivity and historicity as the core elements of scientific inquiry. In order to understand why this was a revolutionary move at the time and the impact of the phenomenological school of thought on the scientific world, it is important to place it within its own historical context.

As originally conceived, phenomenology can be understood as a reaction against what is known as the *objectivist turn* corresponding to Galileo's introduction of the scientific method more than four hundred years ago (Polkinghorne, 2003). The scientific method defined its aim as the objectification of experience by the removal of all historical elements (Gadamer, 2002), leading science to focus exclusively on the object pole of experience (Hut, 2003a; 2003b). Such a definition had the pervasive effect of obliterating the subject from the research frame. As a result, it left out "two-thirds of the fiber of every experiential situation we normally find ourselves in" (Hut, 2003b, p. 10). Having removed from the analysis anything about subjects' lived experience, the scientific method, Husserl and later phenomenologists would argue, was incapable of revealing how human beings come to know the world (an epistemological agenda at the heart of Husserlian phenomenology) and how they come to be in the world (an ontological agenda at the heart of Heideggerian hermeneutic phenomenology).

2 PHENOMENOLOGY AND HERMENEUTICS

The attempt to completely remove the human subject's role in science led Husserl and many others after him to criticize and oppose the positivist (also commonly referred to as the objectivist) approach to scientific inquiry. In the field of psychology, building on Brentano's work (Moran, 2000; Dahlberg et al., 2008), Husserl was the first to challenge the status quo by criticizing the traditional distinction between the concepts of subject and object and underscoring the need to focus the scientific exploratory lens on understanding human experience itself. Focusing exploration on the meaning of human lived experiences is a goal central to phenomenological inquiry, and it is considered a prerequisite to any scientific agenda endeavoring to study the natural world: "Because the descriptions of natural objects are derived from experience, experience itself must be clearly understood before a firm foundation can be established for the sciences studying the natural world" (Polkinghorne, 1989, p. 41).

Phenomenology as Empirical Human Science

Phenomenology is a research approach that, much like those in natural sciences, aims at generating knowledge claims which describe as closely as possible the reality they are trying to explain, depict, or unveil. Unlike natural science studies, though, phenomenology aims to study and reveal human experiences. More specifically, the focus is on the meaning of human lived experiences for those who live them because human lived experiences are considered to be "the fundamental locus of knowledge" (Polkinghorne, 1989, p. 43). Phenomenological questions are oriented toward meaning and ask *What does this experience mean for those who have lived it?* In the field of applied linguistics, an appropriate phenomenological question might focus on a particular phenomenon such as language learning or teaching. It would ask about the meaning experiences have for those who live them—the meaning they attribute to the experiences. It could be either broad in scope, such as *What does teaching or learning mean to those who teach and learn?* (van Manen, 1997), or narrower and pointed, such as *What does it mean to genuinely learn?* (Colaizzi, 1978). Phenomenologists assert that these objects of study cannot be researched using the means of observation and statistical analysis commonly found in mainstream empirical science since they are deeply hidden in human consciousness.

The elaboration of very complex theories regarding the nature of knowledge and human consciousness led Husserl and other phenomenologists after him to develop particular methodological tools (e.g., the epoché/bracketing, phenomenological and eidetic reduction) to guide the research process and reveal to us what is most hidden: the meaning of our taken-for-granted, everyday, lived experiences. Phenomenology's strong philosophical and theoretical foundation translates into meticulous attempts at generating knowledge claims about the realm of human experiences. It has often been labeled as empirical human science. In fact, Husserl (1917/1981) argued that phenomenology "is inferior in methodological rigor to none of the modern sciences" (§4).

Phenomenology: Clarifying the Nature and Goals of This Mode of Inquiry

The scientific mission of phenomenological inquiry is to reveal the structures that produce meaning in consciousness. It is the exclusive focus on the subject's experienced meaning that distinguishes phenomenological research from other approaches that focus instead on descriptions of subjects' actions or behaviors (Polkinghorne, 1989). The type of knowledge phenomenological inquiry generates can shed light on key aspects of the teaching and learning realms, such as clarifying the nature of individual learning experiences (e.g.,

Colaizzi, 1978) as well as teaching experiences (e.g., van Manen, 1997). Thus, it can give us unique insights into why educational projects may succeed or fail (Fullan, 2001) and, therefore, is a research approach particularly well suited to answering questions that interrogate the nature of the experience lived by the main actors involved in the educational experience: the learners' and teachers' own lived experience of learning and teaching.

Phenomenology is a *descriptive* science as opposed to an *interpretive* one. This distinction is important as it differentiates phenomenology from other forms of interpretive human science research. Description, Giorgi (1992) explains, "is the clarification of the meaning of the objects of experience precisely as experienced" (p. 122). As it was originally intended, phenomenology attempts to answer the epistemological question *How do we come to know the world?* In simple terms, it is the study of what appears or is given to consciousness through our experience of the world. Phenomenology can, thus, be succinctly defined as "the method for the description and analysis of consciousness and what is given to consciousness" (Velarde-Mayol, 2000, p. 12), that is, it aims to study and describe "how things and events are for the consciousness that beholds them and not how they are in themselves" (Giorgi, 1986, p. 6).

In order to accomplish this aim, Husserl developed various procedures to examine the structure of *intentionality*, which is to be understood as the structure of human experience itself. Husserl's theory of *intentionality* posits that consciousness is always transitive, that is, it is always directed toward an object. This is one of the key assumptions of the phenomenological research method (Giorgi, 1984). The theory of intentionality is at the heart of the phenomenological agenda to understand what experiences are like for the persons living them in everyday existence (van Manen, 1997).

Phenomenology as a research approach favors what Gadamer calls *authentic/genuine questioning*, which occurs when one remains open and can acknowledge that the answer has not yet been determined (Palmer, 1969). Phenomenology guides the researcher to seek, prior to any research endeavor, a presuppositionless state in which the examination of a phenomenon can be initiated. Husserl defined the phenomenological aim as *returning to the things themselves*; that is, returning to the pre-scientific and pre-reflective realm that we inhabit when we are immersed in the natural attitude, which he called the naive approach to the world (Dahlberg et al., 2008). To this end, at the core of any phenomenological endeavor is the initial attempt to neutralize all assumptions we have about the world so that they will not clutter our understanding. Such a move is meant to allow the phenomenon under study to shine through as it really is; in essence, the move is an attempt at taming our taken-for-granted existence in order to evoke in us genuine curiosity.

The Control of Pre-Understanding, Tradition, and Prejudice

For a phenomenological project to be considered successful, it must first and foremost be based on freedom from presuppositions or prejudices. In phenomenology, the researcher's freedom from presupposition is achieved through *phenomenological reduction*, a technical term designating "the principal methodological rule of phenomenology" (Taminiaux, 2004, p. 7). Husserl described the *phenomenological reduction* as the suspension of all preexisting knowledge, "a radical suspension of Nature" (Husserl, 1917/1981, § 37) that needs to be systematically applied. The reduction's principal aim, van Manen (2003) explains, is to re-achieve a direct and primitive contact with the world as we experience it or as it shows itself (the world we experience pre-reflectively) rather than how we conceptualize it (the world as we interpret it). As such, it is an essential component of a science that has as its primary aim to make intelligible all objectivity by "bracketing all positing of being and investigating the subjective modes of givenness" (Gadamer, 2002, p. 244).

Most contemporary phenomenologists agree with the claim that it is impossible to practice phenomenology without understanding the full significance of the reduction and the importance of bracketing.

Phenomenology sets the researcher in a place where she or he is ideally free from the boundaries of already-made ideas and preset categories (assumptions) in which knowledge is naturally organized and which, if not accounted for, can prevent the phenomenon from disclosing itself as it really is. It is the capacity of the researcher to bracket previous knowledge and become self-aware—that is, the continuous seeking of a state of *openness*, an act that Husserl believed possible when transcendence was set as an overarching goal in the research process—that has been the source of important debates and critiques, particularly among those involved in developing this approach. It is principally this debate that led Heidegger, once Husserl's apprentice, to redefine phenomenology and its agenda. Heidegger's opposition to the transcendental turn proposed by Husserl is at the origin of a schism within phenomenology that led to the elaboration of the hermeneutics school of thought. Additionally, in contrast with Husserlian phenomenology, Heideggerian hermeneutics attempts to answer an ontological question rather than an epistemological one—that is, it attempts to answer the question of how humans come to exist, how they come to be in the world, rather than how they come to know the world. This shift of focus in phenomenology is often referred to as the *ontological turn* (Palmer, 1969, pp. 136–7).

Hermeneutics: Main Differences and Commonalities

Phenomenology evolved into two major schools of thought over the 20th century: one that is best characterized as descriptive phenomenology and which is associated with Husserl's transcendental phenomenology, and hermeneutics, an interpretive form generally associated with Heidegger and his followers. Van Manen (1997) helps us better understand what distinguishes both approaches by stating that “it is possible to make a distinction in human science research between phenomenology (as pure description of lived experience) and hermeneutics (as interpretation of experience via some ‘text’ or via some symbolic form)” (p. 25).

Descriptive phenomenology is generally associated with the work of Husserl (his transcendental phenomenology) and his collaborators Eugen Fink, Tymieniecka, and Van Breda, among others (van Manen, 2000). The principal aim of descriptive phenomenology, also referred to as Husserlian phenomenology, is to try to generate *pure* descriptions in order to answer an epistemological question: What is the nature of human consciousness and human knowledge? In other words, how do humans come to know?

Hermeneutics, which could simply be defined as the philosophy of understanding gained through interpretation, was originally principally applied to the practice of interpretation of biblical texts (exegesis) and later was also applied to the translation and study of non-biblical literature, also known as philology (Dahlberg, Drew, & Nyström, 2001). Thus, Gadamer (2002) explains, it “developed into a system and made the basis of all human sciences” (p. 165).

The meaning of hermeneutics has evolved over time to become a method for interpretation, as well as a “theory of how to understand the act of understanding itself” (Dahlberg et al., 2001, p. 71). Heidegger's redefinition of phenomenology was a reaction against Husserl's call for transcendental (or pure) consciousness as the key to phenomenological analysis. The transcendental turn in Husserlian phenomenology was intended to increase *validity* regarding the knowledge claims generated about the essence of the phenomenon under scrutiny, by requiring phenomenologists to “step outside their viewpoint in order to see a phenomenon apart from the encumbrances of one's experience of it” (Dahlberg et al., 2001, p. 93). As Dahlberg and her colleagues explain, Husserl believed that, with proper training,

one could clearly step outside and free oneself momentarily from all prejudices and theoretical knowledge by bracketing one's own previous theories (performing the epoché, a form of methodological reduction). The bracketing of belief was intended "to reveal the life-world, which would in turn, he thought, open up the way to pure phenomenology" (Ashworth, 1996, p. 7). According to Husserl, this was a crucial step to undertake since the lifeworld is not directly accessible to individuals because their perception and interpretation of the world are naturally dominated by scientific knowledge. It is the reason why Husserl (1936/1970) believed that the epoché of objective science, that is, "[the suspension] of any critical position-taking which is interested in their truth or falsity, even any position on their guiding idea of an objective knowledge of the world" (p. 135), was a necessary step to go through before attempting any phenomenological work.

Heidegger came to oppose the idea that one could ever perform such a feat and rejected Husserl's pursuit of the transcendental ideal, considering it a mistake (Ashworth, 1996). With Heidegger, hermeneutics was to become more than a simple variation on the theme of Husserlian phenomenology. It ultimately evolved in a distinct school of thought as Heidegger "rethought the concept of phenomenology itself, so that the phenomenology and phenomenological method take on radically different character" (Palmer, 1969, p. 126).

As mentioned earlier, the focus of Heideggerian hermeneutics is different from that of Husserlian phenomenology as it attempts to answer a different type of questions regarding the nature of human lived experiences. In hermeneutics, questions focus on how humans come to exist, how they come to be in the world (an ontological agenda). Furthermore, in contrast with phenomenologists, hermeneutists do not believe that pure objectivity can be achieved, or that one should attempt to achieve a state of complete neutrality, since *pre-understanding* is a necessary precondition for acquiring knowledge. For Heidegger, in fact, pre-understanding is not something that one can do without; rather, it represents a condition for new knowledge, since "our understanding of the everyday world is derived from our interpretation of it" (Dahlberg et al., 2001, p. 78). Instead of attempting to neutralize or *bracket* all forms of pre-understanding (what Gadamer refers to as our prejudices) via the use of the epoché, as Husserl's phenomenological analysis would prescribe, hermeneutic phenomenologists favor a continuous focus on trying to bring to light those assumptions so that they can become known to us and, therefore, be accounted for. Gadamer (2002) explains this different process very clearly: the important thing for an individual trying to understand a text is "to be aware of one's own bias, so that the text can present itself in all its otherness and thus assert its own truth against one's own fore-meaning" (p. 269).

Even though these two schools of thought approach the study of human lived experience in a somewhat dissimilar manner, both research approaches share the same overarching goal: to insure that the phenomenon under scrutiny is allowed to shine through in its authenticity so that life can be captured and described as it is lived. In that regard, when applied to both phenomenology and hermeneutics, concerns of *rigor*, which refer to issues of *validity* within the context of human science inquiry, can be considered alike, as rigor is reflected in both research approaches in the continuous struggle of the researcher to remain self-aware: a continuous attempt to achieve what can be thought as a scientific openness and ethical authenticity in trying to stick with the evidence disclosed in the text.

Differentiating both approaches remains, nevertheless, an important matter since the two aim at answering different questions and also involve following some distinct steps in the process of generating knowledge claims. In an attempt to distinguish the two approaches, Giorgi (1992) explains that associating all human science research with interpretive science is excluding other alternative research approaches such as phenomenology, a descriptive science. Giorgi goes on to argue "that the descriptive and interpretive attitudes are not reducible to each other but rather are aptitudes based on strategies tied to situation" (p. 121). An understanding of the rules that govern the elaboration of such projects is,

therefore, crucial and implies a clarification of two key terms: *description* (associated with phenomenological work) versus *interpretation* (associated with hermeneutical work). An examination of the process as well as the product of phenomenological and hermeneutical research as distinct approaches involving distinct steps to follow is, therefore, important when considering the value of the research claims they generate.

Potential Application to the Field of Applied Linguistics

Although both phenomenology and hermeneutics have been recognized as valuable research approaches commonly utilized today in varied fields such as psychology (e.g., Colaizzi, 1978; Giorgi, 1985; Polkinghorne, 1989), caring science (e.g., Johnson, 1998; Carlsson, Dahlberg, & Drew, 2000), teaching and teacher education (e.g., Bollnow, 1989; van Manen, 1991, 1997, 2011), and curriculum (see Pinar, Reynolds, Slattery, & Taubman, 2000, pp. 404–46), they remain unexploited in the field of applied linguistics. Among the many reasons that might explain the absence of phenomenology within the field is the fact that it is difficult to become familiar with phenomenology as a research approach suitable for scientific explorations within the context of applied linguistics. The principal challenge lies in the fact that phenomenology, at its origin a philosophical approach to the inquiry into everyday lived experiences, is far from being a unified philosophy and, thus, has led to the development of varied research approaches whose origin must be well understood if they are to be appropriately utilized.

The potential of phenomenological and hermeneutical inquiry for applied linguistics has not yet been tapped, although there is a growing interest in exploring the experience of the principal actors engaged in learning and teaching languages. Phenomenology and hermeneutics are approaches to inquiry particularly relevant to explorations that focus on trying to understand and describe the experience lived by language learners and teachers. In the context of language learning, much of the experience of language learners remains to be understood when it comes to their actual experience of taming an unfamiliar linguistic framework as well as their experience of wielding it. In regard to language learners' lived experiences, many important if not primordial questions of an epistemological as well as ontological nature remain to be posed that phenomenology and hermeneutics could help address, such as:

- What does it mean to learn an additional language from the perspective of those engaged in the learning process? What distinguishes this learning experience from others?
- What is it really like to learn an additional language while immersed in a community where the target language of study is spoken? In contrast, what is it like to learn a foreign language in an environment where the language is not or only partially spoken (e.g., one's own community)?
- What is it really like to learn a foreign language that is highly valued in one's social context? What is it like to learn the language of the *enemy*?
- What is it really like to communicate in a language we do not yet possess?
- What is it really like to be evaluated while taking a traditional test in the second/foreign-language classroom? What is it like to be assessed on language performance in front of others in a language that is not one's own?
- What is the experience of being comfortable, that is, unafraid to share with others in the classroom, like for those who are beginning to learn an additional language?
- What is it like to experience flow in the second/foreign-language classroom?

When it comes to teaching, much of language teachers' actual experience of being immersed in the classroom world remains to be explored and understood. Such knowledge is essential if we are able to understand challenges at play as language teachers develop professionally, the experience of praxis itself, and barriers to change that often define the success or failure of many school reforms. To date, only a very few studies in the field have investigated language teachers' experiences using a phenomenological or hermeneutical research lens. Two studies recently published (Cammarata, 2009, 2010), for instance, explore language teachers' experience of attempting to transition from conventional models of instruction now prevalent in US K-12 schools to alternative models more in harmony with contemporary understandings of how languages are best learned and taught. An additional study by Cammarata and Tedick (in press) explores the lived experiences of immersion teachers as they attempt to balance language in the context of content instruction. These studies address important gaps in the field of foreign-language education and teacher education more broadly by redirecting the research lens onto examination of the nature of teachers' lived experiences, their impact on thinking, and their relationship to practice and innovation. Although still very rare in the field of applied linguistics, studies employing a phenomenological or hermeneutical approach to inquiry have demonstrated that these research approaches are relevant research tools when it comes to filling important gaps in second language acquisition research.

Conclusion

It is important to keep in mind that the focus of phenomenological and hermeneutical research is on the experience itself rather than on the individuals who experience it. As a consequence, phenomenological as well as hermeneutical inquiry do not formally give a voice to specific individuals and cannot, therefore, be used for that purpose. Nevertheless, both phenomenology and hermeneutics can help challenge the most dominant notions that are in place by unveiling the nature of some experiences that might either not be well understood or have been misrepresented. By so doing, phenomenological and hermeneutical research can help highlight some crucial issues that need to be addressed today, issues that are not necessarily well addressed when using conventional means of inquiry. Perhaps the strongest rationale for considering phenomenology as an appropriate research framework for research exploring language teaching and learning is the fact that such research models, as van Manen (1997) pertinently points out, can be a source of change, as they can bring back the human factor to the center of any educational debate and facilitate the identification of issues which are rarely addressed. Even if phenomenology or hermeneutics do not directly problem solve, as van Manen is the first to admit, they are a *critical philosophy of action* which can be an engine of change and allow for necessary modifications to occur, oppressive situations to be revealed, and revolutionary decisions to be examined (van Manen, 1997). Thus, the use of the phenomenological and hermeneutical research approaches, with their principal aim of uncovering the meaning of human lived experiences, can help expand the current understanding of teaching and learning within this context by exploring these phenomena from a different perspective or lens, that is, exploring experiences of teaching and learning from the perspective of those who live them.

Phillipson, Robert

TOVE SKUTNABB-KANGAS

Robert Phillipson was born in the United Kingdom in 1942. He was a chorister at St. Paul's Cathedral Choir School in London from 1950 to 1956 (the choir toured the United States for two months in 1953), after which he was a scholar at Cranbrook School in Kent. In 1961 he spent six months in Austria, Germany, and France before studying at the University of Cambridge. He completed a BA in Modern Languages and Law in 1964, and was employed by the British Council from 1964 to 1973.

Robert Phillipson trained as a teacher of English as a Foreign Language at the British Institute in Madrid, Spain, and from 1965 to 1968 was attached to the British Institute in Algiers and various Algerian higher education institutions. This involvement in a country that had recently achieved independence kindled a lifelong interest in colonialism, language policy, and efforts to achieve a more just world order.

Phillipson studied for an MA in Linguistics and English Language Teaching at the University of Leeds in 1968–9. His thesis was on intonation in court cross-examination, using recordings from the Survey of English Usage at University College, London. This was an early effort at studying language in context before discourse analysis and forensic linguistics became established. He also took an elective course in African Literature in English.

From 1969 to 1972 Phillipson was attached to the British Council in Yugoslavia, with responsibility for organizing and teaching on in-service training courses for teachers of English, in partnership with the Yugoslav authorities in each republic, and a colleague at the US embassy. From August 1972 he was employed for a year in London at the English-Teaching Information Centre as head of a unit collecting and disseminating information on English teaching in Europe. This work was funded by the British government as a result of the UK joining the European Union (then the European Economic Community) as a member state in 1973.

Phillipson emigrated to Denmark in 1973. He was briefly employed at the University of Copenhagen, where he collaborated with Danish scholars on a large empirical study of the learning of English in Danish education. This led to the book *Learner Language and Language Learning* (Færch, Haastrup, & Phillipson, 1984), which was published in both the UK and Denmark. Phillipson was employed at the University of Roskilde from 1973 to 2000. The university was a revolutionary educational experiment, with multidisciplinary student group projects as the main system of learning, and a requirement that fundamental academic disciplines should be integrated into problem-oriented, methodologically explicit reports. Phillipson was deeply involved in university administration with lengthy periods as head of the Department of Languages and Culture, dean of Humanities, and chair of PhD studies for the whole university. He was appointed as research professor at Copenhagen Business School in 2000, where he is now professor emeritus.

Phillipson has published extensively on a wide range of language policy topics but is probably still best known for his path-breaking book *Linguistic Imperialism*, published by Oxford University Press in 1992. This had its origins in a doctoral thesis that was awarded a distinction at the University of Amsterdam in 1990. The book has also been published in China and India, and in translation into Arabic. Many factors led to the elaboration of a

work that sees English teaching in wider political and economic contexts, past and present: first-hand experience of British and American promotion of English worldwide, including access to the British Council's confidential files; a realization, largely triggered by scholars from "third world" countries, that dependence on Western "aid" was perpetuating inequality locally and globally, with educational language policy playing a decisive role; experiencing that Scandinavian donors were providing refugees from apartheid with English learning materials from the UK that were inappropriate culturally and linguistically; and inspiration from the work of his wife, Tove Skutnabb-Kangas, in theorizing how inequality by means of language, linguisticism, could lead to the analysis of how structures and ideologies of English linguistic imperialism could be approached. She and Phillipson have edited several books and written scores of articles together.

Linguistic Imperialism was controversial because it challenged the dominant paradigm of English teaching as a technocratic, apolitical task. The book reveals that the Anglo-American English teaching business is essentially determined by geopolitical and commercial interests. In language teaching a key set of tenets (monolingualism, the native speaker as the ideal teacher, the earlier the better, etc.) is shown by scholarship on language learning and multilingualism to be fundamentally false. The book has maintained its relevance because these ideas are still influential, especially in Asian countries—where importing native speakers has not significantly improved the learning of English—and in other parts of the world.

Many developments have continued the global dominance of English into the neoimperial world of the early 21st century. Central among them are the place of English at the top of a hierarchy of languages in most international fora, the prevalence of education solely through the medium of English in many postcolonial contexts (against solid research evidence), the mushrooming of English-medium universities worldwide, and the myth of English as a "lingua franca" serving all equally well. The book *Linguistic Imperialism Continued* (Phillipson, 2009) brings together articles and book reviews written by Phillipson since 2000 that explore such issues and also develop a theoretical framework for analyzing contemporary patterns of linguistic imperialism. The linguistic capital that English represents, and which accounts for its popularity, can be converted into other types of capital, economic and political. But linguistic capital accumulation, like other types of capital accumulation, typically involves processes of dispossession of the capital of speakers of other languages. Hence the importance of language policy formation, nationally and internationally, in order to maintain linguistic diversity along with other types of diversity, in ecolinguistic balance.

One means of counteracting linguistic imperialism is through ensuring observance of principles of linguistic human rights. Elaboration of this as a field of scholarly activity, in tandem with political struggles for more respect for human rights, has required looking in depth at the evolution of relevant national and international laws, and making a case for language rights as fundamental human rights. This is now increasingly accepted, though the struggle for the implementation of such rights is uphill in most parts of the world, as can be seen from the many contributions to two coedited anthologies, *Linguistic Human Rights: Overcoming Linguistic Discrimination* (Skutnabb-Kangas & Phillipson, 1994), and *Language: A Right and a Resource. Approaching Linguistic Human Rights* (Kontra, Phillipson, Skutnabb-Kangas, & Várady, 1999). The edited volume *Rights to Language: Equity, Power and Education* (Phillipson, 2000) has 50 contributors, from anthropology, applied linguistics, communication, discourse analysis, economics, education, law, linguistics, media studies, policy analysis, political science, psychology, social theory, and sociolinguistics, as well as creative writers. Phillipson has always seen multi- and transdisciplinary work as necessary.

The expanding role of English in Continental Europe has been a major interest since the 1990s. Phillipson spent half a year studying language policy in Australia, India, and

Singapore as a stepping-stone towards the analysis of how an increased use of English interlocks with the intensive integration of the European Union, both in EU institutions and in member states. The EU has expanded from a small set of six countries in the 1950s to 27 member states in 2010, with 23 official and working languages. The management of multilingualism, nationally and internationally, in speech (assisted by interpretation) and writing (through translation) is therefore complex. Market forces risk strengthening English at the expense of all other languages, hence the need for explicit language policy formation so as to maintain linguistic diversity as well as ensuring effective international collaboration. *English-Only Europe? Challenging Language Policy* (Phillipson, 2003) covers the history of (some) languages in Europe, global trends impacting on European language policy, language use in EU institutions, criteria for equitable communication, and recommendations for action on language policies.

Phillipson has been attached to universities in Cambridge, UK, Hungary, Australia, and India. He continues to collaborate with Indian scholars (see Skutnabb-Kangas, Phillipson, Mohanty, & Panda, 2009). He has been invited to guest lecture and advise on language policy in most parts of the world. He has functioned as an expert for the Commission of the European Union, evaluating projects concerned with promoting multilingualism, as well as applications for research funding on language policy topics. Phillipson has contributed dozens of entries to various encyclopedias, handbooks, and so forth, and written some 200 book chapters and journal articles, in addition to authored and edited books (for a list of publications, see <http://www.cbs.dk/Forskning/Institutter-centre/Institutter/ISV/Menu/Medarbejdere/Menu/Videnskabelige/Videnskabelige/Professor-Emeritus/Phillipson>). He was awarded the UNESCO *Linguapax* prize in 2010.

Phillipson is married, with three children and seven grandchildren. He lives on an ecological smallholding.

Phonetics and Phonology: Overview

JOHN LEVIS AND MURRAY MUNRO

Although *phonetics* and *phonology* both concern the study of speech, linguists have traditionally considered these as different areas of study. *Phonetics* subsumes the physical aspects of speech production and their relation to speech perception, while *phonology* addresses the functional and systemic nature of the sounds of particular languages. In the analysis of spoken language, however, the two areas are not clearly demarcated, and therefore applied linguists do not always observe the distinction. Among second language (L2) specialists, for example, *phonology* is sometimes used as a cover term for a wide range of aspects of second language learning relating to pronunciation. Thus, L2 *phonology* often refers in a general way to the acquisition of the sounds of a new language. Textbooks covering *applied phonology* such as Pennington (1996) address a diverse array of issues in speech production and perception, including topics that might more properly be regarded as phonetics. At the same time, *applied phonetics* texts, such as Edwards (1997), cover some of the same material as phonology texts.

A historical overview (see PHONETICS AND PHONOLOGY: HISTORICAL OVERVIEW) of pronunciation teaching reveals a heavy influence of *articulatory phonetics*, which refers to the ways in which the vocal apparatus—including the lips, teeth, tongue, and vocal folds—is used to produce speech. Concepts from this subfield may be applied in the teaching of L2 pronunciation, as when a teacher describes the articulatory postures and dynamics required for a particular consonant production or explains the relationship between stress and its components of pitch, loudness, and length. Research in articulatory phonetics is sometimes concerned with describing patterns of production that distinguish first language (L1) from L2 speech. Early analyses of articulatory phenomena relied on observations of the readily visible parts of the vocal tract and on phoneticians' conscious reflection on their own speech production. In recent decades, such work has been aided by vocal tract imaging techniques including ultrasound, magnetic resonance imaging (MRI), and a variety of other technologies that permit unobtrusive monitoring of structures within the vocal tract and their movements. To date, however, the role of these approaches in L2 teaching and research has been limited (Gick, Bernhardt, Bacsfalvi, & Wilson, 2008).

A critical question in phonetics and phonology concerns the ways in which languages are encoded in their orthographies because systematically representing the sounds of language on paper is important in the study of speech. It would be convenient if an ORTHOGRAPHY, or spelling system, had one and only one sound or syllable associated with each symbol. Although some orthographies—like that of Spanish—approach this ideal, perfect correspondence occurs only in phonetic transcription, as in the INTERNATIONAL PHONETIC ALPHABET, in which each sound is represented by a single symbol or cluster of symbols. Orthographies are at best phonemic systems, with allophonic variation not directly represented in spelling. This fact has implications for learning to read, since L1 readers learn with a sound system already in place. Further implications arise in the development of orthographies for unwritten languages. Another issue concerns the ways in which orthography can be used to facilitate pronunciation teaching. Most second language learners are literate and learn pronunciation partly or mainly through reading. In doing so, they must learn to decode unfamiliar words successfully (Dickerson, 1992). Even when

2 PHONETICS AND PHONOLOGY: OVERVIEW

the connection between SOUND AND SPELLING is relatively transparent, the influences of L1 orthography and of unfamiliar orthographic conventions add complexity to the decoding process and may require more explicit attention to prediction (see PREDICTION IN TEACHING PRONUNCIATION) using rules.

Acoustic phonetics concerns the analysis of speech in terms of its measurable physical properties. Until the late 20th century such analysis was restricted to phonetics research laboratories with specialized equipment. Today, however, technological innovations and freely available SPEECH ANALYSIS SOFTWARE such as Praat (Boersma & Weenink, 2010) have made sophisticated analyses possible for anyone with the appropriate expertise. The acoustic phonetic approach has been applied extensively in L2 speech research. For example, numerous studies have examined voice onset time (VOT) differences between first and second language speakers, variation in formant frequencies, and differences in the durations of SEGMENTS. However, much less work has been carried out on suprasegmental phenomena and VOICE QUALITY in L2 production. An understanding of acoustic phonetic analyses requires specialized knowledge not typical of learners and teachers; therefore, direct applications in language teaching are limited. Nonetheless, automated acoustic analyses can provide useful feedback to students on some aspects of their oral productions. Hardison (2004), for instance, observed improvements in L2 prosody when learners saw representations of their speech on a real-time pitch display.

Because of the overlap between phonetics and phonology, many of the concepts discussed above cannot be regarded as falling exclusively within one domain or the other. Phenomena usually seen as more pertinent to *phonology* include processes such as segmental substitution, epenthesis, and deletion and their consequences on the structure of SYLLABLES. L2 structuralist phonology exploited the contrastive analysis framework, which was concerned with transfer and interference from the L1 at the level of the allophone. That unit of analysis is still common in research and teaching, and much recent work continues the tradition of COMPARATIVE PHONETICS AND PHONOLOGY that emphasizes the effect of differences in L1 and L2 phonological inventories on L2 learners' areas of ease and difficulty. However, GENERATIVE SECOND LANGUAGE PHONOLOGY, which appeared in the mid-20th century, approached the PHONOLOGICAL ANALYSIS of L2 learning in terms of binary distinctive features. Later innovations have included applications of markedness and phonological universals to account for aspects of L2 learning that appear to be inexplicable in terms of L1 influences, and therefore fall out of the purview of contrastive analysis. Although these recent frameworks have played a noteworthy role in L2 research, their impact on language teaching is limited.

L2 SPEECH PERCEPTION research describes and accounts for the ways that language users distinguish and categorize speech phenomena. Language experience exerts a powerful influence on speech perception. By the end of the first year of life, infants become closely attuned to native-language contrasts and lose their sensitivity to sound distinctions in other languages (Werker & Tees, 1984). Although it facilitates first language acquisition, this process may underlie many difficulties in L2 PHONOLOGICAL ACQUISITION. Because language learners tend to assimilate L2 phones to their native-language representations (Best & Tyler, 2007), they may fail to perceive critical phonological distinctions in L2. Theory and research (Flege, 1995) link perception to difficulties in L2 production in that aspects of speech that are incorrectly perceived are unlikely to be correctly produced. A relatively new but promising line of work on this issue concerns SECOND LANGUAGE SPEECH PERCEPTION AND THE BRAIN. A potential pedagogical application of L2 perception research is perceptual training. Many studies have indicated that L2 perception can be improved with laboratory procedures, and that production may automatically improve as a result (Bradlow, Pisoni, Yamada, & Tohkura, 1997). Although much perceptual research has examined L2 learners of English, more work is now being carried out on learners of other

languages, and attention is being directed to phonetic phenomena that are not relevant in English, including tone (see SUPRASEGMENTALS: TONE). While this line of work seems very promising, the classroom benefits of perceptual training remain largely untested.

The study of *sociophonetics* focuses on social evaluations of pronunciation differences from speaker to speaker, from region to region, and according to situation. Phonetic variation first of all marks differences in register. Formal speech differs from informal speech, and speakers mark their awareness of social situations with varying degrees of care in their enunciation. Pronunciation variations also mark dialect differences, especially in vowel sounds, and to a lesser extent, consonants. Listeners use accent to impute social status, according to how others fit into social groupings and how they themselves fit or would like to fit. This means that accent can stand in for other factors in discrimination (Wolfram & Schilling-Estes, 2006) in areas such as housing and employment (Purnell, Idsard, & Baugh, 1999). Pronunciation shibboleths such as the pronunciation of *ask* as *aks* or *wash* as *warsh* in US English, or the non-pronunciation of [h] in British English (Muggleston, 1995) may provide a basis for stereotyping and discrimination. Finally, pronunciation is used in positive ways as a marker of group identity, such that otherwise socially disfavored pronunciations can enhance group acceptance (Gatbonton, Trofimovich, & Magid, 2005). All these considerations come into play in the SOCIAL EVALUATION OF SECOND LANGUAGE SPEECH.

Although the study of L2 phonological acquisition mirrors some other themes in second language acquisition, much less research has been carried out on this topic than on pragmatics, grammar, and vocabulary. The research has, however, indicated that phonological acquisition is unique because L2 speech is commonly characterized by a FOREIGN ACCENT, in contrast to potential attainment of other aspects of language. Because L2 accents are so common and so salient to listeners, they have fundamental social consequences and even play a major role in LANGUAGE ANALYSIS FOR THE DETERMINATION OF ORIGIN (LADO). Many fundamental questions about acquisition remain only partially answered. We know that L2 learners commonly acquire at least some aspects of the L2 sound system, but we understand little of how L2 pronunciation develops and whether it follows the same route as L1 phonological learning. Nor have we established the degree to which foreign accents arise because of maturational constraints (e.g., a critical period), input and experience, muscular patterns, and desires to reflect identity. It is also unclear which L2 phonological features require PRONUNCIATION INSTRUCTION and which features develop with exposure alone, as well as which PRONUNCIATION TEACHING METHODS AND TECHNIQUES are most effective. Nor are the contributions of individual variation in motivation and aptitude well understood. These matters, along with SOCIAL INFLUENCES ON SECOND LANGUAGE SPEECH ACQUISITION are likely to receive much greater attention in acquisition research in the years to come.

An important application of phonetics and phonology is the teaching of pronunciation to L2 learners. Pronunciation played a central role in several influential teaching methodologies in the early and mid-20th century, though later it was de-emphasized because adult learners rarely achieved native accents (Pica, 1994). Over the past three decades, the study of pronunciation has regained its importance because of a new emphasis on research and teaching of INTELLIGIBILITY and FLUENCY (Munro & Derwing, 1995; Derwing, Munro & Thomson, 2008). This orientation on L2 speech recognizes that ACCENT REDUCTION in itself is not necessarily of communicative value. This refocusing of concern is tied to a greater interest in suprasegmentals. Although teaching stress (see SUPRASEGMENTALS: STRESS) and intonation (see SUPRASEGMENTALS: INTONATION) had strong advocates during the middle decades of the 20th century (O'Connor & Arnold, 1973) it was not until the 1980s that there was a shift away from an instructional focus on segmentals (vowels and consonants) toward suprasegmentals and voice quality (Esling & Wong, 1983; Gilbert, 1984).

4 PHONETICS AND PHONOLOGY: OVERVIEW

Targets for pronunciation teaching are usually chosen based on teachers' informed intuition and knowledge of students' L1 sound systems. More recent research has examined which pronunciation features have the greatest impact on intelligibility. Here, specialists are increasingly concerned with the problem of identifying appropriate PRONUNCIATION MODELS, particularly given the growing attention to PRONUNCIATION IN WORLD ENGLISHES. A closely related issue is how PRONUNCIATION ASSESSMENT is best carried out. Although the need for pronunciation teaching is now generally accepted, many important issues remain unresolved, including what goals teachers should emphasize, when pronunciation teaching is effective, how pronunciation fits with other areas such as listening and vocabulary, and what relative importance should be given to segmentals and suprasegmentals. Further work on such matters as rhythm (see SUPRASEGMENTALS: RHYTHM), discourse intonation (see SUPRASEGMENTALS: DISCOURSE INTONATION), and prosody in conversation (see SUPRASEGMENTALS: PROSODY IN CONVERSATION) will shed more light on that important issue.

Technology provides many tools for the study of phonetics and phonology. These make it possible to measure accurately temporal phenomena such as vowel duration, fundamental frequency for evaluating intonation, and spectral properties for visualizing various aspects of utterances. Applied linguists use many of these tools, including computer visualization of the speech signal when developing COMPUTER-ASSISTED PRONUNCIATION TEACHING for L2 learners, and audio and video recording to describe, analyze, and illustrate speech patterns accurately. One widespread pedagogical application employs visualization techniques such as pitch tracings and spectrograms. The former has been the more successful technique, likely because its iconicity (e.g., traces go up as pitch goes up) is easier for learners and teachers to interpret. Another widespread application is ASR (automatic speech recognition), known for its role in dictation software. It has also been used to provide feedback to L2 learners, develop phone-answering programs, and provide voice recognition security. Notably, ASR is far superior in applications for L1 speakers than in L2 applications.

Phonological Acquisition

NICLAS ABRAHAMSSON

Introduction

Within only a few years, children master the grammatical and phonological elements, rules and structures of their first language (L1). That is, barring any history of speech pathology, language impairment, or severe isolation from language exposure, children eventually become as proficient in their L1 as their models are and will speak the language with the same native accent as adult speakers of their immediate language community do. On the other hand, most people who acquire or learn a second language (L2) end up speaking that language in ways that differ from the native-speaker norm, both grammatically and phonologically; except in cases of very early acquisition, L2 speech is characterized by a foreign accent that often reveals the speaker's L1 background. Depending on a number of learner-internal and -external factors, a non-native accent can range from heavy and difficult to understand to very subtle and hardly noticeable.

The child acquiring an L1 is faced with the enormous task of learning how to accurately perceive and articulate all the speech sounds of the target language. An important phase in this process is the babbling stage, during which the child explores numerous attested and unattested combinations of vowels and consonants. Moreover, the child must acquire all the phonemic distinctions at the segmental level, the feature distinctions at the sub-segmental level (e.g., [±voice] of consonants), and all their allophonic manifestations and distributions (e.g., aspirated [p^h] in *pit* but unaspirated [p] after /s/, as in *spit*). In addition, the child needs to acquire suprasegmentals, that is, the *syllable structure*, *phonotactic constraints*, and the *prosodic system*, which comprises *dynamic* aspects (i.e., stress and rhythm), *tonal* aspects (i.e., intonation), and *temporal* aspects (i.e., duration).

For the L2 learner, on the other hand, an established phonological system is already in place. Therefore, rather than learning a whole new phonological system, the task often consists only of *adjusting* perception and articulation of familiar speech sounds, phoneme and feature distinctions, and allophonic distributions. For example, the English learner of L2 Swedish must make /ɪ/ and /u/ slightly more closed and change the place of articulation of /t/ and /d/ from alveolar to dental. However, this does not mean there is nothing to learn or to add to the existing phonology. For example, an English speaker learning Zulu needs to introduce clicks—a whole new class of speech sounds—into the phonological system. Additionally, the English learner of Swedish who wants to pronounce a word such as *pytt* [pyt] accurately needs to use an already familiar subsegmental feature, lip rounding, on a class of vowels to which this feature does not apply in English: front vowels (i.e., [ɪ] + rounding → [y]). This process creates a novel phonemic distinction, in which the new, rounded vowel [y] takes up some of the acoustic space previously occupied partly by the unrounded [ɪ]. Similarly, the L2 learner needs to acquire the syllable structure and prosodic aspects of the target language, sometimes in relation to what is already known through the L1 (e.g., phonotactic constraints that may be stricter, looser, or simply different) and sometimes from scratch (e.g., an L1 speaker of a nontone language like English, learning a tone language, such as Chinese).

2 PHONOLOGICAL ACQUISITION

To provide an overview of the central issues in L2 phonological acquisition, the current entry focuses on (a) the characteristics of variation and development of interlanguage phonology; (b) crosslinguistic influences and universal constraints in phonological acquisition; and (c) the relation between age of acquisition and ultimate attainment of L2 pronunciation. The emphasis will thus be on adult acquisition of a *second* language phonology, although comparisons with L1 phonological acquisition will also be addressed when relevant.

Phonological Variation and Development

In L2 acquisition research, the developing grammar is usually referred to as the learner's interlanguage (IL) (Selinker, 1972). Accordingly, the developing phonological system is the IL phonology, or simply *inter-phonology*. It consists of (a) phonological rules, sounds, and features that are identical to those of the L1 and L2, and (b) rules, elements, and features that are entirely different and independent from those of the L1 and L2. IL systems differ from natural languages in certain ways; for example, by exhibiting relatively high synchronic variability and diachronic instability (which simply means that they undergo changes over time as a function of learning). Nevertheless, ILs are natural systems, containing only rules, elements, and features that also exist in primary languages. Furthermore, the variability that characterizes ILs is highly systematic.

A much-documented characteristic of L2 phonological acquisition is the high degree of variability of the forms produced by individual learners at a single point in time. Native languages, too, contain variability; for example, the alternate use of the variants [θ] and [t] for American English /θ/ (Labov, 1969). However, ILs contain nontarget-like variants (e.g., [s] in addition to [θ] and [t] in German–English IL), and exhibit variation where the target system does not (e.g., the variants [z] and [s] for English /z/ in Swedish–English inter-phonology).

Although “erroneous” from a target-language perspective, however, these variable learner systems are not random; rather, contextual factors influence the systematicity of such variation. First, the *sociolinguistic setting* in terms of the formality of the speech situation (Beebe, 1980) or the nature of the language task (Dickerson, 1975) is one determinant. As a function of *style shifting* (Tarone, 1983), L2 speakers use different speech patterns depending on the social situation. The L2 learner's vernacular style mirrors the most systematic and most consistent and, therefore, “true” version of the IL, which actually makes the vernacular the more interesting variety to study. At the other end, formal styles appear least systematic, because of greater temporary intrusion of rules from the L1 and L2. This means that formal styles may be (temporarily) more “correct” in terms of a greater number of target-language forms, but, at the same time, (temporarily) more susceptible to L1 transfer (Beebe, 1980). It seems that formal styles reflect the learner's conscious, irregular, and insecure use of explicit phonological L1 and L2 competence, while vernacular styles reflect the unconscious and automatic workings of the most stable and implicit version of the IL system.

Another central factor governing IL variability is the linguistic context. Dickerson (1975) found that Japanese learners of English pronounced /z/ more accurately before vowels than before certain consonants or silence. Production was also more target-like word-initially than word-finally. Furthermore, Spanish learners of English or Swedish insert an epenthetic vowel before initial /s/-clusters (e.g., *spoon* → [ɛspu:n]) less often if the preceding word is vowel-final (e.g., *two spoons*) rather than consonant-final (e.g., *ten spoons*) (Carlisle, 1991; Abrahamsson, 1999). Similarly, Chinese learners of English or Swedish tend to either delete word-final consonants or add an epenthetic vowel (e.g., *dog* → [dɔ] or [dɔgə]) less often if the following word is vowel-initial (e.g., *dog is*) rather than consonant-initial

(e.g., *dog drinks*) (Abrahamsson, 2003a). The variable use of target versus nontarget forms in both these cases is governed by the possibility of resyllabifying individual members of consonant sequences by associating them with adjacent vowels. If the immediate context consists of other consonants, a new syllable is created by adding a vowel, or a consonant is simply deleted.

Unfortunately, longitudinal studies of inter-phonological development are rare. However, the few that exist on the ratio between errors and correct forms suggest that, rather than being linear, the developmental curve is U-shaped (Abrahamsson, 1999, 2003b). This means that the error rates may be quite low in the initial stages, and that they increase rather than decrease during the following phases of acquisition. Thereafter, a stable plateau phase with relatively high error rates may follow, after which error rates may decrease again. The initial increasing error versus target ratio can be explained as a function of increased speech rate, fluency, and the learner's emerging ability to focus on content rather than linguistic form, while the decreasing ratio at later stages can be interpreted as "real" acquisition, that is, the successive replacement of IL forms with target-language forms.

During periods of high error rates, however, the changing *internal* ratio between different nontarget-like forms indicates that the IL system is undergoing qualitative changes in the direction of target-language norms. These changes, where nontarget IL forms are replaced by other nontarget forms, or a (quantitatively defined) *preference* for one nontarget form is replaced by a higher preference for another nontarget form, should be viewed as "real" acquisition, too, as they can be described as sequential approximations to the target forms. In other words, target forms are approximated over time through universal developmental sequences. One such sequence is seen in the acquisition of final consonants. The three strategies (or processes) *consonant deletion*, *vowel epenthesis*, and *feature change* mentioned earlier always appear in that particular order before final consonants are pronounced in a target-like manner (Hammarberg, 1988; Hansen, 2001; Abrahamsson, 2003b); that is:

/dɔg/ *dog* → [dɔ] > [dɔgə] > [dɔk] > [dɔg]

This does not mean that every learner will stop at every stage, nor does it mean that the stages are discrete—some learners may pass through the sequence quickly with no or few overt manifestations of, for example, epenthesis, while others will use all IL forms (as well as the target form) simultaneously. In the latter case, only a frequency analysis over time will show that the preferences for different IL forms slowly shift in accordance with this developmental sequence (see, e.g., Abrahamsson, 2003b; see also Dickerson, 1975, for similar longitudinal effects in the acquisition of English /z/). Different learners may also spend different amounts of time at different stages—for example, a German learner of English may pass through the deletion and epenthesis stages rather quickly but get stuck at the feature-change stage because final devoicing is a phonetic process in German. The same sequence has been observed in L1 children, even though epenthesis seems quite rare in their development; however, *if* an epenthesis stage can be observed in a child's L1 development, it is always preceded by a deletion stage (Weinberger, 1994).

L1 Transfer and Crosslinguistic Influence

One crucial way in which L1 and L2 acquisition differ is that the latter is inevitably affected by one or several previously acquired languages. The degree and nature of this influence vary between linguistic levels: While morphosyntax is relatively unaffected by transfer from the L1, the developing L2 phonological system is heavily colored by the already established L1 phonology (which is why different foreign accents can be identified quite easily). According to the behaviorist view prevalent in the 1940s, 1950s, and 1960s, L1

4 PHONOLOGICAL ACQUISITION

structures, elements, and forms were automatically transferred into the L2, or, put differently, old habits interfered with the formation of new habits. According to the *contrastive analysis hypothesis* (CAH) (Lado, 1957), a comparison of a learner's L1 with the L2 would reveal the differences between the systems, and one would thus be able to predict the areas of difficulty: In areas where the two systems were identical or similar, any transferred forms would work (positive transfer, facilitation), while in areas where the two systems differed, the transferred forms would result in errors (negative transfer, interference). Furthermore, the greater the difference between the L1 and L2 systems, the greater the learning difficulty would be. Although intuitively and logically appealing, the CAH made many faulty predictions when tested against learner-language data, and it was eventually abandoned when it was discovered that IL development was governed primarily by factors other than interference from the L1 (see next section).

Moreover, current knowledge about transfer suggests that it operates to different degrees under different conditions. In contrast to what was implied by the CAH, interference seems to be most likely when, for example, an L2 phoneme and an L1 phoneme fulfill a similarity condition. Flege (1987) showed that English learners of L2 French had greater difficulties with French /u/ than with /y/ because English has a similar /u/ sound but no /y/ phoneme. In other words, it seems that *novel* sounds are easier to acquire than sounds with a *similar* (but not identical) equivalent in the L1.

Another condition on transfer is the degree of *speech formality* or *speech style*. While generally a classroom situation where the focus is on form generates fewer errors—including transfer errors—than a situation outside the school does, a formal situation may, in fact, generate specific L1 forms that would not surface under less formal conditions. Beebe (1980) observed that Thai learners of English used a high-prestige L1 variant of /ɪ/ in their English if the speech style was formal, but used more target-like variants when speaking in a less formal style.

Still another condition on transfer is the learner's current developmental level. Corder (1978) described the learner's system as a "restructuring continuum"; that is, the learner's point of departure is the L1 system, which is stepwise replaced by the L2 system. According to this view, one would expect transfer errors to be quite frequent at the initial stages but less frequent at more advanced stages in development, where developmental errors would instead dominate. In fact, this hypothesis is captured by Major's (1987) *ontogeny model* (Figure 1), according to which phonological transfer errors dominate at the beginning of

Figure 1 The ontogeny model (adapted from Major, 1987)

L2 acquisition but steadily decrease with time, while developmental errors are practically nonexistent at the early stages, but increase and then decrease with time.

Language Universals and Typological Markedness

As with L2 acquisition generally, L2 phonological acquisition shares many universal features and processes with L1 acquisition. L1 children, as well as adults learning an L2, delete consonants, insert epenthetic vowels, and devoice final voiced obstruents. Furthermore, both child and adult learners substitute certain sounds for others, for example /r/ → [l] or [j], and they unround front vowels, for example /y/ → [i]. On the other hand, some typical child language processes, such as reduplication of syllables (e.g., when *shoe* → [tutu] or *ball* → [bʌbʌ]), do not occur in adult L2 acquisition, while transfer processes, which characterize adult phonological learning, do not occur in monolingual L1 acquisition.

IL development in many ways mirrors the typological distributions, occurrences, and preferences of features in the world's languages. For example, one typological universal is that if a language has a voicing distinction for obstruents in word-final position, then that language also has this distinction in word-medial and word-initial position—there are no languages that make this distinction only word-finally. In other words, the existence of voiced obstruents word-finally *implies* voiced obstruents in all other positions, while the opposite is not true: There are many languages with a voicing distinction word-initially and word-medially that lack voicing in final position (e.g., German and Russian). Another implicational universal concerns syllable structure: A language that allows three-consonant (CCC) sequences word-finally also allows two-consonant (CC) clusters and single consonants (C) in that position. Thus, the existence of CCC implies the existence of CC, which in turn implies C, but the opposite implicational order is not true: There are many languages that allow only one final consonant but no clusters (e.g., Chinese and Spanish). These implicational relations can also be expressed in terms of *typological markedness* (Eckman, 1977), where voiced obstruents and three-consonant clusters in word-final position are relatively infrequent among the world's languages, and therefore are marked structures, while voiceless and singleton consonants word-finally are quite common and therefore unmarked. Markedness relations are reflected in both L1 and L2 acquisition: The voicing distinction is acquired first in word-initial (least marked) and last in word-final (most marked) positions (Eckman, 1977), and final singleton consonants (least marked) are mastered before two-consonant clusters (more marked), which are acquired before three-consonant clusters (most marked) (Hansen, 2001; Abrahamsson, 2003a).

One very specific phonological universal has to do with the degree of *sonority* of consonants. Acoustically, sonority can be defined as the degree of resonance of a speech sound, which in turn can be traced to its openness in terms of articulation. The *sonority hierarchy* (Figure 2a) refers to sound classes. Vowels are the most sonorous, since they are produced without obstruction of the airstream. Consonants, on the other hand, vary as to type and degree of obstruction, and therefore in sonority. *Semivowels* (such as the initial sounds of *well* and *yell*) are the most sonorous consonants, followed by *liquids* (e.g., /r, l/), *nasals* (e.g., /m, n, ŋ/), *fricatives* (e.g., /s, z, v, f, ʃ, ʒ, θ, ð/ and *stops* (e.g., /p, b, t, d, k, g, ʔ/).

Universally, syllables are organized according to the *sonority sequencing principle* (Figure 2b), which states that optimal syllables have onsets with consonants rising in sonority the closer their proximity to the nucleus (the vowel), and codas with consonants descending in sonority the greater their distance from the nucleus (Clements, 1990). This principle, producing syllables conforming to the *universal canonical syllable structure*, sanctions words like *print*, *snails*, and *blown* but prevents forms like **rpitn*, **nsaisl*, and **lbonw* from occurring. However, languages vary in faithfulness to principles of sonority. For example, English, Swedish,

Figure 2 (a) The sonority hierarchy; (b) the sonority sequencing principle or the universal canonical syllable structure

and many other European languages have onsets with /s/ + stop (*spit* and *street*), codas with stop + /s/ (*six* and *lips*), and onsets and codas with consonants of equal sonority (e.g., the Swedish nouns *svar* 'answer', *namn* 'name', *rufs* 'tousle', and *takt* 'beat'). Language acquisition, too, is constrained by sonority: Onsets or codas going against principles of sonority are more difficult to pronounce and to acquire than those obeying them (e.g., Carlisle, 1991; Abrahamsson, 2003a). However, just as primary languages sometimes ignore principles of sonority, so do ILs (see Abrahamsson, 1999, 2003a; Hancin-Bhatt, 2000).

Age of Acquisition and Ultimate Attainment of L2 Phonology

Young infants can discriminate a wide range of speech sounds representing contrasts in their native language and non-native contrasts. For instance, Werker, Gilbert, Humphrey, and Tees (1981) showed that 6- to 8-month-old infants from English-speaking environments perceived a Hindi consonant contrast in a native-like manner. However, the ability to discriminate phonemic contrasts not belonging to the native language declines after 6 months and disappears by 12 months. That is, after one year, infants have already tuned in to the phonetic distinctions in their L1, and are insensitive to contrasts not present in their immediate linguistic environment (e.g., Werker & Lalonde, 1988).

Most children who acquire an L2 in a naturalistic context do so relatively quickly and easily. Typically, at adulthood, their ultimate attainment—especially in terms of phonology and pronunciation—is indistinguishable from that of native speakers. The majority of adult L2 learners, on the other hand, progress relatively slowly (except in absolute initial stages), and they often need formal teaching in order to develop to any significant extent. Most importantly, their ultimate attainment is far from that of L2 children or native speakers, not least in the area of pronunciation; in fact, all adult learners will retain *some* degree of foreign accent.

A strong correlation between *age of onset* of L2 acquisition (often operationalized as the age of immigration) and *ultimate attainment* has been observed in all studies of age effects in pronunciation (e.g., Asher & García, 1969; Flege, 1999; Munro & Mann, 2005). The robustness of these results has led some researchers to assume the existence of maturational constraints on language acquisition, usually in the form of a *critical period* (CP) during which language acquisition must take place in order for native-like pronunciation to develop. Some have even suggested that, because of the physical basis for speech, a CP should exist only for pronunciation but not for higher-order language components such

as grammar or lexis (e.g., Scovel, 1988). Others have proposed multiple CPs with different time schedules, of which one (or several) would be relevant for (different parts of) phonology, while others would be associated with (different aspects of) morphology, syntax, and the lexicon. Still other researchers point to the existence of a few extraordinary learners who, despite having begun acquisition after the closure of the proposed CP (i.e., even as adults), have attained a seemingly native-like command of the L2, including their pronunciation. These researchers conclude *either* that there is no CP for language acquisition *or* that there are individual factors (extensive exposure or training, extraordinary motivation or talent, etc.) that may compensate for the biological disadvantage of a late start (for an overview, see Bongaerts, 1999).

Final Remarks

The acquisition of phonology is very much like a miniature version of language acquisition in general, and when telling the story of (inter-)phonological development, one will naturally cover the most typical and most important factors of (inter)language development. As shown here, many central issues of general (second) language acquisition research, such as variability, systematicity, developmental sequences, crosslinguistic influence, typological markedness, age of onset, and the critical period, can be illustrated easily with phonological examples, and the list could be extended to cover social circumstances, cognitive processing and other individual differences (e.g., language aptitude). However, an entry of this kind cannot be exhaustive; the focus here was therefore on issues shared by other L2 acquisition areas and—for the most part—by L1 acquisition. As a result, many important questions concerning the acquisition of *second* language phonology have not been addressed. For example, the influence of (L1 and L2) orthography on L2 phonological development has been excluded (see Bassetti, 2008), as has the entire area of intelligibility and comprehensibility of foreign accents (see, e.g., Munro, 2008). Similarly, any pedagogical implications or discussions on teaching pronunciation must be found elsewhere (see, e.g., Bradlow, 2008; Derwing, 2008).

Phonological Analysis

ROY C. MAJOR

Phonology is the study of how speech sounds function as a system, and phonological analysis involves analyzing the sound systems of languages. A variety of approaches to the study of phonology have been developed, but one matter on which linguists agree is that phonological analysis requires a way of representing speech sounds on the page—a set of phonetic symbols that are always used in the same way. To distinguish these from standard spelling, square brackets [] are used around a *phonetic transcription*, that is, the symbols representing speech sounds. Spelling and other orthographic representations of words are often irrelevant to phonology. For example, *laugh* and *calf* end with the sound [f], even though the last parts of the words are spelled differently. Likewise, *won* and *one* are pronounced identically but are spelled differently, and both words begin with [w]. Different languages have different inventories of sounds. Furthermore, some of the same sounds function differently in different languages. English *day* and *they* contrast in the initial consonant sounds [d] and [ð], and a native speaker (NS) of English thinks of them as different sounds. Mandarin, however, has [d] but no [ð]. Spanish has both sounds, but they function differently from English. The *d* in *día* ‘day’ is pronounced [d] when it begins an utterance, but when *d* follows a vowel it is pronounced [ð] as in *nada* ‘nothing’ and *cinco días* ‘five days’. In contrast to an English NS, an NS of Spanish thinks of them as the same sound because they function as one unit called a phoneme.

A *phoneme* is the minimal unit of sound that can be used to distinguish meaning. *Allophones* are the various ways a phoneme is pronounced, the subunits of a phoneme. Phonemes are represented in slashes / / and allophones in square brackets []. Phonemes themselves are not sounds; rather they are abstract units. Allophones, however, are the phonetic realizations of the phoneme. In other words, phonemes are in the mind and allophones are what we actually hear. The phonetic symbol for the phoneme is always also the phonetic symbol for one of its allophones. For example, English /d/ has [d] as one of its allophones. In the English and Spanish examples above, English has two separate phonemes /d/ and /ð/ with the allophones [d] and [ð] respectively, while Spanish has one phoneme /d/ with two allophones [d] and [ð].

Three Ways to Find Phonemes and Allophones of a Language

Phonological analysis involves describing the rules governing pronunciation in a language. This includes finding the phonemes and distinguishing between phonemes and allophones. The first step is to look for a *minimal pair*: two words with different meanings that are identical phonetically except for one sound and with the sounds in the same order. For example, English *cap* and *cab* form a minimal pair. The existence of a minimal pair indicates that the two sounds in question, [p] and [b], are separate phonemes /p/ and /b/ because interchanging [p] and [b] changes the meaning of the word.

A second way to evaluate relationships among sounds is to look for instances of free variation. If two or more sounds freely vary and never contrast (i.e., there is no minimal pair) they are allophones of one phoneme, not separate phonemes. Variation occurs within

every language. An English speaker pronouncing the word *sit* may choose not to emphasize the final /t/ and simply produce it as [t]. However, the same speaker, when giving a forceful command to a dog to 'sit', may release the /t/, giving it a puff of air called aspiration, [t^h]. These two sounds [t] and [t^h] are in free variation—they never contrast, and the substitution of one for the other never makes a difference in the basic meaning of the verb *sit*. Of course there may be stylistic and emotional differences between these two versions, but the verb still has the same meaning. In this example, /t/ is the phoneme with allophones [t] and [t^h]. Free variation is distinguished from a minimal pair because with minimal pairs a change from one sound to another can potentially make a meaning difference: Switching the final [t] or [t^h] to [d] would change the meaning of *sit* into *Sid*, and, because of this, /t/ and /d/ are separate phonemes. Because different languages have different sound systems, in one language two sounds may be in free variation and allophones of one phoneme, while in another language the same two sounds may be separate phonemes because of the existence of a minimal pair. In English [t] and [t^h] are allophones of the same phoneme /t/, but in Hindi they are separate phonemes /t/ and /t^h/ because they contrast: [sat] means 'seven' and [sat^h] means 'company'.

The third way to determine phonological relationships is by looking for instances of *complementary distribution*, which occurs when two or more similar sounds are never found in the same phonetic environment and never contrast (i.e., there is no minimal pair). The existence of complementary distribution indicates that these sounds are allophones of one phoneme, not separate phonemes. To demonstrate such a relationship, place the palm of your hand in front of your mouth and then pronounce *pill* and then *spill*. If you are an NS of English you will feel much more air expelled with *pill* than with *spill*. The /p/ in *spill* is [p], while the /p/ in *pill* is aspirated [p^h]. Now try to make *pill* with an unaspirated [p] and *spill* with an aspirated [p^h]. If you are able to do so, the words will sound odd or at least non-native. In English, [p] and [p^h] are in complementary distribution and therefore allophones of the same phoneme /p/ (additionally there are no minimal pairs for these two sounds). Specifically, [p] and [p^h] are never found in the same phonetic environment: [p^h] always occurs at the beginning of a stressed syllable (including a one-syllable word) and [p] never occurs there; [p] occurs after [s] in the same syllable. Contrast *this pill* with *this spill*. Although in both pairs /p/ occurs after [s], in *this pill* the [s] is part of the previous syllable; therefore, the /p/ is aspirated [p^h].

One can conceptualize complementary distribution as an always/never situation: [x] always occurs in a specific environment and [y] never occurs there. To make an analogy, a chameleon changes color. On a brown leaf it turns brown but on a green leaf it turns green. It is still the same chameleon, even though it changes color. We can think of the neutral chameleon as the phoneme and the brown and green versions as its allophones.

Although an NS may not be able to identify all the phonemes of his or her language, linguists have long known that phonemes have psychological reality (Sapir, 1949). For example, an English speaker is very aware that /p/ and /b/ are different sounds, as well as /r/ and /l/. On the other hand, NSs are usually completely unaware of the allophones (be they in free variation or complementary distribution). In the NS's mind, all of the allophones of a given phoneme are conceptualized as a single sound. For instance, some speakers of Japanese and Korean cannot hear the difference between English /r/ and /l/ because their languages have one phoneme for these two sounds and do not distinguish between the two—they are allophones of the same phoneme and to some speakers *fry* and *fly* sound the same. To an NS of English the *ps* in *pill* and *spill* are the same sound (see example above) and the *ns* in *pin* and *pinch* are the same. In the latter example, the two *ns* are actually different phonetically. To demonstrate this, first pronounce *pin* and elongate the *n* sound. Next pronounce *pinch* and also prolong the *n* before you pronounce

the *ch*. When pronouncing *pin* you can feel the tongue tip touching behind the teeth but with *pinch* the blade of the tongue touches the hard palate. These two different sounds [ɲ] and [ɲ] respectively) are in complementary distribution and are therefore allophones of one phoneme /n/: [ɲ] occurs before a *ch* sound or *j* sound (as in *grinch* and *cringe*) and [n] elsewhere.

Phonological Rules

Another way of conceptualizing the relationship between phonemes and allophones is in terms of *phonological rules* (also called phonological processes), which is a more economical way of stating complementary distribution and free variation. Instead of stating allophonic distribution in terms of “occurs,” an arrow $\rightarrow$ replaces “occurs,” the arrow signifying “becomes” or “is realized as.” In the case of *pinch* described earlier, /n/ becomes [ɲ] before a *ch* sound or *j* sound. To capture this process, we can write the phonological rule as follows:

/n/ $\rightarrow$ [ɲ] before [tʃ] and [dʒ]

Using shorthand notation this rule can be further abbreviated as:

/n/ $\rightarrow$ [ɲ]/___[tʃ dʒ]

To take another example from English: When a nasal consonant occurs in coda position (after a vowel in the same syllable) the vowel is nasalized, as in *loom*, *own*, *king*: [lū̃m], [ō̃n], [kī̃ŋ]. When the nasal begins a syllable (called an *onset* consonant) the vowel is not nasalized, as in *no* [no], not *[nō̃]. Contrast *see no* with *scene O*: [sino] [sī̃no]. This English rule can be stated as follows:

Vowel $\rightarrow$ [+nas]/___C
 $\left\{ \begin{array}{l} \text{[coda]} \\ \text{[+nas]} \end{array} \right\}$

Distinctive Features

Different languages differ in terms of what features function to contrast meaning. A common feature in many languages is [voice]. The vocal chords vibrate in a *voiced* sound but they do not in a *voiceless* sound. To feel this difference make an *s* sound [s] while placing your hand on your Adam’s apple (voice box or larynx) and then do the same for a *z* sound [z]. You should feel the vibration for the voiced [z], but not for the voiceless [s]. In English the pairs *cap/cab*, *ice/eyes*, *hit/hid* all contrast in the last sounds; [p s t] are *voiceless* sounds and [b z d] are *voiced* sounds. Thus, in English the feature [voice] is a *distinctive feature*. For the pair *hit/hiss*, the relevant distinctive feature is [continuant]. (The air flow continues when pronouncing the [s] in *hiss* but it stops when making the [t] in *hit*.)

Larger Units: Prosody

Prosody, also called suprasegmentals, includes units larger than the segment, such as *stress*, *intonation*, *tone*, and *rhythm and timing*. These aspects of speech occur simultaneously with vowels and consonants and may stretch across syllables, words, and larger units.

4 PHONOLOGICAL ANALYSIS

Stress is contrastive in many languages, such as English, meaning that changing the stress from one syllable to another can change meaning. For example, *differ* and *defer* contrast in stress placement. In *differ* stress falls on the first syllable, while in *defer*, it occurs on the second. French, however, has no contrastive stress. Yet, when hearing French, speakers of languages having contrastive stress often hear stress on the last syllable, even though it is not contrastive in native French.

Intonation is the change in pitch over an utterance or phrase, which can signal differences in meaning. In English a rising intonation at the end of an utterance usually indicates a yes/no question (*do you like coffee?* or *you like coffee?*) and a rising/falling intonation typically represents a simple declarative statement (*I like coffee*). In a language such as English that employs intonation to convey meaning, changes in pitch patterns usually manifest themselves over several syllables; yet, as long as the basic pattern holds, any slight changes in pitch on different syllables will not change the meaning. For example, in *you like coffee?* a rising intonation signals a question regardless of whether the pitch rise is on the first or second syllable of *coffee*.

A quite different use of pitch occurs in many languages, where a change in pitch on one syllable can make a difference in meaning. These are called *tone languages*, and they include all Chinese dialects, Thai, Vietnamese, and most African languages, including the Bantu languages. In Mandarin Chinese (standard Chinese), the syllable /ma/ has four meanings depending on its tone:

[ma]	high level	'mother'
[ma]	high rising	'hemp'
[ma]	low falling-rising	'horse'
[ma]	high-falling	'scold'

Norwegian distinguishes tone over two syllables:

[bønɪɾ]	step up tone	'peasants'
[bønɪɾ]	step down tone	'beans'

Analyzing prosodic characteristics is similar to looking for minimal pairs (or in the case of Mandarin, minimal quadruplets), where one minimal difference makes a difference in meaning.

The rhythm of languages also differs. In a *syllable-timed* language, such as Spanish, syllables are perceived as relatively equal in length regardless of stress, whereas in a *stress-timed* language, such as English, the stressed syllables are perceived as much longer than the unstressed syllables. Compare for example, an NS of Spanish's pronunciation of *la casa es bonita* 'The house is beautiful' with an NS of English's *the house is beautiful* and to an NS of Brazilian Portuguese's *a casa é bonita* (Portuguese is a stress-timed language; Major, 1981). In native English and Portuguese the stressed syllables sound much longer than in native Spanish. Furthermore in a stress-timed language the unstressed syllables tend to be shortened and even deleted. For example, *comfortable* and *temperature* are normally reduced from four syllables to three.

Phonological Analysis of Foreign Accent

Analyzing the phonology of a non-native speaker (NNS) is very similar to analyzing the phonology of an NS in both its objectives and procedures. Before discussing procedures for analyzing foreign accent, some preliminaries are in order concerning the source of

non-native productions of speech sounds. For an NNS there are two main linguistic sources of non-native substitutions: *first language transfer* (interference) and *universals* (Major, 2001). First language (L1) transfer occurs when the phonology of the L1 operates when speaking the second or foreign language. ("Foreign language" and "second language" [L2] will be used synonymously, regardless of whether the language is the second, third, fourth, or *n*th language.) For example, NSs of English may use English [r] when trying to pronounce French and German *rs* (which are very different) and an aspirated [t^h] when pronouncing French *t*, (which is unaspirated).

In contrast, sometimes the sounds the NNS produces are not due to his or her native language, although still different from an NS's pronunciation. These types of substitutions are called *universal substitutions*—they do not occur in adult NSs of either language. They are called universal because they are common substitutions children make when acquiring that language as an L1; furthermore, they occur in adult L2 learners, regardless of their L1s. Universals in L2 acquisition were documented as early as 1971 when Nemser found Hungarian learners pronouncing the English *th* ([θ]) as the sequence *sth* ([sθ]), which does not occur in either Hungarian or English. Altenberg and Vago (1983) also described substitutions due to universals in Hungarian learners of English. Major (1986) found that, when speaking Spanish, NSs of American English used an *r* that was neither native Spanish nor English but similar to a French or German *r*, even though none of the speakers had studied French or German.

Let us now consider several examples of specific features of foreign accents and how they can be analyzed. German does not distinguish between the vowel sounds in English *bet* and *bat*, the German vowel sound being closer to the sound in *bet*. A German speaker might pronounce English *bat* as *bet*, a simple case of transfer: substituting the German phoneme that is nearest to the English phoneme. Another example of transfer from German concerns syllables ending in /b/, /d/, or /g/, which in native German are pronounced as [p], [t], and [k] (*Hund* /hund/: [hunt] 'dog' but *Hunde* /hunde/: [hundə] 'dogs'). When this rule is transferred to a speaker's English the words *Bob*, *bed*, and *tog* may sound like *bop*, *bet*, and *tock*.

In contrast, now consider an NS of Japanese pronouncing these same words. In Japanese, all words end with vowels, the only exception being /n/ (e.g., *Nippon* 'Japan'). When pronouncing these English words above, Japanese speakers often insert vowels, resulting in *Bob*[u], *bed*[o], and *tog*[u], also a case of L1 transfer (e.g., the loanword *Big Mac* in Japanese is [bigumaku]). More advanced learners may overcome this tendency to insert vowels, but instead of pronouncing these words with final [b d g], they may pronounce them with final [p t k] as a German speaker would, even though Japanese has both /b d g/ and /p t k/. In the case of the German speaker the substitutions are due to transfer, but for the Japanese speaker, transfer cannot explain the substitutions because in native Japanese there is no rule changing [b d g] → [p t k] in final position, and in fact, none of these sounds occurs in this position. The Japanese substitutions are due to universals—substitutions that are not due to L1 transfer. They are truly universal because the same substitutions occur in other L2 learners of English with different L1s and are legion in children learning English as an L1. Furthermore, this rule, called *terminal obstruent devoicing*, is common in many languages of the world (e.g., Armenian, German, Maltese, Russian, and Turkish).

All L2 substitutions can be stated in terms of rules, regardless of whether the substitutions are caused by transfer or universals. As seen in the following examples, the rules are stated in the same manner we have employed for NSs regarding phonemes and allophones:

1. A Spanish speaker uses a *ch* sound ([tʃ]) for both English *sh* and *ch* sounds (/ʃ/ and /tʃ/): *chew* and *shoe*: [tʃu]

- /tʃ ʃ/ → [tʃ]
2. An Arabic speaker pronounces *luck*, *lock*, and *lack* identically: [lak]
/æ a ʌ/ → [a]
 3. Italian, Japanese, and Russian speakers of English produce [p t k] for final [b d g]: *Bob*,
hid, *pig* → [bap] [hut] [pɪk]
/b d g/ → [-voice]/___#
 4. A Brazilian Portuguese speaker of English inserts the vowel [i] after certain coda
(syllable-final) consonants: *picnic* → [pikiniki]:
Ø → [i]/C___ (Ø → [i] = [i] is inserted).
[coda]

Implications for Teaching Pronunciation of a Second Language

Teaching pronunciation involves anticipating and analyzing language learners' problems and designing materials and methodologies accordingly. An important step in competent teaching is to identify not only the phenomena causing difficulties but more importantly the details of each problem, that is, the specific phonetic environments where the problems occur. It may be quite easy to spot students who are having difficulty with /r/ and /l/ but more difficult to identify the environments causing problems. In such a case, the following questions should be asked: Is there equal difficulty with both sounds? Is there equal difficulty when words begin and end with /r/ and/or /l/? What about their occurrence in consonant clusters versus in isolation (*fry/fly* vs. *rye/lie*)? Are the sounds preceding and following the /r/ different from the sounds preceding and following the /l/? (In some languages of Africa and Asia [r] and [l] are in complementary distribution: In Ganda [l] occurs after /u o a/ and [r] occurs after /i e/.)

When we hear a foreign accent, we notice patterns that are different from those of an NS but usually we do not notice things that are the same. This is analogous to hearing another NS speaking a different dialect. New York English is often called an r-less dialect. Speakers with an r-full dialect often notice the lack of /r/ in *park the car* but they do not notice the presence of /r/s at all in the utterance *car is red* because /r/ is pronounced before a vowel in all dialects of English. Suppose that a pronunciation teacher notices some difficulties with /r/ and /l/ but fails to notice that students have no difficulty in initial position (e.g., *lay*, *ray*), even though they do have difficulty pronouncing /r/ and /l/ after consonants (e.g. *play*, *pray*). It would then be a complete waste of time practicing /r/ and /l/ in initial position. Thus, doing a phonological analysis of the speakers' L2 phonology is absolutely essential in teaching pronunciation.

Conclusion

There is no single agreed-upon approach in doing phonological analysis. Although rules to describe patterns in languages (in syntax, morphology, and phonology) have been employed for more than 2,000 years (in the fourth century BC Panini postulated nearly 4,000 rules for Sanskrit), optimality theory (Prince & Smolensky, 1993; 1997) does away with rules and replaces them with the *universal constraints*. Thus, a rule that deletes final consonants could be stated as a constraint: No final consonants are allowed in this language (Hawaiian is a classic example). However, regardless of the approach, probably all phonologists would agree that the goal of phonological analysis is to describe the sound patterns of the languages of the world and to discover universals of language.

Phonetics and Phonology: Historical Overview

ADAM BROWN

Terminology

At the outset, it is necessary to clarify the terms *phonetics* and *phonology*, and to distinguish them from two other confusable terms: *pronunciation* and *phonics*.

Phonetics is the scientific study of all aspects of the spoken form of language. Phonetics is thus scientific (objective, data-based, unbiased, dispassionate) and not subjective or biased. It describes the spoken form, in contrast to the written form, although many people's reactions to features of speech are heavily influenced by spelling. It covers all aspects of the spoken form: articulatory (the way sounds are formed by the lungs, mouth, and nose), acoustic (the properties of the sound waves created), and auditory phonetics (how the sound waves are interpreted by the listener's brain). Notice also that the definition uses the word *language* rather than *languages* or *a language*. By *language*, we mean the human ability to communicate, which underlies all human languages. Although much of phonetics has historically been concerned with English, the study of the sounds of an "exotic" language, spoken by only a few speakers, or one that has no writing system, is equally valid. So, a phonetic statement would say, for example, that an [l] sound involves the tip of the tongue touching the alveolar ridge (behind the upper teeth) in the centre of the mouth, and air escaping over the sides of the tongue, while the vocal cords vibrate.

Phonology is the scientific study of how sounds occur, function, and combine in particular languages. For instance, the [l] sound occurs in English and Thai, but not in Māori. While both English and Thai have the [l] sound, they function differently: English [l] can occur at both the beginning and end of syllables, for example *loop*, *pool*, but in Thai [l] can only occur syllable-initially, for example [lom] 'air', and not syllable-finally. One pattern for two-consonant syllable-initial consonant clusters in English is [p, b, t, d, k, g] followed by [l, r, w, j]; however, while [pl, bl, kl, gl] all occur, for example *play*, *blow*, *clap*, *glue*, [tl] and [dl] do not occur. Phonology is thus language-specific, and describes how sounds pattern in particular languages.

Pronunciation is the more practical activity of teaching the sounds of a new language. *Phonics* is the system of using sound-spelling correspondences to help learners read and write a language.

Pre-19th-Century Phonetics

Although this article outlines the development of phonetics and phonology in the 19th and 20th centuries, it is important to point out briefly that phonetic and phonological study predates this, in languages that have a much longer history than English (Moses, 1964). Two examples of early phoneticians are enough to make the point. While these two are the most famous, it is clear from their writings that they were building on the work of previous, lesser-known analysts.

2 PHONETICS AND PHONOLOGY: HISTORICAL OVERVIEW

Panini (probably fifth century BC) analyzed the grammar of Sanskrit, the classical literary language of India, and distinguished the language of sacred texts from that of everyday communication. His analysis used about 1,700 elements (including grammatical categories such as noun and verb, and phonetic categories such as vowel and consonant) and about 4,000 rules for explaining the phonological, grammatical, and morphological structure of Sanskrit (Deshpande, 1997).

Al-Khalil Abu 'Amr Al-Farahidi wrote an Arabic dictionary in the seventh century. While dictionaries had been compiled before him, they had been arranged by content. Al-Khalil's dictionary was arranged in phonological order of initial sounds, from the larynx to the lips. In its introduction, he discussed the phonetic and phonological system of Arabic. Over the next four centuries, study of Arabic phonetics, phonology, and grammar continued, some carried out by students of Al-Khalil, and often driven by the desire to pronounce the Quran correctly (Rosenhouse, 2007).

Phonetics and Phonology in the 19th Century

Two major figures in 19th-century phonetics and phonology were coincidentally born in the same year: Jan Baudouin de Courtenay (1845–1929) and Henry Sweet (1845–1912). As was common at the time, both came from a scholarly background in historical linguistics (philology).

De Courtenay was Polish and received his doctorate with a thesis on pre-14th-century Old Polish. However, he is best known for his work on the concept of the phoneme (Moses, 1964). The modern position is that the phoneme is an abstract unit of a language (e.g., English phonemic /s/) that consists of sounds that (a) are phonetically similar (i.e., are produced in similar ways) and (b) function in predictable, non-overlapping environments. For example, the [s] sounds at the beginning of the English words *see*, *sue*, and *saw* are slightly different, but this difference can be predicted from the environment (in this case, the nature of the following vowel sound). These three [s] sounds, or allophones, belong to the same /s/ unit, or phoneme.

Henry Sweet was born in London and studied at Oxford University. He excelled at Old English and Old Norse, the language of the Vikings. In his books *A Handbook of Phonetics* (1877) and *A Primer of Spoken English* (1890), he described educated London speech and produced a notation system for English sounds. His emphasis on spoken language established his place in the field of language teaching.

Phonetics and Phonology in the 20th Century

The same two factors were influential through the following century: the analysis of sounds into units, especially the phoneme, and the transcription of sounds.

The term *phoneme* was coined in 1873 by the French linguist A. Dufriche-Desgenettes (1804–78). The concept was analyzed and expanded by many linguists, including de Courtenay and his student Mikołaj Kruszewski (1851–87) in the Kazan school (Albrow, 1981), Henry Sweet, and Ferdinand de Saussure (1857–1913). However, it is Daniel Jones (1881–1967) who did most to establish the interpretation of the phoneme widely accepted today (Jones, 1950). Jones studied for one year (1905–6) under Paul Passy (see below), and married Passy's niece. He also briefly took private lessons from Henry Sweet. His association with University College London (UCL) lasted from 1907 until his retirement in 1949. His students included A. C. Gimson, who succeeded him as Professor of Phonetics at UCL in 1966 and wrote the standard textbook on British English phonetics, *Introduction*

to the *Pronunciation of English* (first edition 1962; current edition entitled *Gimson's Pronunciation of English*, Cruttenden, 2008), and David Abercrombie (1909–92), who established the Department of Phonetics at the University of Edinburgh. Among Gimson's students was John (J. C.) Wells (b. 1939), author of the *Longman Pronunciation Dictionary* (2008), who succeeded him as Professor of Phonetics at UCL. Among Abercrombie's students was Peter Ladefoged (1925–2006), author of *A Course in Phonetics* (2006) and Professor of Phonetics at the University of California, Los Angeles.

Jones is also famous for the system of cardinal vowels, that is, reference vowel sounds that can be produced by all humans with normal physiology. These language-independent vowel sounds can be used as articulatory points by reference to which actual vowel sounds in languages can be described.

Among Jones's contemporaries at UCL was J. R. Firth (1890–1960), whose prosodic analysis (Hill, 1966) emphasized that certain sound features are not associated with individual vowel and consonant segments, but are properties of larger units such as syllables, words, and intonation groups. This was already acknowledged for features such as tone, intonation, and stress (often nowadays called suprasegmental), but Firth extended this to *coarticulation* (the fact that the phonetic properties of particular segments affect surrounding sounds, so that no moment in an utterance only represents the properties of the segment being pronounced at that moment). This point of view derives partly from the development of instrumental techniques, which clearly show such coarticulatory phenomena.

An even larger-scale perspective was investigated by John Laver (b. 1938), another student of Abercrombie. In his 1980 book *The Phonetic Description of Voice Quality*, he analyzed the longer-term articulatory settings of the vocal organs, which affect all susceptible vowel and consonant segments, and give rise to qualities characteristic of different languages, individual speakers, their geographical or social accents, or shorter-term attitudinal states.

Instrumental Phonetics

Ohala (1991) distinguishes between taxonomic phonetics and scientific phonetics. The first deals with naming and classifying speech sounds, and transcribing them. The latter “seeks to understand how speech works at all levels from the brain of the speaker to the brain of the hearer. . . . This is where theories are formulated, statistical analysis of results performed as well as controlled observations, calibrations and all the other characteristics of traditional scientific procedures. This is what one finds presented at phonetics conferences and congresses and in the phonetics journals; it is where most of the ‘action’ is” (pp. 133–4). Four principal methods of instrumental phonetics (Ladefoged, 2003) will be briefly described.

Palatography has a long history (Moses, 1964). In its most common form the roof of the mouth is sprayed with a dark powder, which is removed by contact with the tongue, the resultant pattern being photographed. A more modern method is to insert an artificial palate inlaid with electrodes to record tongue contact continuously.

An electroaerometer records the airflow from the mouth and nose, using a mask with separate sensing devices worn by the speaker. The results can be printed as line traces on an ink printer (mingograph).

A spectrogram is a three-dimensional printout of the acoustic properties of the speech signal: time (horizontal), frequency (vertical), and intensity (darkness of the trace). Spectrographs were originally invented by Bell Laboratories in the USA, and early models were dedicated machines burning the trace on special paper. Nowadays, many analysts use the freely downloadable Praat computer program (Praat, *n.d.*).

While spectrography analyzes speech into its acoustic properties, speech synthesis does the opposite by using the acoustic properties of sounds to create speech electronically. Earlier mechanical spectrographs date back to Wolfgang von Kempelen (1723–95).

The International Phonetic Association and Alphabet

The use of symbols to transcribe sounds has preoccupied phoneticians for decades, and many of the personalities cited above (Sweet, Jones, Gimson, Abercrombie, Ladefoged) have contributed significantly to the field of phonetic transcription.

An early attempt to represent speech in symbols was made by Alexander Melville Bell (1819–1905), who taught phonetics at UCL assisted by his son Alexander Graham Bell, a student at the college and future inventor of the telephone. However, toward the end of the 19th century, a small group of teachers of various European languages gathered, under the leadership of the Frenchman Paul Passy (1859–1940) and the Dane Otto Jespersen (1860–1943). Its purpose was to devise a system of phonetic symbols to help schoolchildren acquire the pronunciation of foreign languages, primarily English, French, and German, and also to help in the teaching of reading. Originally called *Dhi Fonètik Ticerz' Asóciécon* (The Phonetic Teachers' Association), itself a development of *L'Association Phonétique des Professeurs d'Anglais* (The Phonetic Association of English Teachers), in 1897 it became the International Phonetic Association (IPA) (McMahon, 1986). With an initial membership of just 11 in France, it grew within one year to 58 in 12 countries. By 1914, this had grown to 1,751 in 40 countries.

It was Jespersen who first suggested that there should be an International Phonetic Alphabet (also IPA) which was not language-specific, rather than transcription systems specific to particular languages. The IPA was based on the Romic (Roman alphabet-based) system of Henry Sweet. The principles underlying the IPA were stated in 1888 (also see *Handbook of the International Phonetic Association*, 1999, Appendix 1):

1. Each sign should have its own distinctive sound.
2. The same sign should be used for the same sound across all languages.
3. As many ordinary roman letters as possible should be used, and the usage of new letters should be minimal.
4. International usage should decide the sound of each sign.
5. The look of the new letters should suggest the sound that they represent.
6. Diacritics should be avoided when possible, as they are difficult to write and hard to see.

The most recent major revision of the IPA took place in Kiel, Germany in 1989, although there have been subsequent minor changes.

It should be pointed out that the IPA is a *phonetic* alphabet, that is, a set of symbols for transcribing humanly possible sounds regardless of the languages they occur in. A set of symbols to represent the phonemes of English is necessitated by the poor sound–spelling correspondence of English spelling. Attempts to regularize English spelling have been made for centuries. A famous proponent of spelling reform was George Bernard Shaw (1856–1950), author of the play *Pygmalion*, later made into the musical *My Fair Lady*; it is not certain whether the character of Professor Henry Higgins was based on Henry Sweet or Daniel Jones (Collins & Mees, 1998).

The most widely used phonemic alphabet for British English (as used, for instance, in dictionaries) is that proposed by Gimson in the 14th edition (1977) of the *English Pronouncing Dictionary* (sometimes referred to as Gimson transcription or EPD14 transcription).

While the IPA is the most widely used system of phonetic symbols, other systems exist. Some Americans use the American Phonetic Alphabet (APA) which was originally developed for the transcription of Native American languages. Its main difference from the IPA lies in the use of diacritics. For example, while the IPA uses [ʃ] for the initial sound of *ship*, the APA uses [š]. The APA was thus easier than the IPA to produce on a typewriter, for instance when carrying out fieldwork.

Computer-readable alphabets include ARPABET (Advanced Research Projects Agency alphabet) for American English, and SAMPA (Speech Assessment Methods Phonetic Alphabet) and Kirshenbaum for the whole IPA.

SIL International

SIL International (formerly called the Summer Institute of Linguistics) is a US-based organization that has carried out important research, analyzing and documenting minority languages of the Americas, many of which had no previous writing system. As a partner organization of Wycliffe Bible Translators, SIL is a Protestant missionary organization whose purpose is to translate the Bible into minority languages.

Since many of these minority languages had no writing system, SIL needed to devise writing systems for the languages in order to be able to translate the Bible. It therefore ran courses that trained participants in the principles of analyzing languages with a view to producing essentially phoneme-based writing systems for them. The first of these was conducted in 1934 by SIL's founder, William Cameron Townsend (1896–1982). A student on the second course, in the following year, was Kenneth Lee Pike (1912–2000), who went on to become the president of SIL (1942–79), and taught at the University of Michigan (1942–77), eventually becoming Professor of Linguistics (Pike, 1981). To illustrate the principle of analyzing an unknown language, Pike became famous for his practical demonstrations. Using objects and gestures, he elicited spoken examples from a native speaker of an unknown language and, within a short space of time, derived the main features of the language's sound and grammar systems, and vocabulary items.

Because its researchers have worked on many languages around the world, SIL has published *Ethnologue* (Lewis, 2009), a catalogue of the world's languages. The current 16th edition lists 6,909 languages, of which SIL claims to have studied more than 2,550 over the last 75 years.

Phonology

The most influential work on phonology in the last half century was *The Sound Pattern of English* (SPE; Chomsky & Halle, 1968). Vowel and consonant segments were no longer thought of as indivisible segments, but as combinations of binary distinctive features such as [$\pm$ voice] (plus or minus voice), that is, voiced or voiceless (with or without vocal cord vibration). Similar features had been proposed by Jakobson, Fant, & Halle (1952). At least two levels of representation were proposed. The underlying representation was an abstract level, which was transformed by ordered rules that worked on these features to give the surface representation, the actual pronunciation. This transformation from the synchronic (point in time) perspective often mirrored the diachronic (through time, historical) change that gave rise to it.

SPE has spawned various other phonological theories, with different degrees of abstractness. Some of these can be seen as relating to Chomsky's later views on grammar. Natural phonology (Stampe, 1979) proposes that, while phonological processes are universal, whether particular processes apply is language-specific. Autosegmental phonology (Goldsmith,

1990) posits that phonological phenomena involve sequences of features on multiple tiers. In optimality theory (OT; Prince & Smolensky, 2004), different languages select surface representations that best satisfy ordered constraints; as one writer put it, the production-line metaphor of SPE (producing surface forms from underlying representations) has given way to the metaphor of a job interview panel for OT (selecting from a range of surface forms). A succinct description of a number of post-SPE developments is given by Householder (1979).

Phonologists have proposed theories in order to model different phenomena: the historical developments from former pronunciations; the connection with spelling; child language acquisition of sounds; where phonological representations are stored in the brain; and phonological disorders. Many of these theories have been quite abstract and, as a result, have been criticized as being of little practical value to applied linguistics and in particular to the classroom activities of language teachers. In short, most applied linguists go little beyond the taxonomic phonemic analysis of Jones, Gimson, and others when discussing sound systems. As Abercrombie (1985, p. 23) explained:

Jones always said that there was no such thing as phonology as a subject separate from phonetics (he never used the word phonetics). His phoneme concept was unpretentious and unadventurous. Its purpose was to be of service to applied phonetics, especially the making of transcriptions for language teaching.

Phonology: Mixed Methods

TALIA ISAACS

Background

A growing number of researchers in the area of second language phonology have employed a mixed methods approach to better understand the research problem and to strengthen the quality of their inferences or interpretations (e.g., Zielinski, 2008; Derwing & Munro, 2009). However, not all published mixed methods phonological studies are explicitly labeled as “mixed methods,” which may make them difficult to locate in tables of contents or online searches. Furthermore, the authors may not emphasize their reasons for using more than one method or describe the research design in much detail. The following is an example of a mixed methods study situated within the subdiscipline of second language (L2) phonological research. The focus is to address the rationale for integrating quantitative and qualitative methods, to discuss the nature of the mixing that occurred in the data collection and analyses, and to emphasize how quantitative and qualitative data were converged to yield rich empirical outcomes relevant to the research purpose.

The study arose from the widely held view among pronunciation experts that intelligibility should be the foremost goal of L2 pronunciation instruction (Morley, 1991; Munro & Derwing, 1999). However, it remained to be explored whether intelligibility is an appropriate criterion for assessing the pronunciation of non-native-speaking graduate students in academic settings. Many international teaching assistants (ITAs), for example, are expected to carry out instructional duties in their L2 in addition to their academic tasks. While several factors are clearly important for any instructor’s pedagogical success, pronunciation is often identified as the culprit for poor ITA performance from the perspective of language experts, students, and ITAs themselves (Hoekje & Williams, 1992; Cheng, Myles, & Curtis, 2004). Situated at a North American university where ITA screening does not currently take place, the present study sought to examine whether the criterion of intelligibility is “enough” (i.e., a sufficient goal) for assessing pronunciation proficiency in non-native English-speaking graduate students. A secondary goal was to explore which aspects of pronunciation most interfere with intelligibility from the perspective of both undergraduate students, who have a stake in understanding ITAs in real-world contexts, and a pronunciation expert (the researcher).

Ultimately, it was the need to adequately address the research questions that dictated the decision to mix methods. The reasoning was that drawing on a single method or source of evidence would have been too restrictive in shedding light on the complex phenomenon of intelligibility, which encompasses both speech production and perception (Morley, 1991), and for evaluating its suitability as an assessment criterion for non-native graduate students. This philosophical orientation of doing “what works” in order to answer the research questions, often referred to as pragmatism in the mixed methods literature, was embraced in this study (Greene, 2007, pp. 83–5; Teddlie & Tashakkori, 2009).

2 PHONOLOGY: MIXED METHODS

Figure 1 Mixed methods research design © Talia Isaacs

Note. The speech data were collected prior to the listener data. Qualitative and quantitative data for the listener questionnaire were collected simultaneously.

Data Collection Procedure

For the purpose of this investigation, intelligibility was defined as the percentage of a non-native speaker's words that listeners indicate being able to understand. Speech samples of eight non-native English-speaking graduate students telling a story and expressing an opinion were audio recorded, randomized, and burned onto CD. Eighteen native English-speaking undergraduate students then listened to and assessed each speaker's intelligibility on a 0–100% rating scale. After a second listening, the listeners consulted a list of potential pronunciation problem areas (e.g., individual sounds, word stress, sentence rhythm, rate of speech, pitch, and speech clarity) and rank ordered the top three features, if any, that had most hindered their understanding of the speaker's words. Within each ranked category, they were then asked to identify the source of the problem by selecting one of two options. For example, if they had selected "speech clarity," they were asked to identify whether the most prominent problem was that the speaker "overpronounces" or "mumbles" (see Isaacs, 2008b, for more on procedures and instruments). Finally, the listeners indicated whether they felt that the speaker's pronunciation was sufficient for him or her to instruct an undergraduate course as a teaching assistant (TA).

The listeners' responses described above, which were a quantitative source of evidence, were obtained through closed-ended questionnaire items. In fact, the same listener questionnaire was used to collect qualitative data simultaneously through open-ended questions. The listeners were invited to provide written comments on their impressions of the speech at any time during the rating session. Figure 1 illustrates the research design of this study, which is classified as a mixed methods triangulation design in Creswell and Plano Clark's typology (2007, pp. 62–7). The interplay between quantitative and qualitative methods, where one method is used to clarify or expand upon findings from the other, is considered an advantage of this design.

Data Analysis

The qualitative speech analysis was a data-driven process that involved the transcription of the speech data into phonetic symbols, the development of a transcription system for suprasegmentals, and the use of color coding to identify unintelligible words. The researcher

color coded the data twice during separate listenings to check for consistency. Then the qualitative data were “quantitized” (Teddle & Tashakkori, 2009, p. 343), or transformed into quantitative data, by counting the total number of coded instances of unintelligibility, so that the ratio of unintelligible words over the total number of words could be calculated for each speaker. The speech samples were additionally analyzed quantitatively for speaking rate, or the number of syllables uttered per second, and articulation rate, or the number of syllables uttered per second excluding pauses that exceeded .5 seconds (Munro & Derwing, 1998, pp. 166–7).

The quantitative listener data were analyzed using descriptive statistics and frequencies in SPSS 17.0. Cronbach’s alpha was computed preliminarily as a measure of inter-rater reliability by treating the 18 sets of intelligibility ratings as item scores. In preparation for analysis, the spreadsheet was organized by listing the eight L2 speakers in separate rows and the 18 raters in separate columns. An alpha coefficient of .883 revealed that raters were overall consistent in their judgments.

The qualitative listener comments were analyzed iteratively using an adaptation of Strauss and Corbin’s (1990) open-coding, with the overall goal of generating categories from the data. First, the data were transcribed in a word processor using speaker and listener identification codes. Next, the comments were grouped together according to a perceived common theme or idea, and meaning-laden words were bolded (e.g., “trails off on sentences. Doesn’t finish her thoughts” was grouped with “thoughts seem separated and disconnected”). The listeners’ own language was then used to label the categories and subcategories. Finally, the researcher’s language was imposed on the category labels where necessary to clarify meaning (e.g., the subcategory previously labeled, “Pronunciation is irritating but does not affect clarity of what is said” was more precisely designated, “A feature of the speaker’s pronunciation, while noticeable or irritating, does not affect overall intelligibility”). In order to check the consistency of the categorizations, the researcher randomized and recoded the data a few weeks later. Similar categories emerged both times, which revealed a high level of intra-coder reliability (Johnson & Christensen, 2008).

The quantitative and qualitative strands from the analysis of the speech and listener data were merged in an attempt to effectively answer the research questions. Specific cases of a few speakers will be illuminated in the presentation of the results in the manner of a case study (see Yin, 2003).

Table 1 Mean intelligibility ratings grouped by speaker

<i>Speaker</i>	<i>Intelligibility ratings</i>		
	<i>Mean (%)</i>	<i>SD</i>	<i>Ranking</i>
C	46.9	18.5	8
E	75.2	15.1	6
F	86.3	13.7	2
G	76.6	14.0	5
K	95.2	8.5	1
M	67.7	18.2	7
N	79.1	18.2	4
R	85.8	12.6	3
Group	76.6	20.2	

Note. Mean percentages are based on 18 ratings for each speaker and 144 ratings for the whole group.

Figure 2 Frequency of listeners' responses to the "TA question" © Talia Isaacs

Results

The first research question examined whether intelligibility is a sufficient criterion for assessing the pronunciation of non-native English-speaking graduate students. Table 1 shows that Speaker K emerged as the most intelligible speaker overall. The percentage of his words that the listeners indicated being able to understand was about 9% higher than that of Speaker F, the second highest performing speaker. In addition, Speaker K's low standard deviation relative to all other speakers indicated that the listeners reached the greatest consensus about his degree of intelligibility. At the other extreme, Speaker C was regarded as the least intelligible speaker. Her mean intelligibility rating was over 20% lower than that of the second least intelligible speaker (Speaker M) and was nearly 30% below the group mean.

Figure 2 shows that no listeners felt that Speaker C's pronunciation was adequate for her to instruct an undergraduate course as a TA (hereafter referred to as the "TA question"), although 1 in 6 were uncertain. Speaker M, the speaker with the second lowest intelligibility rating, was the only other speaker who received more negative than positive responses to the TA question, although her outcome was better than Speaker C's. At the other end of the spectrum, Speaker K's top ranking for intelligibility was not maintained on the TA question. Clearly, a majority of listeners endorsed Speaker K as a TA. However, Speaker F surpassed him as the top ranked speaker by receiving slightly more positive responses and fewer negatives. Although this difference between Speaker K's and Speaker F's scores may seem negligible, it was key to understanding whether intelligibility is "enough" for ITAs from the perspective of undergraduate students. In fact, two listeners who had rated Speaker K's words as 100% intelligible responded "no" to the TA question. One elaborated, "only a few problematic words, but would be quite annoying as a TA," and the other commented, "far too slow, as a TA, he would be quite boring" (Isaacs, 2008a, p. 52). Additional evidence was needed to probe why Speaker K's nearly fully intelligible pronunciation did not translate into the same degree of consensus among undergraduate listeners about the adequacy of his pronunciation to serve as a TA with instructional duties.

The researcher's quantitative analysis of Speaker K's fluency showed that his speaking rate was the slowest overall (see Figure 3). In contrast, his mean articulation rate was over 1 syllable/second faster than that of the second fastest speaker (Speaker N). The supra-segmental transcriptions, which included the use of textual symbols for pauses and tempo, indicated that Speaker K consistently paused at the end of thought groups. So while Speaker

Figure 3 Speaking rates and articulation rates, from Isaacs, T. (2008). Towards defining a valid assessment criterion of pronunciation proficiency in non-native English speaking graduate students, *Canadian Modern Language Review*, 64(4), figure 3, p. 570. Adapted and used by permission of University of Toronto Press Incorporated (www.utpjournals.com)

K spoke relatively quickly during his phonation time (articulation rate) and paused at logical junctures, his pauses accounted for a substantial portion (62%) of his recorded speech. This can at least partially account for the following listener comments:

I feel frustrated waiting for him to get on with what he is trying to say.
 Though slow, the choice of words is excellent and the effect is soothing.
 Would be very good if he sped up to create better flow.
 Hard to link parts of sentence together.

Some listeners additionally remarked on Speaker K's monotone speech. The overall effect of Speaker K's speech and the presiding negative sentiment about his long pauses are perhaps best summarized by the following listener comment: "I understood all he said, but he spoke slowly and had no intonation in his voice which made it quite obnoxious." This implies that while Speaker K's words were largely intelligible, intelligibility was, at least in some listeners' views, an insufficient condition for him to instruct an undergraduate course as a TA. Nonetheless, intelligibility appeared to be a prerequisite for serving as a TA from the listeners' (undergraduate students') perspective. There was absolute consensus, for example, that Speaker C, who was judged to be the least intelligible speaker overall, should not be charged with a TA position on the basis of her pronunciation. It may be that there is a threshold level of intelligibility that is necessary to carry out instructional responsibilities as a TA for an undergraduate course. In this study, it appears that Speaker C is decidedly below that threshold. Her z-score (standard score) for intelligibility was the only one in the data set that exceeded one standard deviation below the mean ($z = -2.03$), although a precise cut-off was not defined.

Table 2 shows the pronunciation features that the listeners identified as being the most problematic. The caveat is that listeners did not appear to be able to distinguish the features that rendered a speaker unintelligible from those that, while noticeable or irritating, did

6 PHONOLOGY: MIXED METHODS

Table 2 Percentage of raters who identified the pronunciation feature as being the “most prominent problem” (raw frequency) grouped by speaker

Speech category	Problem cited by listeners	Speakers							
		C	E	F	G	K	M	N	R
Segmentals	Substitute sounds	72% (10)	31% (5)	22% (4)	41% (7)	—	41% (7)	—	50% (9)
	Delete/add sounds	35% (6)	53% (9)	—	35% (6)	—	47% (8)	28% (5)	—
Word stress	Wrong stress syll.	38% (7)	—	44% (8)	56% (10)	—	50% (9)	—	33% (6)
	Distinguish syllables	—	—	—	—	—	28% (5)	—	—
Sentence rhythm	Distinguish words	33% (6)	39% (7)	44% (8)	33% (6)	—	28% (5)	—	28% (5)
	Linking	—	22% (4)	—	—	—	—	—	—
Rate of speech	Too fast	—	—	—	—	—	—	50% (9)	—
	Too slow	—	—	—	22% (4)	67% (12)	—	—	—
Pitch	Pitch change	—	—	22% (4)	—	—	—	—	—
	Monotone	—	—	—	—	44% (8)	—	—	—
Speech clarity	Overpronounces	—	—	28% (5)	—	—	24% (4)	—	—
	Mumbles	72% (13)	22% (4)	—	28% (5)	—	41% (7)	67% (12)	29% (6)

Note. Only pronunciation features identified by 20% or more of raters are shown. Missing data are excluded from the percentage calculations.

impede intelligibility. The problem areas with the highest listener response frequencies were associated with Speaker C. From the standpoint of intelligibility based on the researcher's coding, what was most problematic about Speaker C's speech was, in the listeners' words, that "she sort of stopped & started," "rhythm very broken," "stutters, hesitates," "lots of unsure pauses," and "words are slurred incomprehensibly" (Isaacs, 2008a, p. 60).

Speaker C's abrupt utterance [»ŋ wən əj« (1.) wən əj] shown in Figure 4 remained unintelligible to the researcher even after multiple listenings at a reduced speed. In contrast to Speaker K, Speaker C's pauses did not appear at the end of thought groups, which may have led some listeners to perceive them as sounding "awkward." The jarring "slow to fast to stop to start" of her "erratic speech," as some undergraduate listeners described it, was analogized as sounding like the sputtering engine of a stalled car by the researcher in a research memo.

Concluding Remarks

Taken together, the listeners' and researcher's analysis of the speech did not provide conclusive evidence as to which pronunciation features most impede intelligibility. However, the different sources of evidence appeared to reveal that the problem areas identified under the categories "individual sounds," "word stress," and "speech clarity" played the most important role in the researcher's and undergraduate listeners' perceptions of unintelligibility. Conversely, "sentence rhythm," "rate of speech," and "pitch" tended to impede perceptions of intelligibility only when they acted in conjunction with another problematic pronunciation feature. More research is needed to isolate pronunciation features and examine impacts on intelligibility (e.g., Hahn, 2004). Such research is likely to be enriched by the different perspectives offered by multiple methods, where the strengths of one method compensate for the weaknesses of the other.

Pike, Kenneth Lee

THOMAS N. HEADLAND

Kenneth L. Pike (1912–2000) was born in East Woodstock, Connecticut. He received his Bachelor's degree in 1933 from Gordon College (then in Boston). In 1935 he joined the then-budding Summer Institute of Linguistics (now SIL International) and served in Mexico studying Amerindian languages. He received his PhD in linguistics at the University of Michigan in 1942 under Charles Fries. Leonard Bloomfield was also on his dissertation committee. Pike was the recipient of 10 honorary doctorates or professorships from universities around the world, including the University of Chicago, Université René Descartes, the University of Lima, and Albert-Ludwigs University in Freiburg, Germany. His leadership roles included serving as president of the Linguistic Society of America, president of the Linguistic Association of Canada and the United States, and from 1942 to 1979 president of SIL. He was chair of the University of Michigan Linguistics Department from 1975 to 1977 and director of the English Language Institute at the University of Michigan at the same time. For almost forty years he divided his time between the University of Michigan (where he taught for thirty years) and SIL, as director of the SIL school at the University of Oklahoma and helping to establish other SIL schools around the world. He lectured in 42 countries and studied well over a hundred indigenous languages in the field, including endangered languages in Australia, Bolivia, Cameroon, Côte d'Ivoire, Ecuador, Ghana, India, Indonesia, Mexico, Nepal, New Guinea, Nigeria, Peru, the Philippines, Sudan, and Togo. His last trip overseas was to Indonesia in 1995, where he was the plenary speaker at the International Conference on New Guinea Languages at Cenderawasih University. He was actively lecturing and writing until 1997, when his health required him to slow down.

Pike's contributions to the field of linguistics combined with his dedication to the minority peoples of the world brought him numerous honors. He was recipient of the Presidential Medal of Merit from the Philippines and the Dean's Medal at Georgetown University. He was nominated for the Nobel Peace Prize for fifteen years in a row and for the Templeton Prize three times. At the time of his death he was professor emeritus of the University of Michigan; president emeritus of SIL; and a member of the National Academy of Sciences, the American Philosophical Association, and the American Anthropological Association (AAA). Pike published 30 books, 200 scholarly articles, 90 articles for popular magazines, and over a thousand poems (Spanne & Wise, 2003). His last book publication was in 1997—a five-volume set of poems (Pike, 1997). He published three articles in 1998 and two in 1999 (Pike 1998a, 1998b, 1998c, 1999a, 1999b). He had just completed a historical essay on "Early American Anthropological Linguistics" the month before his death (Pike, 2003).

Pike's Contribution to Linguistics

Pike's major academic contributions to linguistics were his textbooks on *Phonetics* (1943), which was called "The most thorough survey up to that time of the phonetic possibilities of the human vocal tract" (Beddor & Catford, 1999), *The Intonation of American English* (1945), *Phonemics* (1947), and *Tone Languages* (1948), all published by the University of Michigan. All four of these texts are recognized as seminal contributions today.

His major theoretical contribution in linguistics was his development of tagmemics, an important theory in American linguistics until the paradigm shift toward Noam Chomsky's transformational grammar theory in the 1960s (Chomsky, 1957). Pike's magnum opus, *Language*, on tagmemic theory was first published in three volumes in 1954, 1955, and 1960, and then in a second edition in 1967 (Pike, 1967). Several years later he published a much shorter book, *Linguistic Concepts*, describing his tagmemic theory to undergraduate students (1982).

Pike's practical contribution in linguistics was in his amazing ability to train students to learn, analyze, and publish data on then-unknown minority languages. One of his major goals was to help his graduate students and his SIL colleagues with their linguistic challenges. To that end, he established linguistic workshops around the world, where he and his major protégés helped hundreds of field researchers and Bible translators with difficult analytical challenges in aboriginal languages. Long before the concept of "endangered languages" came into vogue in the 1990s, Pike was instilling in his students the importance of recording, preserving, and working to keep alive the many unwritten, unknown languages spoken throughout the world. Who would have guessed in the 1940s that there were some five thousand such languages that were unidentified even to linguists?

Pike's holistic approach to language learning became his trademark. He eventually taught thousands of students and missionaries how to learn and document such languages, many of them by using the method that he demonstrated countless times in his famous "monolingual demonstrations." (See Makkai, 1986/1998.) Pike was at his pedagogical best when he did his monolingual demonstrations. When he first went to live with the Mixtec people in southern Mexico in 1935, he knew no Spanish, and nor did the San Miguel Mixtecs. So he began learning their language monolingually, since they shared no common language. Later, he began to demonstrate his method to students. As Beddor and Catford (1999) point out, "Pike is legendary for his demonstrations of the monolingual field technique in which he shows, through a 40-minute exchange with a native speaker of a language unknown to Pike, that language can be learned without an interpreter." His sister Eunice Pike explained it this way:

Watching [Ken's demonstration] is something like watching a high diver in Acapulco, Mexico, as he dives from the cliffs there into the ocean below. It's beautiful, and you know he's an expert, so you don't expect trouble, but there is always the chance that he might end up on the rocks instead of in the ocean. That possibility makes you watch all the more intently. (E. Pike, 1981, p. 130)

Today Pike's students have produced thousands of linguistic documents on some 2,700 languages in fifty countries (SIL, 2010) and we now know there are some 6,900 languages in the world (Lewis, 2009). Most of these are spoken by only a few hundred to a few thousand people and almost all are what is called today "endangered languages."

Pike's Contribution to Anthropology

Pike's major contribution in anthropology was his development of the emic/etic concept. He published this conceptual contrast in 1954 in his first edition of *Language*, and the two terms are found in common usage in the vocabularies of most anthropologists today. The emic/etic distinction underlies a basic contribution of modern anthropology, a uniquely anthropological tool for understanding different perceptions of reality between cultures.

The high point of Pike's role in the AAA came in 1988. During that year's annual meeting of the AAA, Pike and cultural materialist Marvin Harris had a historic public debate on their differing uses of the emic/etic concept. That exchange resulted in a book titled

Emics and Etics: The Insider/Outsider Debate (Headland, Pike, & Harris, 1990).

Pike also had a low point in anthropology. He was a controversial figure among anthropologists because he was a missionary. This low point in the AAA came in 1975 when anthropologists brought a formal charge of ethnocide against SIL to the AAA's Committee on Ethics. The charge is named in the SIL archives as "COE's Case 75-2" (Pike Special Collection, n.d.). In May of that year, the AAA wrote a letter to SIL describing the complaint and inviting SIL to formally respond. Pike replied to the AAA in a 15-page letter dated May 21. After a one-year investigation the COE's report to the AAA Executive Board declared unanimously in favor of SIL. In a letter to Pike dated September 20, 1976, AAA executive director Edward Lehman stated, "At its 85th meeting in May [1976], the [AAA] Executive Board accepted that [COE] recommendation, also by a unanimous vote." This was hardly the only time that Pike defended SIL against its critics. The last time he did this was when another group of anthropologists accused SIL of genocide in the AAA's *Anthropology Newsletter* (Edelman, 1997). Pike replied to that, and the AAA published it in a later issue of the *Newsletter* (Headland & Pike, 1997).

Concluding Remarks

We cannot close this review of Pike's life without mentioning his Christian philosophy, and how this was such a driving force in his life and leadership of SIL, and in his contribution to applied linguistics. He was keenly interested in the religious dimension of his career, as seen in his relationship with Wycliffe Bible Translators, the sister organization of SIL. He and Angel Merceñas completed the translation of the New Testament into the San Miguel Mixtec language in 1951. Pike was above all a convinced Christian theist who influenced thousands of people toward religion. He wrote numerous religious articles and books. His *With Heart and Mind* (Pike, 1996) defended scholarly and intellectual approaches to Christianity, maintaining that Christian faith and academic scholarship can be intimately integrated.

Today the huge volume of Pike's personal and work-related papers is archived in the Pike Special Collection as part of the SIL Language and Culture Archives in Dallas, Texas. These materials include unpublished academic papers, lecture notes, teaching resource materials, personal and SIL corporation correspondence, diaries, awards and honorary recognitions, and many photos and work-related artifacts. Researchers desiring access to the collection must complete and submit the SIL Language and Culture Archives Access Policies and Registration before making an appointment with the curator. For details see www.sil.org/klp/klp-special.htm. Many other details on Pike are found at this same URL address.

Plagiarism

DIANE PECORARI

Plagiarism Defined

Plagiarism can be defined broadly as an illegitimate and deceptive intertextual relationship. Such a broad definition is necessary in order to encompass the wide variety of acts which have been labeled plagiarism; the word has been used to apply to works as diverse as poems and paintings, recipes and novels, the findings of scientific research articles and textbooks.

The definition of plagiarism offered by the *Oxford Dictionary of English* is “the practice of taking someone else’s work or ideas and passing them off as one’s own” (Soanes & Stevenson, 2003, p. 1344). This definition is typical in that it includes, directly or by implication, three elements. First, some sort of textual material is involved. While it is true that plagiarized content may be an idea, rather than the form in which it is expressed, in order for plagiarism to occur the idea must have been articulated, and it must be repeated by someone else. There are, therefore, always at least two texts (in the broadest sense, to include written and spoken, as well as graphic, material) involved in plagiarism: an original source, and the text which reuses it. The second element in plagiarism is a direct relationship between the two texts. Similarities of propositional content, expression, or both, may arise in texts on related topics simply by coincidence, and by virtue of the fact that a limited number of forms are available for articulating a given idea. However, for plagiarism to be said to have occurred, more than coincidental similarity is required; the similarities must be due to the fact that the later text was based on the earlier one.

The third criterion for plagiarism is that this direct intertextual relationship must be illegitimate. This can be illustrated by contrasting plagiarism with other sorts of direct, but legitimate intertextuality, such as quotation or parody. In the case of quotation, language which is repeated from its source is visibly identified, most often with quotation marks, and the source is ordinarily named. In the case of parody, the source often goes unnamed, but an expectation exists that the reader or listener will be able to identify it. Indeed, the point of parody is lost if that identification is not made. Thus the illegitimacy of plagiarism derives from the fact that it is deceptive in nature, an attempt to “pass off” the plagiarized material “as one’s own” when it is in fact not.

Detecting Plagiarism

A great deal of plagiarism detection has traditionally happened casually, when a reader notices similarities between two texts. In an essay on plagiarism Stearns (1999) recounts the experience of editing a work of history. Consulting another book on the same topic to verify certain facts, she recognized paragraphs in the published volume which she had also read in the manuscript. In the classroom, teachers often grow adept at spotting changes in register or proficiency in writing as a sign that plagiarism may be present in a text.

More recently, electronic text-comparison tools have also become available and have been marketed as “plagiarism detection” tools. Text-comparison services are widely used

by educational institutions, at both tertiary and secondary levels. Teachers or students at subscribing institutions send student writing to the service. The student's electronic file is compared to sources on the Internet, or to other student-written texts, or both. The text-comparison tool then generates a report stating whether the student work has language in common with other texts, and if so, which texts. The report also provides a numerical expression of the degree of similarity, typically expressed as the percentage of the text under scrutiny that is shared with other texts.

Text-comparison software has been greeted with enthusiasm by teachers, for a number of reasons: there is a widespread perception that the incidence of plagiarism is increasing, in part due to the availability of electronic sources. Automatized plagiarism-detection systems seem to offer the opportunity to screen all student work in an efficient way, thus permitting more consistent treatment of all students and a better detection rate for plagiarism.

However, there are also several problems associated with the use of text-comparison software. Because their objective is fundamentally to match language which co-occurs in two or more texts, such products can identify quotation or other sorts of legitimate language reuse as potentially problematic. Resolving whether the texts thus flagged actually constitute plagiarism requires a close examination by the teacher. Text-comparison software can also yield false negative results. One reason for this is that comparisons can only be made with electronic sources which are available to the tool. A text which is copied from a paper source, or an electronic source from a password-protected database, may not be detected. The consequences of false negative results cut two ways: if a writer who intended to plagiarize is not detected, a lack of consistency in handling plagiarism may be the result. On the other hand, a writer who was genuinely under the impression that his or her illegitimate source use strategies were appropriate will have that (mistaken) impression confirmed by a "clean" report. Other concerns with these products include the possibility that by extracting the question of repeated language from the wider writing context, "legitimate attempts to conform with the expectations of the community of practice often become identified as plagiarism and illegitimate attempts at cheating often become obscured from view" (Hayes & Introna, 2005, p. 55).

Establishing Plagiarism

When potentially problematic source use is detected, a further difficulty can arise in determining whether it constitutes plagiarism; for this reason, cases of alleged plagiarism which receive public exposure are often the subject of heated debate. The difficulty often lies in determining whether the disputed text is characterized by the three elements of plagiarism described above. There may, for example, be room for disagreement about whether similarities between the suspected text and its purported source are coincidental or not.

Similarly, even when an intertextual relationship is acknowledged, there may be a question about whether or not it is appropriate. Uncertainty in this area may be due in part to the fact that the numerous contexts in which plagiarism can arise have distinctly different conventions; sources are formally attributed in journalism (for example) in a different way than in academic texts. The existence of different conventions leaves room for varying views about what crosses the line and should be seen as unconventional. A case which illustrates this point arose in the mid-1990s, when a medical researcher in Hong Kong accused a colleague of plagiarizing a questionnaire she had developed for her research. A key element in the legal action which ensued was expert witness testimony to the effect that the sharing of questionnaires was common practice in the field (Dyer, 1995). Although parts of the questionnaire may have been reused, the witness thus argued that such reuse was not unconventional by the standards of the discipline.

Finally, even when source use is acknowledged to be less than fully appropriate, it may be debated whether it constitutes plagiarism. When a professor at Stockholm University was accused of plagiarism, a university official criticized her source use as less than best practice, but defended the university's decision not to investigate the accusations as possible misconduct (Gunnarsson, 2005). The question of intention may become relevant in this context. Accusations of plagiarism involving the popular historian Stephen Ambrose received wide public attention, but at least one fellow historian defended him, in part on the grounds that his sources were cited, suggesting that he did not intend to deceive the reader (Jensen, 2002).

Plagiarism in the Legal System

Plagiarism is a breach of convention rather than law and is thus a matter of interest for forensic linguistics when it is implicated in some other matter. One such context is copyright violation, though, as Stearns points out, the overlap between plagiarism and copyright violation is not complete. Copyright law is intended to protect only certain texts (not those over a certain age, for example) and is concerned exclusively with the expression of ideas, rather than the ideas themselves. In addition, plagiarism may not be substantial enough in scope to constitute copyright infringement, or may not be found to have caused the copyright holder a financial loss which can be remedied. Thus, "while plagiarism is a failure of the creative process as manifested in unattributed copying from any source, copyright law examines the harm that results from copying" (1999, p. 10).

The gap between plagiarism and copyright violation was clearly illustrated in the legal action brought against Dan Brown, author of *The Da Vinci Code*, by the authors of an earlier book on a similar theme, *The Holy Blood and the Holy Grail*. Although the original judge in the case found that portions of *Holy Blood* had been copied in *The Da Vinci Code*, the nature of the copied material and extent of the copying was not substantial enough to constitute copyright infringement, and this judgment was subsequently upheld on appeal (Baigent & Anor vs. Random House, 2007).

Legal action may also result from the consequences of an accusation of plagiarism. Plagiarism is an extremely stigmatizing act, and allegations not infrequently result in individuals in fields such as journalism and academia being dismissed, or forced to resign, from their positions. In adjudicating cases of unfair dismissal (or related questions) courts may be in the position of having to decide whether plagiarism occurred. This was the case in an episode in Hong Kong in which a journalist was dismissed from his job after his newspaper claimed that he had copied parts of an article from another publication, and said that that act constituted professional misconduct. Whether or not the journalist had plagiarized became a key factor in the suit for wrongful dismissal he brought against the paper (Thomas Vincent vs. South China Morning Post, 2004).

Universities commonly sanction students who have committed plagiarism by withholding academic rewards, and in 2004 a student at a British university threatened that he would take legal action against his university for doing so unfairly. Shortly before the student was due to take his degree, plagiarism in a piece of his assessed coursework had been found. The discovery of that plagiarism triggered an investigation of the student's earlier assignments, and further plagiarism was uncovered. On the basis of these discoveries, the university expelled the student. The student's threat of legal action was based on what he perceived as negligence on the part of his university, because they had not warned him earlier in the course of his education that his writing practices were unacceptable (Baty, 2004).

In a twist on the relationship between copyright violation and plagiarism, secondary school students in the USA sued Turnitin, a company providing a text-comparison (“plagiarism-detection”) service, for copyright violation. Like other, similar services, Turnitin archives student work sent in for examination. The texts then form part of the database against which future student work is compared. The students who brought the suit believed that the archiving of their texts violated fair use principles (Glod, 2007).

Research on Plagiarism

Existing and ongoing research on plagiarism spans a number of subject areas. Within educational research plagiarism has been investigated as a form of cheating or a violation of ethical standards (e.g., Ashworth, Bannister, & Thorne, 1997). Such research often works from an assumption that there is a common understanding of what types of source use are allowed, or forbidden (though exceptions exist; see, for example, Roig, 1997).

Within linguistics, research on plagiarism has been conducted primarily within the areas of forensic linguistics and language for academic purposes. In the former area, the question of plagiarism overlaps closely with authorship attribution. An important question in this context is the degree of similarity between texts that is, and is not, likely to arise coincidentally. In other words, is there a threshold above which linguistic similarity should give rise to suspicions of plagiarism? This question has been investigated with respect to student writing (Johnson, 1997; Pecorari & Shaw, in press), literary translation (Turrell, 2004), and published research writing (Pecorari, 2008).

Within the branch of applied linguistics concerned with the teaching of language for academic purposes (and the closely related field of composition studies), the concept of plagiarism has been problematized and shown to be highly contextually bound. Questions of research interest in this area include how writers learn to produce academic discourse (Howard, 1995) and to meet the expectations of their disciplinary discourse communities (Pecorari, 2006). Ample evidence has been produced to show that much writing which appears to be plagiarism—in that it is based on unconventional intertextual relationships—is the result of factors other than deceptive intent (e.g., Abasi, Akbari, & Graves, 2006). Much current research on the topic thus is aimed at identifying the causes and remedies for unconventional source use (e.g., Keck, 2006).

Policy Analysis and Document-Based Literacy Research

LISA PATEL STEVENS AND MATTHEW LALIBERTE

In Lisa Patel Stevens's undergraduate training as a print journalist, a professor handed her the journalistic charge succinctly: A newspaper should convey what it was like to be alive on that day in that place. Fairly straightforward, right? However, even a cursory scratch of the surface of that statement agitates and enlivens the complexity that spills over the capacity of texts to capture lived realities neutrally. For example, depending upon the news source, the flooding of New Orleans during Hurricane Katrina was a natural disaster of climate patterns or a human-made disaster of civil engineering. Also depending upon your lived experiences, the reporting of these events may be, in and of themselves, textual acts that perpetuate racial inequities in the United States. It is within this complexity of texts as representative and agential that policy analyses and document-based literacy research finds itself.

Literacy research has been informed by various approaches and methodologies. With sociocultural views of literacy strengthening in the late 20th century, these perspectives also influenced the ways in which literacy practices were researched, the ways in which researchers examined, and the ways in which they conveyed findings of these examinations. As observation of literacy practices and interviews about these practices took strong hold as methods of literacy research in authentic settings, so did analysis of policies and documents that shaped and addressed literacy practices.

At the heart of archival and policy analysis is a positioning of text and language as key sources of containers and shapers of material and figurative worlds. Texts are in constant dialogical relationships with participants and contexts, both enacted by and enacting meanings. A focus upon language as a source of meaning both thickened and was complicated by the advent of explorations of the structure of language (Saussure, 2006) and then the poststructural ellipse between language and meaning (e.g., Foucault, 1972). Increasingly, the role of language in the interplay of individuals, institutions, and society has solidified as one of the most frequently researched sources of knowledge. Situated within the field of applied linguistics and the larger transdisciplinary theories of semiotics, policy, and archival analyses are methodological approaches to investigating the ways in which literacy beliefs, practices, and competencies are in dialectical conversation with texts.

Textually Based Research: The Elision of Text and Meaning

Archival and policy texts, like any other texts, are representations, and by that definition, are partial and incomplete. As partial and incomplete representations, they are always contested, and at many levels. It is thus critical to consider the perspectival act of conveying and constructing meaning. Take, for instance, the following definitions of policy, which is one type of text:

[Policy is] the expressed intentions of government actors relative to a public problem and the activities related to those intentions. (Dubnick & Bards, 1983, p. 8)

2 POLICY ANALYSIS AND DOCUMENT-BASED LITERACY RESEARCH

[Policy represents] the temporary settlements between diverse, competing and unequal forces within civil society, within the state itself and between associated discursive regimes. (Kenway, 1990, p. 59)

[Policy is] substantive decisions, commitments, and actions made by those who hold or affect government positions of authority, as they are interpreted by various stakeholders. (Bryson & Crosby, 1992, p. 63)

Policy is the rational attempt to attain objectives. (Stone, 1997, p. 37)

[Public policy] includes both official enactments of government and something as informal as "practices." Also, policy may be viewed as the inactions of government, not simply what the government does. (Cibulka, 1995, p.106)

Policy is clearly a matter of "the authoritative allocation of values"; policies are the operational statements of values . . . policies project an ideal society. (Ball, 1990, p. 3)

Public policy is the dynamic and value-laden process through which a political system handles a public problem. It includes a government's expressed intentions and official enactments as well as its consistent patterns of activity and inactivity. (Fowler, 2000, p. 9)

These are but a few of the many definitions of policy, and yet, without a clear understanding of what policy is and is not, the analysis of a policy and its outcomes becomes more narrowly construed. Without due attention to the ideologies and discourses underpinning and strewn throughout policies, analyses are cauterized in their insights and utility. It is essential, then, that attention is paid to the way in which a policy is positioned in order to offer an informed analysis.

Taking up this charge to be explicit about the definitions of what counts as a text, particularly a policy text, Taylor, Rizvi, Lingard, and Henry (1997, pp. 15–17) articulate a series of general observations relative to the constituent parts of all policies, which they perceive to be both processes and products. These observations are adapted here to situate the nature of archival and policy texts better.

1. Texts are more than words, sentences, and paragraphs: Texts are dynamic, interactive, and interpreted reflections of society that are situated temporally, culturally, socially, and geographically.
2. Texts are multidimensional: Texts are conceived of, written, and interpreted differently by different individual and institutional actors.
3. Texts are value-laden: Values permeate all aspects of texts, from conceptualization to drafting, binding to illustration, and revision to completion. Who decides is thus of central importance to each constituent element of the process.
4. Texts exist in context: No text exists in isolation; rather, the historical location, socio-economic milieu, and overriding ideological and political climate all influence the shape and tenor of a particular text.
5. Texts interact with other texts: Texts are both discrete and interrelated, whereby they influence, are influenced by, and interact with other texts, creating new spaces for discourse, conflict, debate, and understanding.
6. The analysis of texts is never straightforward: texts are necessarily interpreted and mediated by the complex social, economic, political, and ideological dynamics of the lived realities of individual and institutional actors.
7. Texts convey intended as well as unintended messages: As a function of the myriad perspectives a reader brings to bear on a text, and the writer's own overt and covert intent, the interaction effect of context, and a multitude of perspectives working in parallel to one another yield variable interpretations.

Taken in their entirety, these observations tell us that texts of all kinds are both products and processes caught in a state of ongoing interpretation and transformation. Texts thus serve to not only state values purposefully and covertly, but they also serve to reify and operationalize those values, highlighting their intensely political character. The subsequent process of meaning making within a text rests in large part on the epistemological stance brought to the text by the reader that functionally influences how the text is perceived, read, analyzed, and reflected upon. From a research stance, the epistemological approach of the researcher will be inscribed into the methodological choices of text, analysis, and implications.

Approaches to Archival and Policy Analysis

Increasingly, archival and policy analyses have striven to both situate the production of texts within the sociopolitical contexts and to consider the choices and effects of what is contained within texts and what is excluded. Using methodologies such as discourse analysis, frame analysis, and content analysis, literacy researchers have explored the ways in which texts construct, structure, and reflect lived realities.

One of the most common approaches to policy analysis in educational research is critical discourse analysis. Falling in theoretical concert with critical approaches such as critical race theory, queer theory, feminist theory, and postcolonial theory, critical discourse analysis is imminently concerned with power, but geographically locates the work with the dialectics of language and text (Fairclough, 1995). Literacy research that employs critical discourse analysis (CDA) does so to explore the ways in which power inequities are inscribed into texts and practices with texts (e.g., Woodside-Jiron, 2003). Particularly abundant have been the uses of critical discourse analysis to explore the ways in which federal policies, beginning in the Clinton presidency and continuing through subsequent administrations, have delineated the role of teachers, students, and schools in contemporary times of increasing privatization, increasing achievement debts (Ladson-Billings, 2006), and technicist approaches to pedagogy and curriculum (Luke, 2004). Inherent in these studies and the knowledge mined from them are the ideologies at play in the policies. These studies, coming largely from a critical theoretical stance, have critiqued these ideologies as figurative assaults on public education and social justice. However, critical discourse analysis itself has been critiqued as being inordinately leftist in its ideology and hence in the knowledge yielded from studies using critical discourse analysis.

Frame analysis, used more in communication studies and sociology than education, presents a compelling counterpart to critical discourse analysis. Similar to CDA's interest in how texts both reflect and shape lived realities, frame analysis is also used by researchers who take for granted that texts are always partial. However, frame analysis is particularly interested in how ideologies are leveraged to frame texts for particular purposes. Frames are used to shape meanings and to convey and promote messages as well as policy. Bateson (1972) offers a useful metaphor for clarifying the concept of frames saying, "The frame around a picture, if we consider this frame as a message intended to order or organize the perception of the viewer, says, 'Attend to what is within and do not attend to what is outside'" (p. 187). All message makers (or framers) use cultural resources like beliefs, ideologies, values, and myths in order to frame a message that legitimates, motivates, and persuades an intended audience by deliberately choosing what is contained within the frame and what is not.

Therefore, frame analysis looks at frames as methods of conveying and reading beliefs, ideologies, values, and myths by both noting which of these resources are drawn on to create the frame as well as which of these cultural resources are not utilized and to what

effects (Davies, 2002). However, different than content or critical discourse analysis, frame analysis focuses upon the ideologies used to frame texts as a reflection both of the authors' intents and the likely perspective of the reader and user. In this sense, frame analysis first posits texts as communicative, dialectic, and as relays for ideological synchrony, with implications for discussing the social contexts in which texts reside. From this stance, then, the research inquiry is to shed light on which ideologies are used to frame the text, to whom, and why.

Textual Analysis as a Research Method

However, within all textual analysis, the same bind exists that marks all textual processes: textual productions, whether a policy analysis or a media text, are all perspectival accounts. On the other side of the same coin, all interpretations of texts are similarly perspectival. Heretofore, literacy research using textual analysis has described this perspective as a limitation of the knowledge to be gained from archival analysis; however, this limitation can only be seen as such when beginning from a desired stance of knowledge as neutral. It is a limitation to have a perspective only if not having a perspective is preferred. From that stance, archival analyses can never truly achieve the most traditional definition of reliability, that of replicability. However, due to the nature of texts, of meaning making, and of knowledge gained from analytic research of texts, striving for neutrality is a false condition; it cannot be achieved. Rather, archival analysis should be presented more explicitly as a process, one that provides a set of rigorous analyses and interpretations of a text as a contribution to larger conversations about literacy, research, and education.

Politeness

MIRIAM A. LOCHER

Language is not just a means to pass factual content from one person to another, it is also a tool to shape relationships and thus to negotiate interpersonal meaning. When we use language, we therefore also reveal something about ourselves and our relationships with others. For example, when requesting, asking, or apologizing, people adapt their language use depending on the nature of their relationship with their addressee (e.g., father–child; employer–employee; friends) and the matter or topic in question. The choice of terms of address is another typical example to show the relational aspect of language. Not only will one and the same person be addressed differently throughout the day (as wife, mother, professional, etc.), she will reciprocate depending on factors such as power, affect, distance or closeness, the roles of the interactants, and the norms of appropriate conduct in the particular context. For decades, linguistic research has been interested in this relational aspect of language, the factors which influence it, and the ways people shape and exploit the social norms that guide their social practices. The term “politeness” is closely linked to this research field and the notion has now been a popular topic in linguistics for over 30 years (for overviews see Suggested Readings). However, it defies easy definition both as a subject in research and as a lay term in a particular culture. In what follows, a selection of early approaches to politeness phenomena will be introduced. Then more recent developments in the field will be mentioned with respect to methodological and theoretical issues and the scope of language data investigated.

Several researchers in the 1970s and 1980s argued that “politeness” was a particular driving force in how people determine language choice and negotiate relational meaning. We can count the approaches by Lakoff (1973), Brown and Levinson (1978, 1987), and Leech (1983) among the early and influential contributions to the study of politeness. Working within a framework of pragmatics in the broad sense—the study of language in use—these researchers argued that there are not only syntactic rules in establishing grammaticality of sentences but also pragmatic rules that determine the appropriateness of language use. They thereby all endeavored to complement the cooperative principle (CP; Grice, 1975). In brief, the CP postulates that interactants, in their process of interpretation, work on the assumption that people adhere to four maxims: the maxims of quantity (be informative), quality (no falsehoods; no utterances that lack evidence), relation (be relevant), and manner (avoid obscurity or ambiguity, be brief and orderly; Grice, 1975, pp. 45–6). If interlocutors do not follow these maxims in the production of an utterance (and they frequently do not), their non-adherence results in additional meaning when the interpreter tries to work out why it took place. Politeness is then argued to be a motivation for non-adherence (Leech, 1983, p. 80). For example, people may speak in a less direct way (non-adherence to the maxim of manner) because politeness considerations overrule the Gricean maxims. Lakoff (1973, p. 298) proposes “rules of politeness” that affect language in use: (a) “Don’t impose,” (b) “Give options,” and (c) “Make [alter] feel good—be friendly.” She thus highlights that speakers orient toward their addressees and take their point of view into account. The rules as such express certain values attached to cultural norms, as it is considered negative to impose on others (first rule), to leave people without any choice (second rule), or to make them feel uncomfortable (third rule). Depending on the cultures, different rules will gain precedence (Lakoff, 1973, p. 303). In a similar vein, Leech (1983)

introduces the so-called “politeness principle,” which consists of six politeness maxims: the tact, generosity, approbation, modesty, agreement, and sympathy maxims. When confronted with having to work out an implicature caused by the non-adherence to one of the maxims of the cooperative principle, the addressees will then look for the motivation in one of the politeness maxims. For example, when a person answers “The children were in your room this morning” to the question “Where’s my box of chocolates” (Leech, 1983, p. 94), we can argue that the motivation to answer in this indirect manner lies with the wish to be tactful in not directly accusing the children of having taken the chocolates. In fact, Leech (1983, p. 108) associates indirectness with politeness by saying that “indirect illocutions tend to be more polite (a) because they increase the degree of optionality, and (b) because the more indirect an illocution is, the more diminished and tentative its force tends to be.”

This link between indirectness and politeness is also notable in the most influential work on politeness by Brown and Levinson (1978, 1987). They gave currency to the notions of “face” and “face-threatening act” in the research community. Face, originally taken from Goffman (1955), is defined as “the public self-image that every member wants to claim for himself [*sic*]” (Brown & Levinson, 1987, p. 61), and it is split into a positive (involvement) and negative (distance) aspect. Negative face is thus “the want of every ‘competent adult member’ that his actions be unimpeded by others,” while positive face is “the want of every member that his wants be desirable to at least some others” (Brown & Levinson, 1987, p. 62). Interlocutors are argued to be rational agents who take their own and the addressees’ face wants into account when producing language. However, the need to serve the two sides of face and the face interests of both speaker and addressee can be in conflict with each other. Face-threatening acts (FTAs) are “acts that by their nature run contrary to the face wants of the addressee and/or of the speaker” (Brown & Levinson, 1987, p. 65). When committing an FTA “x” is unavoidable, speakers will assess the risk of face loss, in other words the “weightiness” of the FTA (W_x), by taking power (P) and distance (D) factors between the interlocutors (S,H) into account, as well as the relative ranking of the imposition (R_x) of the specific FTA “x” in a cultural context (Brown & Levinson, 1987, p. 76). This results in the following equation: $W_x = D(S,H) + P(H,S) + R_x$. Depending on how strong the estimation of risk of face loss is, the speakers will determine linguistic strategies of mitigation or non-mitigation: (a) “Do the FTA on record,” “without redressive action”; (b) do the FTA “with redressive action” attending to positive face needs; (c) do the FTA “with redressive action” attending to negative face needs; (d) do the FTA “off record,” in other words the strategy is so indirect that the speaker can claim not to have intended the force of the utterance; or (e) choose not to do the FTA at all (Brown & Levinson, 1987, p. 60). In the case of strategy (a) the risk of face loss is estimated to be least strong; in the case of strategy (e) it is the strongest. Ultimately, Brown and Levinson equate politeness with the display of face consideration in the form of mitigation.

Brown and Levinson’s (1978, 1987) theory can easily be called the most influential contribution to this field of research. All the subsequent studies contributed to the plethora of publications on politeness either by reproducing their study design (e.g., in an attempt to establish cultural differences with respect to the orientation to positive or negative face needs), or by criticizing and challenging their work. The debates have raised several important issues; only two will be mentioned here. First, despite the fact that Brown and Levinson aimed at a universal framework derived from the study of Tamil, English, and Tzeltal, it was exactly this claim for universality that was challenged with respect to their key notion of “face.” Especially researchers on Asian languages and cultures argued early on that the notion of face captured predominantly Western values (involvement and distance) and was not applicable to their cultures to the same extent. This criticism has resulted in a very active research tradition on politeness in Asian languages, and especially on

forms of respect and deference in the form of honorifics (for overviews, see Haugh, 2010; Okamoto, 2010). The notion of face is still being debated in the research community at large. Second, the ranking of strategies according to risk of face loss has been challenged as well. Often attention to positive and negative face may co-occur in the same utterance, or the more indirect rendition of an FTA is not necessarily the more polite version. As Lakoff (1973, p. 303) has already pointed out, "what is polite for me may be rude for you." Members of a particular discursive practice might therefore object to an indirect form of a request, for instance, since their usual rules of conduct would deem indirectness to be inappropriate. Yet, despite such criticism of Brown and Levinson's work, their detailed description of linguistic strategies for interpersonal effect is unprecedented and explains its usefulness to this day.

The 1990s and early 2000s especially saw a rise in critical reassessments of the early work of politeness researchers, which resulted in two main trends: (a) discussing methodological and theoretical issues, and (b) broadening the scope of data and interest. Both trends will be briefly introduced here.

One of the questions discussed with respect to theory and methodology is concerned with whether one should take an *etic* (first-order) or an *emic* (second-order) approach to the study of politeness (see Eelen, 2001; Locher & Bousfield, 2008). Brown and Levinson's work represents a classic second-order approach in that they use the term "politeness" as a technical term to describe face-threat mitigation (irrespective of the addressee's assessment of the utterance). This approach was replicated in the early works on impoliteness, which mirrored the Brown and Levinson politeness strategies and their ranking (Lachenicht, 1980; Culpeper, 1996; Kienpointner, 1997). More recently, researchers such as Bousfield and Culpeper (2008), or Terkourafi (2005), while still firmly arguing for the benefits of a second-order approach to studying politeness and impoliteness phenomena, also develop Brown and Levinson's or their own frameworks further. Bousfield (2010), for example, argues for the use of technical terms, which are, however, informed by lay people's understandings of these very concepts. Ultimately, he is aiming for a predictive theory of politeness and impoliteness. In the same vein, Terkourafi (2005) explores a frame-based approach to politeness phenomena in that she investigates practices that come with expectations about appropriate behavior. She argues that a quantitative approach will help in capturing politeness phenomena and will allow for a certain level of prediction.

Researchers calling for a first-order approach (e.g., Mills, 2003; Locher & Watts, 2005) argue that the term "politeness" refers to a judgment of facework or relational work with respect to norms of conduct in a given context made by a member of a community of practice (see also the work by Watts, 1989, and Fraser, 1990, who pointed early on to the importance of judgments). This means that different groups of people may have different opinions about what counts as "polite." The recognition of a certain variability of judgments of "polite" expression, as mentioned by Lakoff above, is thus at the core of the first-order approach to politeness phenomena, combined with the aim to understand better how interlocutors negotiate the relational aspect of language use in general.

In addition, the term "politeness" is only one of many possible labels in English to describe "relational work," where the latter "refers to all aspects of the work invested by individuals in the construction, maintenance, reproduction and transformation of interpersonal relationships among those engaged in social practice" (Locher & Watts, 2008, p. 96). Other English labels for face-maintaining and face-enhancing relational work might be 'refined,' or 'polished,' while face-aggravating behavior might be referred to as 'impolite,' 'rude,' 'uncouth,' and so on. (Note that in this description "face-maintaining," etc., is used as a technical concept, while the lexemes in single quotes are *emic* terms.)

A further point for consideration is that terms such as "politeness," "impoliteness," or "rudeness" are hard to translate into other languages, precisely because they index cultural

values. For this reason, it is also problematic to raise a first-order evaluative lexeme of a particular language to a second-order (some would argue “universal”) theoretical concept. However, what seems to be a human (universal) trait is the fact that people negotiate relationships by means of appropriate language use, while the labels they give such behavior and the norms that govern the behavior are variable.

When considering “politeness” as an evaluative concept embedded in a particular cultural context, it is self-evident that the term as such holds no entirely stable meaning. “Politeness,” just like any other lexeme, can and does undergo semantic change over time. For example, in the eighteenth century in England the term “politeness” was linked to the court and evoked slightly different connotations than it does today (Stein, 1994). Further evidence for such changes are the numerous lay books on proper (linguistic and behavioral) conduct that have a long tradition in many cultures. Even within our own lifetimes, we can witness that these books describe slightly changing norms and expectations of proper conduct. All the mentioned changes and differences are interesting to explore from a synchronic as well as from a diachronic and cross-cultural perspective.

It should be stressed that norms are shared by groups of people, who acquire them by being socialized into practices. Social beings exploit knowledge of these norms to achieve their relational aims. For example, they might want to create a “polite” interpersonal effect, or they might wish to challenge relationships by creating “rude” interpersonal effects. In order for this to happen, there must be a certain overlap and shared understanding of norms of behavior. From a methodological point of view, first-order researchers have been caricatured to overemphasize variability and second-order researchers to overdo leveling. However, there is a certain consensus nowadays to look at politeness as a situated, cultural phenomenon, and to work on fruitful combinations of first- and second-order terminology and methodology (Locher & Bousfield, 2008).

Further methodological and theoretical discussions that have been raised center on how cognitive processes can be linked to the creation of relational and social meaning, the role of the recognition of intentions in the process of working out interpersonal meaning, the status of universality within the theoretical politeness frameworks, and the notion of face. The launching of the *Journal of Politeness Research* in 2005 (De Gruyter) bears witness to these new interests in methodological and theoretical issues in the field of politeness studies.

The second important trend in the last years of research is that both first-order and second-order researchers have broadened the scope of interest with respect to the nature of the investigated data. While many studies inspired by Brown and Levinson focused on linguistic speech acts such as requests, apologies, or criticism, which are traditionally associated with face-threatening situations that are conventionally mitigated, more recent studies also focus on explicitly face-damaging or face-aggravating behavior, and the notions of impoliteness and rudeness (see, e.g., Bousfield & Culpeper, 2008; Bousfield & Locher, 2008). Already in 1990, Tracy highlighted that facework does not consist only of face-maintaining behavior, but also of face-enhancing, face-damaging, and face-challenging behavior. This goes hand in hand with Scollon and Scollon’s claim (2001, p. 48) that there is no faceless communication, a point that is mirrored in the definition of relational work given above in that the entire spectrum of communication is of interest for research. This field, which is still rather young, witnesses and contributes to the same methodological discussions as “politeness research” in general.

Finally, in many cases we can note that the opening up of the type of data also shows a certain shift in interest—away from a focus on “politeness” or “impoliteness”—to a discussion of the interplay of relational issues and “identity construction.” Researchers working with concepts such as “relational work” (Locher & Watts, 2008), “rapport management” (Spencer-Oatey, 2005), and “face constituting theory” (Arundale, 2010), and also

scholars interested in identity construction more generally (e.g., Davies & Harré, 1990; Bucholtz & Hall, 2005; Locher, 2008), are ultimately concerned with the interpersonal or relational aspect of language and how it affects language choices. In order to study these choices, not only contextual factors are considered; cognitive and social-psychological insights also enter the discussion of how people negotiate interpersonal meaning in particular communities of practice. The field of “politeness” research is thus as vibrant as ever and has broadened in scope and interest.

Politeness and Face Research

STEPHEN BREMNER

Most of us have a sense of what constitutes polite behavior, and can generally recognize instances when rules of politeness are being transgressed. Indeed, politeness is a central component of social interaction, and its successful functioning is dependent on the parties involved understanding and respecting the conventions of being polite. These conventions are for the most part tacitly understood, yet are realized in the language we select as we participate in social interaction. This relationship between politeness and language has become a focus of considerable interest for linguists. As Held puts it, “the fact that politeness represents a social norm that can be observed empirically in language and reliably analyzed by means of language has long made it an important object of study in linguistics” (1992, p. 133). Eelen (2001) suggests that the study of politeness helps us to understand the relationship between language and social reality, while Lakoff and Ide talk of the possibility of politeness “as a unifying force bringing together a theory of language and theories of human motivation, behavior and culture” (2005, p. 3).

Definitions of Politeness

A number of definitions have emerged from the wealth of studies that have examined politeness phenomena, and these reveal subtly different emphases. For some researchers the key idea is that politeness serves as a means of reducing the possibility of conflict: Lakoff, for example, contends that “politeness is developed by societies in order to reduce friction in personal interaction” (1975, p. 64), while Brown and Levinson (1987) view politeness as a means of softening acts which threaten the face of interactants. Kasper, in an overview of research into linguistic politeness, explains that these perspectives on politeness see communication “as a fundamentally dangerous and antagonistic endeavor” (1990, p. 194), thus politeness would require strategies that can be used by participants in an interaction to reduce the danger and possibility of antagonism.

A slightly different point of view centers around the idea of politeness as a form of consideration for others: Sifianou sees it “as the set of social values which instructs interactants to consider each other by satisfying shared expectations” (1992, p. 86, original emphasis), while Watts defines it as “mutual cooperation in verbal interaction and as displaying consideration for other participants” (2003, p. 17). A further perspective considers the role of politeness in ensuring successful interaction, evidenced in Ide’s definition of politeness as “language usage associated with smooth communication” (1989, p. 225).

An important aspect of politeness, intimated in Sifianou’s (1992) definition, is the notion that conventions of politeness and their linguistic realizations are mutually understood by the parties involved, and that it is anticipated that each party will observe these. Essentially, then, politeness is about participants in an interaction following the rules and expecting that they will be followed.

It should be noted that the term “politeness” has a largely positive connotation in everyday language; witness the Oxford English Dictionary definition, for example: “courtesy, good manners, behaviour that is respectful or considerate of others.” In linguistic studies,

however, the term is used in a more neutral manner: Ide (1989) captures this difference very deftly, explaining that, "Just as 'height' does not refer to the state of being 'high,' 'politeness' is not the state of being 'polite,' rather it is a continuum stretching from polite to non-polite" (p. 225).

The Notion of Face

In the same way that politeness has status as a commonsense notion in our everyday existence, the idea of face appears in our everyday language, in phrases such as "face-saving" or "to lose face." It is commonly accepted that the notion of face is of considerable importance in certain Asian societies, but it is not a purely Asian preserve: indeed, according to Janney and Arndt, "a fundamental preoccupation of people around the earth is maintaining or protecting face" (1992, p. 27).

The concept of face was introduced into discussions of sociolinguistics and pragmatics by Goffman (1967), who defines it "as the positive social value a person effectively claims for himself by the line others assume he has taken during a particular contact" (p. 5). "(O)ne's face," he goes on to say, "is a sacred thing, and the expressive order required to sustain it is therefore a ritual one" (p. 19). He expects that participants in any encounter will try and behave in such a way as to maintain both their own face and that of the other participants. Similarly, Brown and Levinson, who derive their notion of "face" from Goffman, say that face needs constant attention during interaction and that cooperation is expected of all parties because of "the mutual vulnerability of face" (Brown & Levinson, 1987, p. 61).

Janney and Arndt contend that threats to face—whether intended, accidental, or even imagined—are the basis of most interpersonal conflicts (1992, p. 28). Goffman asserts that "When a face has been threatened, face-work must be done" (1967, p. 27). Facework is the set of practices that people call upon to save face, and these can have a defensive orientation, aimed at saving your own face, or a protective orientation, aimed at saving the others' face. Face is a central concept in the consideration of politeness, in that whatever perspective is taken with regard to politeness, whether it is seen as a form of conflict avoidance, or of cooperation, or as a lubricant that ensures the smooth functioning of interaction, polite behavior requires participants to attend to each other's face.

Politeness Research

There is a substantial body of empirical research into the nature of politeness and how it is realized in linguistic terms. This has been conducted in a range of cultural contexts and with a wide variety of languages, including Chinese, Japanese, Greek, Russian, Hebrew and English to name but a few. According to Watts (2003), the study of linguistic politeness phenomena in Chinese and Japanese has a long history, while in Western Europe and North America, the discipline has its genesis in the late 1960s/early 1970s. He contends that this is because linguists who were interested in the area "had little or no theoretical basis to fall back on until speech act theory appeared in the 1960s" (2003, p. 53), referring to the work of Austin (1962) and Searle (1970). In addition to speech act theory, research into politeness draws quite heavily on the work of Goffman (1967) and his notions of face and facework, explained above, and the work of Grice (1975), in particular his cooperative principle.

Grice's cooperative principle (CP) serves as a launch pad for a number of important theories and studies relating to linguistic politeness. The CP is predicated on the idea that listeners and speakers need to cooperate in order for interactions to be successful. Four

conversational maxims are proposed as part of this principle: the maxims of *quantity*, *quality*, *relation*, and *manner*. These suggest respectively that a speaker's contribution should only be as informative as is required for the purposes of the conversation, that people should say only what they believe to be true, that they should be relevant, and finally that they should be brief, orderly, and avoid ambiguity. The maxims should not be taken as prescriptive, rather they should be seen as assumptions that a listener might make about the behavior of a speaker. This echoes the point made above in relation to politeness: that participants in an interaction are involved in a cooperative process that is based on certain expectations.

Interestingly, Grice also suggested that a maxim of politeness could be added, and this, according to Watts (2003), prompted researchers like Lakoff (1973) and Leech (1983) "to formulate the missing maxim" (p. 58). Lakoff's theory proposes overarching rules of *pragmatic competence*, which consist of two elements: "Be clear" and "Be polite." "Be clear" (the "rules of conversation") is similar to Grice's CP, while "Be polite" (the "rules of politeness") has three subrules: "R1. Don't impose; R2. Give options; R3. Make addressee feel good."

Leech (1983) also builds on Grice's work; he articulates a *politeness principle*, which consists of six maxims: tact, generosity, approbation, modesty, agreement, and sympathy. According to this principle, politeness involves minimizing the cost and maximizing the benefit to the hearer or speaker, depending on the situation. The *maxim of tact*, for example, states that you should minimize the expression of beliefs which imply cost to other participants, and that you should maximize the expression of beliefs which imply benefit to them. The main purpose of this politeness principle, Leech says, is to establish and maintain feelings of comity within the group.

Brown and Levinson's Research

Eelen suggests that Lakoff, Leech, Brown, and Levinson "can be considered the founding fathers of modern politeness research" (2001, p. 23). Certainly it would be difficult, some would say impossible, to discuss politeness and theories of politeness without considering the work of Brown and Levinson, in particular their 1987 book, *Politeness: Some Universals in Language Usage*, originally published as a paper in 1978. Brown and Levinson, like Lakoff and Leech, build on Grice's CP. What they were hoping to develop, they said, was "a tool for describing . . . the quality of social relationships" (Brown & Levinson, 1987, p. 55); an important element of this aim was to build—controversially—a single universal theory that addresses politeness phenomena in different cultures: "We want to account for the observed cross-cultural similarities in the abstract principles which underlie polite usage" (1987, p. 57). The issue of the claimed universality of their theory is discussed later.

It is worth explaining in some detail the principles of their theory, given that it has become a point of reference for almost any research in the field of politeness. The theory is predicated on the notion of the model person (MP), explained as "a wilful fluent speaker of a natural language, further endowed with two special properties—rationality and face" (Brown & Levinson, 1987, p. 58). A person's face is defined as

the public self-image that every member wants to claim for himself, consisting in two related aspects:

1. negative face: the basic claim to territories, personal preserves, rights to non-distraction—i.e., freedom of action and freedom from imposition;
2. positive face: the positive consistent self-image or 'personality' (crucially including the desire that this self-image be appreciated and approved of) claimed by interactants. (p. 61)

Face wants, they say, can only be satisfied by the actions of others, which means that "it will in general be to the mutual interest of two MPs to maintain each other's face" (p. 60). Such a position, then, in common with Grice's CP, assumes that participants will adopt a cooperative approach to interacting, and will expect the same from other participants. As mentioned earlier, their work is predicated around the idea that communication is a threatening business; acts which intrinsically threaten face are known as "face-threatening acts," or FTAs. The task of the interactant is to choose an appropriate strategy for doing an FTA, and Brown and Levinson propose a set of strategies that range from "bald on-record" performance of an FTA to more redressive strategies that "give(s) face" to the addressee and "attempt(s) to counteract the potential face damage of the FTA" (p. 69). Positive politeness strategies, oriented towards the positive face of the hearer, might involve complimenting or expressing solidarity with the hearer, while negative politeness strategies, oriented towards partially satisfying the hearer's negative face, would be "essentially avoidance-based," and characterized by "self-effacement, formality and restraint" (p. 70), and might include apologies, hedges, and other softening mechanisms.

A further dimension to the model comes in the form of a set of sociological variables which are considered when assessing the seriousness of an FTA. These are the social distance between the speaker and hearer, the relative power relations between them, and the degree to which the act potentially imposes on the hearer. Consider, for example, the degree of imposition involved in asking to borrow someone's pen compared to asking to borrow their car for the weekend.

A Universal Theory of Politeness?

Brown and Levinson's work has attracted a considerable amount of comment and criticism, much of this surrounding the claims of universality that they make for their theory. A major issue relates to their contention that the choices that speakers make are individually motivated: according to some researchers their theory does not take sufficient account of the social exigencies inherent in certain cultures, particularly Asian ones. In other words the model is situated in an individualistic (for which read Western) view of culture rather than a collectivist perspective. Arundale (2006) talks in this regard of the "Western pre-occupation with the individual as the central factor in explaining human activity" (p. 195).

This issue is addressed by Kasper (1990), who distinguishes between politeness as strategic conflict avoidance (referred to above) and politeness as social indexing, which is explained as the linguistic expression of "social warrants" that accrue from attributes such as age, sex, and family position on the one hand, and rank, title, and social position on the other; as such, she says, social indexing "operates independently of the current goal a speaker intends to achieve," and so speakers are often obliged to "conform to socioculturally prescribed or permitted choices" (1990, p. 196) during interactions rather than make individually motivated choices.

Social indexing and the obligation to observe it varies considerably across cultures; in the case of Japan, for example, Ide (1989) explains "*wakimae*," a Japanese term used to describe a system of politeness determined by social norms such as being polite to older people or to people in higher social positions. Her research is based on the Japanese honorifics system, in which the speaker has to choose between honorific and non-honorific forms, thereby giving information about the speaker-hearer relationship. It is not a question of free will, she says, as with the choices enumerated in Brown and Levinson's model, but of observing what is socially prescribed. The politeness where the speaker has the choice, she calls "volition," which she contrasts with "discernment," which does not involve free will. Similarly Gu (1990) explains that the Chinese concept of politeness is linked to moral societal norms, rather than the psychological wants of individuals, saying that "Politeness is a phenomenon belonging to the level of society" (p. 242).

Thus one of the chief objections to the universality claimed by Brown and Levinson for their theory is the contention that politeness is culturally bound in some ways. However, while increasing numbers of studies make the case that the conventions and rules of politeness vary from culture to culture, the search for a universal theory goes on: Leech (2007), for example, has proposed a *grand strategy of politeness*, which he claims can explain communicative politeness phenomena in both Eastern and Western languages.

Recent research has raised further questions about the possibility of a universally applicable theory, and this relates to the interactional nature of conversation and the fact that it is located in specific contexts. Arundale argues for an interactional view of face, saying that it is “an emergent property of relationships, and therefore a relational phenomenon, as opposed to a social psychological one” (2006, p. 201). Watts (2003), who talks of the need to break with Brown and Levinson’s paradigm, sets out arguments to refute the idea of a universal, scientific concept of politeness, saying that polite behavior cannot be evaluated out of context, and that any theory has to take into consideration the perspectives of speakers and hearers, whose behavior during any interaction is open to modification as it progresses; on the basis of this he contends that it is not possible to develop a predictive model of linguistic politeness. Meanwhile Eelen, who provides an extensive review and critique of politeness theories, sees his revision of the notion of politeness as representing “a turn towards a firmer embedding of politeness within the dynamics of social reality” (2001, p. 257). It can be seen, then, that the field is still developing in theoretical terms, particularly as researchers investigate politeness in an increasingly broad variety of cultural settings and take into account the features of specific contexts.

Other Areas of Politeness Research

Over the last 20 or 30 years a vast amount of research into politeness has been produced, particularly comparing politeness across cultures. It has been observed that there is little discussion of impoliteness (Eelen, 2001), a notable exception being the work of Culpeper (1996). There is a considerable body of research that focuses on the relationship between power and politeness; another important area that has been examined is the issue of politeness and gender, Lakoff’s (1975) work being one of the better known studies. Finally, although the bulk of politeness-based research is based on spoken data, there is a growing number of studies that use written data, particularly from workplace settings.

The examination of politeness and face presented here has attempted to describe how this area of research has developed, taking in the major studies and theoretical issues along the way. However, it can only scratch the surface of what is a huge body of discussion and research, which has grown rapidly and, given the centrality of politeness in our daily interaction, has rightly assumed considerable importance in applied linguistics.

Politeness in Computer-Mediated Communication

CARMEN TALEGHANI-NIKAZM

Computer-mediated communication or CMC refers to a rapidly growing means of online communication through which people interact with each other by language, usually typed on a keyboard and read on a computer screen. CMC includes chat, computer messages, e-mail, computer conferencing, forums, and online bulletin boards. Some communication modes, such as chat, computer conferencing, and computer messages, allow people to interact in real time (i.e., instant messaging), while others are rather fixed in terms of the response time. CMC has become an important part of our daily lives and participants increasingly use this medium to establish and maintain social relationships. In comparison with face-to-face conversation, CMC represents a modified speech exchange system where physical bodies, and paralinguistic cues such as intonation, facial expression, and gesture are not available. In the past 20 years, researchers and educators have become particularly interested in this new medium and how it influences language use. While focusing on the similarities and differences between features of ordinary conversation and online communication, these studies have analyzed and described the ways technological constraint limits the interactional resources, the linguistic choices participants make when communicating via CMC, and the ways they adapt their language to the new medium (Jones, 1995; Herring, 1996, 2002; Harrison, 2000; Schönfeldt & Golato, 2003). Some studies focused on sociological or sociolinguistic aspects such as gender, community, and identity (Jones, S. 1995; Jones, Q., 1997; Baym, 1999) in e-mail communication (e.g., Herring, 1996), Web discussion boards, and Web chats (Baym, 1999; Herring, 1996), whereas other studies examined mainly linguistic elements of CMC and comparing the language used in CMC with oral and written forms of communication (Jones, 1997; Herring, 2001). Other groups of studies explored how CMC might be used effectively for pedagogical or business purposes (e.g., Al-Shalawi, 2001).

Politeness Theory and CMC

Interest in language use in CMC and strategies participants use in establishing and maintaining social relationships led scholars to a particular area of investigation, namely politeness. The concept of *politeness* refers to rule-governed strategies through which interpersonal relationship and harmony can be achieved and maintained (Lakoff, 1973; Brown & Levinson, 1987). It is face-work that underlies the interpersonal function of language use. The concept of face, as in *losing* or *saving face*, can be seen as positive social value that one can claim during a particular social interaction (Goffman, 1967). One of the most influential and productive studies on politeness and its variations is Brown and Levinson's politeness theory (1987). According to this theory, speech acts such as disagreement, requests, refusals (for example) pose a threat to face—that is, public self-image—which is unavoidable in everyday social interaction. In order to avoid threatening each other's face, and to maintain and enhance a harmonious social relationship, speech participants employ verbal and nonverbal politeness expressions and practices when interacting with

one another in face-to-face settings. Utilizing the notion of face (Goffman, 1967), Brown and Levinson (1987) propose a dual nature for *politeness: positive politeness* and *negative politeness*. Positive politeness is expressed by satisfying *positive face* by indicating similarities amongst interactants or by expressing an appreciation of the interlocutor's self-image. Negative politeness, on the other hand, involves saving the interlocutor's face by mitigating face-threatening acts (FTAs), or by satisfying *negative face*, which indicates respect for the addressee's right not to be imposed. In their view, participants in an interaction select from a set of politeness strategies that enable them to either avoid or minimize face-threatening activities. Brown and Levinson (1987) suggest that the more threatening an act is the more polite and indirect are the means used to accomplish it. In addition to positive and negative politeness theory, Brown and Levinson (1987) propose three social and interpersonal variables that affect realization of politeness during interpersonal relationships among interactants, namely *power*, *distance*, and *imposition*. Hence maintaining and promoting face depends on the speaker's cognitive assessment of these social variables. When the speaker perceives an asymmetrical power difference and greater sociopsychological distance from the hearer and a greater imposition, they tend to be more polite.

Employing Brown and Levinson's (1987) politeness theory, some researchers have conducted studies on politeness in CMC in Western and non-Western language, examining interaction in everyday settings (Dorta, 2008), institutional settings (Harrison, 2000; Westbrook, 2007), and in pedagogical contexts (Chen, 2001; Al-Shalawi, 2001; Biesenbach-Lucas, 2007; Park, 2008). Overall, research has shown that politeness plays a major role in participants' construction of their discourse. Speakers utilize linguistic strategies used in face-to-face conversations and when necessary design their own innovative nonlinguistic politeness to avoid and reduce social friction and to enhance each other's face during online communication. Furthermore, these studies have demonstrated that, depending on participants' cognitive assessment of interpersonal variables such as social *distance* and *power* difference between the participants and the *weight* of imposition, participants employ verbal and nonverbal devices to manage online face-work.

As noted, overall studies on online communication and politeness behavior in CMC (e-mail, synchronous chat, Web discussion board) found some differences and similarities in linguistic and nonlinguistic politeness features that are utilized by interactants in both media. For example, it has been suggested that unlike in face-to-face conversation, depending on the topic and setting participants in CMC may frequently employ direct forms of speech acts (e.g., *What's the topic?*) and that this speech style (i.e., short and concise) can be contributed to the participants' need to follow the stream and speed of the real-time conversation in synchronous mode of communication (Dorta, 2008; Park, 2008). However, this research has also shown that, similar to face-to-face conversation, participants regularly employ positive and negative politeness strategies in online communication. For instance, studies have demonstrated that participants frequently use positive politeness strategies such as seeking common ground by expressing shared background knowledge, interest, or experiences which may enhance positive interpersonal relationships and increase social proximity and solidarity among participants (Westbrook, 2007; Dorta, 2008; Park, 2008). Examples of negative politeness strategies similar to face-to-face interaction that were found in online communication include apology, conventional indirectness (*could you . . .*), politeness discourse markers such as *please*, and hedges, that is, words that modify or mitigate the force of a speech act (Lakoff, 1973) (e.g., *I think, sort of, like, well, you know*). These are all devices that contribute to softening and mitigating the force of face-threatening acts, such as disagreement and request (Harrison, 2000; Al-Shalawi, 2001; Westbrook, 2007; Dorta, 2008; Park, 2008).

As stated earlier, in CMC physical bodies and paralinguistic cues (such as intonation, facial expression, and gesture) are not available as they are in face-to-face conversation.

It is well known that in face-to-face conversations interactants employ various nonverbal devices such as nodding, eye contact, intonation, and facial expressions to indicate interest, understanding, or confusion. These nonverbal communication cues work to align and modify speech participants' verbal exchanges. Consequently, nonverbal communication devices function to enhance and promote communication flow and progress. They also help participants to convey different sociocognitive and emotional meanings. Studies of online communication and politeness have shown that nonverbal communication is quite common among online language users. It has been noted that participants have developed creative devices to bring nonverbal communication commonly used in face-to-face conversation into online communication and thereby to overcome the constraints that the CMC channel imposes on online users (Carter, 2003; Golato & Taleghani-Nikazm, 2006; Park, 2008). More specifically, it has been shown that participants employ a variety of novel linguistic and paralinguistic devices to express interpersonal and affective stances in online communication. These devices include contractions of linguistic forms, abbreviations (*lol*: laughing out loud, or *OMG*: Oh my god), typographical conventions such as capital letters (to signify intense attention to the recipient), shorthand or informal abbreviations (*me2*, *ic*), and emoticons (for example, the so-called *smiley face*, *sad face*, or *a flower*) to simulate gesture and facial expressions.

In terms of *positive politeness*, it has been noted that because of the simplified syntactic structures, colloquialisms, and spelling changes reflecting spoken language, chat logs, in particular, often read almost like a transcript of spoken language (Herring, 1996; Reed & Ashmore, 2000). Researchers attribute this informal speech style in CMC (particularly in chat exchanges) to speakers' *positive face* desire—in other words, to be liked and appreciated. More specifically, it has been suggested that informality increases the use of solidarity-oriented linguistic forms and thereby decreases social distance and promotes a positive atmosphere for interpersonal relationships (Harrison, 2000; Park, 2008).

Politeness Strategies and Social Variables in CMC

In addition to analyzing the ways politeness is realized linguistically and nonlinguistically in online communication, some researchers have examined the ways that politeness strategies are systematically related to variables of interest in CMC research, such as status, impersonality, friendship, and communicative efficiency. Herring, Johnson, and DiBenedetto (1995) examined online discussion groups with respect to politeness and gender and investigated whether women and men exhibit different patterns of online participation in terms of amount, frequency, and manner of posting. In addition, Herring et al. supplemented their study by an anonymous survey on Net etiquette: what constitutes appropriate and inappropriate behavior on the Internet. Herring et al.'s (1995) results of investigation revealed that women and men access appropriateness differently. While women value politeness and generally behave politely on the Internet, men operate in accordance with other values, namely agonistic debate and freedom from censorship, which supersede politeness and result in violations of conventional politeness norms. Herring et al. (1995) based their study on Brown and Levinson's politeness theory (1987) and demonstrated that men commonly post longer and more frequent messages than women do. They also post more messages that are contentious or adversarial in tone, or overtly hostile, and make greater use of sarcasm. In contrast, women post short messages, contribute more overt expressions of agreement, appreciation, and support, and apologize more often.

Investigations of politeness in non-native speakers' (learners of English) e-mail interaction with faculty (native speakers) revealed that the difference between native speakers' and non-native speakers' e-mail interaction is in the presence of multiple *phatic* expressions

in the non-native speakers' messages (Bloch, 2002; Biesenbach-Lucas, 2007). Phatic communication refers to messages that do not carry real information, but are predominantly used to maintain social relationships (Malinowski, 1923). On the other hand, a comparison of native and non-native speakers' requests (for appointments and recommendation) produced in e-mail exchanges with their professor revealed that both groups of students preferred formulations such as *can you . . .* and want statements such as *I want/would like to* in order to realize their requests. The study also showed that the two groups differed in types of politeness devices they utilized when making requests via e-mail exchanges. For example, the comparison revealed that the lexicosyntactic politeness features (e.g., use of past tense) made the native speakers' requests indirect (e.g., *could you/would you*) and more polite (Chen, 2001; Biesenbach-Lucas, 2007). It is worth mentioning that Biesenbach-Lucas's (2007) investigation showed that native speakers' requests were not overly mitigated with politeness strategies, suggesting that in the e-mail medium, a minimum amount of modification may be considered sufficient for realizing students' requests of faculty. This may be understood as an attempt at message economy and clarity (Biesenbach-Lucas, 2007). Overall, it has been suggested that politeness conventions in e-mail, a text-only medium with little guidance in the academic institutional hierarchy, appear to be a work in progress, and native speakers demonstrate greater resources in creating e-polite messages to their professors than non-native speakers (Baron, 1984; Herring, 2002; Biesenbach-Lucas, 2007).

Conclusion

In general, studies on politeness and CMC have found evidence for different ways participants adjust their verbal and nonverbal practices when dealing with face management issues to suit the particular condition of the medium. The studies mentioned in this entry focus on modified discursive exchanges and politeness behavior in CMC where nonverbal and paralinguistic features are not available to the participants. These studies and their results have made an important contribution to our understanding of interpersonal communication that is critical to the fostering of successful interaction and collaboration. There have also been other more recent forms of CMC such as ICQ and Messenger Video that provide a video chat feature to the online communication. These multi-user synchronous video chat programs are becoming popular not only for everyday usage but also for educational purposes. Educators have become particularly interested in using chat video programs as a way to encourage and extend educational dialogue between students and instructors. Recent research has mainly focused on the suitability of this new form of CMC for teaching purposes rather than on linguistic and politeness related issues (Sadler, 2007). More research is required to explore the linguistic and paralinguistic politeness features utilized by participants when interacting via synchronous video chat programs.

Positioning in the Analysis of Discourse and Interaction

RODNEY H. JONES

Introduction

Positioning theory is a framework for analyzing the negotiation of identity in interaction chiefly associated with the psychologist Rom Harré, and his colleagues (Davies & Harré, 1990; Van Langenhove & Harré, 1999). The idea of positioning originally grew out of problems arising from the inadequacy of the concept of “role” in social scientific discussions of identity.

Whereas “roles” are usually conceived of as static and unitary, the notion of positioning is better able to capture the dynamic and contingent nature of identity in social encounters. “Who one is,” according to Davies and Harré (1990, p. 46), is not static. It is “always an open question with a shifting answer depending upon the positions made available within one’s own and others’ discursive practices and within those practices, the stories through which we make sense of our own and others’ lives.”

The interactional notion of positioning advanced by Harré and his colleagues also contrasts with the more rigid view of positioning advanced by Marxist-inspired media critics like Althusser (1971), for whom media texts are seen to have the power to “position” subjects in a way that advances the ideological agenda of particular groups. While ideology is also an important fact of Harré’s approach, it is seen more as a tool for social action than as a determinant of it. While social actors are constantly being positioned by discourse, they also have the ability to resist or contest these positionings.

Positioning, then, is essentially a discursive process through which people negotiate their own and others’ identities in interaction by portraying themselves as “characters” in jointly produced narratives. In this approach to positioning, there are basically two kinds of positioning: interactive positioning, in which people position each other, and reflexive positioning, in which people position themselves.

Positioning theory has become an important analytical tool in interactional sociolinguistics (see for example De Fina, Schiffrin, & Bamberg, 2006), where, along with “framing” (Goffman, 1974), “footing” (Goffman, 1981), and “stance,” it is used to explore ways in which participants in conversation strategically manage their identities and their jointly produced definition of “what’s going on.” However, the more general concept of positioning, apart from the specifics of the theory developed by Harré and his colleagues, is central to other schools of discourse analysis as well, particularly feminist poststructuralism (Weedon, 1997; Baxter, 2003) and discursive psychology (Potter & Wetherall, 1988), which are similarly concerned with the ways in which, when they engage in social interaction, individuals become the “*site* and *subjects* of discursive struggle for their identity” (Weedon, 1997, p. 93) in which subject positions are variously assumed, imputed, negotiated, contested, and rejected.

The Positioning Triad

For Harré and his colleagues, positioning is seen as the consequence of the mutually constitutive relationship of three elements—positions, story lines, and speech acts—which together constitute what they call the “positioning triad.” The primary unit of analysis in Harré’s positioning theory is the *speech act*. However, whereas in the classic formulation of speech act theory the illocutionary force of a speech act is determined chiefly by the intention of the person who issues the speech act, in positioning theory participants in interaction are seen to *act jointly* to produce speech acts, and the force of these speech acts depends upon the *positions* participants have assumed within cooperatively constructed narratives of what is going on (*story lines*). At the same time, these *story lines* and the *positions* made available to participants within them are constructed and maintained through the *force* of the various speech acts participants produce. This relationship between *story lines*, *positions*, and the *force* of speech acts is what constitutes the *positioning triad*.

Story Lines

The notion of the story line is perhaps positioning theory’s most unique contribution to the analysis of social interaction. It gives the analyst a way to link the micromanagement of ongoing interaction with the personal histories of participants and the master narratives of their cultures. The basic idea is this: Whenever we interact, the meaning and the “force” of what we say are interpreted within the context of the various “stories” and “histories” that we bring to the interaction or that we “make up” together with other participants as we go along. Some of these stories have to do with our past experiences with the particular people with whom we are interacting. Others are attached to our personal histories apart from those people—our own biographies. Finally, there are stories that are generated by our culture, mutually shared “master narratives” about what sorts of things are supposed to happen in different situations and what kinds of behavior certain kinds of people are expected to display. These “cultural story lines” are usually associated with different “discourses” (such as the “discourse of romantic love” or the “discourse of medicine”). “Cultural story lines” can have a particularly powerful effect on interaction, though participants themselves are often unaware that they are drawing upon them to formulate their actions and interpret the actions of others.

Every conversation, then, is essentially a process through which participants jointly tell stories. These stories are almost always multiple, and interact with one another as they develop. They serve both as resources that participants draw upon to organize and make sense of their interaction and the key mechanisms that individuals use to construct themselves as “observably and subjectively coherent” individuals (Davies & Harré, 1999, p. 37).

Positions

The various story lines that people draw upon and co-construct in interaction make available different “parts” or characters which people can take up for themselves and compel others to assume. These characters are different from “roles” in several important ways. First, they are often predicated on assumptions not just about the kinds of actions that a person is supposed to take up within a particular activity, but also about that person’s relative power and standing in relation to other participants, their abilities, their personalities, and their moral characters. Second, the positioning of the self and others as characters in shared story lines is seen as more dynamic and ephemeral than the assumption of “roles,” involving the constant potential for shifts in power and status and for the negotiation of character and personality traits.

Participants in interaction, by drawing upon or invoking a particular story line and taking up for themselves the position of one particular character in it, inevitably make available to other participants specific subject positions or characters, which, because of the cooperative nature of conversation, they are usually compelled to take up. It is, however, possible for one to resist or challenge the position that another person has made available to him or her by, for example, attempting to claim the position of a different character in the same story, offering an alternative version of the story, or contesting the legitimacy of the story altogether. In most cases, however, when people fail to conform to the positions that others have made available to them it constitutes some sort of disruption in the interaction which requires comment or repair.

By claiming positions in particular story lines and imputing positions onto others, participants in conversations do not just cooperatively construct frameworks in which conversational contributions can be interpreted; they also set up "moral orders" (Davies & Harré, 1990) within interactions in which participants are seen in various ways as responsible for their own or others' actions and the consequences of these actions.

Force

The final component in the positioning triad is the force of a particular speech act. In traditional speech act theory, the force of a speech act depends upon it meeting certain "felicity conditions" regarding the person who issues it, the person to whom it is issued, and the circumstances in which it is issued. In positioning theory, the force of a speech act depends upon the position that the person who issues it has taken up in a particular story line. What might be taken as a "suggestion" in a story line involving colleagues collaborating on a project, for example, might be seen as an "order" in a story line involving a boss directing his or her subordinates.

At the same time, the force of speech acts themselves constructs and reinforces story lines. By responding to a "complaint" with a "suggestion," for instance, the second speaker positions the first as "asking for advice," and, by treating an utterance as a "condolence," the second speaker positions him- or herself as a victim of some misfortune.

To further complicate things, since conversations almost always involve multiple story lines, the same utterance can be used to perform different speech acts within these different story lines. Anybody who socializes with their superiors from work, for example, is aware of the potentially multiple ways a "friendly suggestion" from the boss might be taken.

Positioning and Strategic Interaction

The analytical power of positioning theory lies in its ability to explain not just how participants in conversations discursively construct themselves and others as characters in story lines, but also how they can use these positions and stories as resources for strategic interaction. Because interaction typically involves multiple story lines, participants usually have available to them multiple positions that they can sometimes strategically adopt, contest, and play off one another. A mother, for example, might shift between the positions of her child's "friend," "teacher," and "parent" when attempting to cajole the child into doing something. This potential for strategic action is particularly relevant in interactions in which individuals with relatively less power attempt to resist, subvert, or adapt to a relatively powerless positioning in one story line by adopting a more powerful one in another (Baxter, 2003; Preece, 2009).

Positioning can also be used strategically in order to assume or deny responsibility for various actions and happenings. All positions have built into them various levels of

intentionality and responsibility. The position of a “victim,” for example, constructs a person as having less agency than the position of a “perpetrator.”

Of course, since people are not always consciously aware of the story lines that govern their interaction and the positions they adopt and compel others to adopt in those stories, positioning can also be a major cause of misunderstanding in interaction. In some cases, for example, participants can be drawing upon very different narratives without realizing it, or people can be swept up in the power of particular story lines and their associated positions in a way that they find difficult to resist.

Positioning, Frames, Footing, and Stance

Because of its association with strategic interaction and its adoption in interactional sociolinguistics, positioning theory is often used in conjunction with other concepts such as “framing,” “footing,” and “stance.” It is, therefore, necessary to clearly distinguish positioning and its conceptual components from these other analytical tools.

“Framing,” as it is used in interactional sociolinguistics and discourse analysis, refers primarily to the use of interpretive frameworks to make sense of situations. According to Goffman (1974), we adopt various “frames” in interaction in order to interpret and to signal to others “what’s going on”; for example, an exchange might be “framed” as “playing,” or as “arguing,” or as “flirting.” While positioning may involve framing, they are very different kinds of processes. Whereas frames tend to signal unitary activities, story lines refer to ongoing strips of action that might involve multiple activities. Thus, positioning theory provides the means to consider not just “what’s going on” in a particular interaction but also where the interaction seems to be heading and what kinds of choices participants might have as it unfolds. Furthermore, while frames tend to be more socially determined based on a finite set of activities and occasions recognized by a particular culture, positions and the story lines within which they are situated are more variable and contingent. While they might be based on culturally recognized archetypes, they also crucially depend on personal histories, relationships, and experiences.

“Footing” is related to framing in that it refers to the positions that we take up in relation to the frames which we have activated or “keyed” in an interaction. As Goffman (1981, p. 128) puts it, “A change of footing implies a change in the alignment we take up to ourselves and to the others present as expressed in the way we manage the production and reception of an utterance.” In one respect, “footing” can be thought of as having a similar relationship to “frames” as “positions” have to “story lines.” Like positioning, “footing” is seen as dynamic and negotiated. At the same time, the concept of “footing,” insofar as it refers to the positions that speakers take up in relationship to their utterances (*principal, author, or animator*), has the potential to contribute an important tool to positioning theory: the means by which to consider the relative responsibility people take for the story lines that they contribute to producing.

The concept of “stance” is in some ways similar to “footing” in that its focus is on participants’ relationship to what is said. “Stance,” however, is very different from “position” in that stance generally has to do with a person’s attitude toward, feelings about, level of commitment to, or degree of belief or trust in what is being said or what is going on, whereas one’s position is more focused on one’s relationship with other participants and the range of behavioral choices that are available to one. Thus, a particular “stance” can be seen as part of or associated with particular positions, and it is even conceivable that, by displaying a particular stance, a participant might be cueing a particular story line and taking up a particular position within it. Similarly, positioning can also be used as a resource for signaling a particular stance (Haddington, 2007).

Applications

Given the analytical power and flexibility of positioning theory, it is not surprising that it has been productively applied to the analysis of all sorts of private and public interactions from quarrels within relationships to news interviews (Haddington, 2007). With its focus on story lines, it particularly lends itself to studies of narrative in interaction, as can be seen in Bamberg's (2004) study of how teenagers negotiate identity through the telling of "small stories" and Wortham and Gadsden's (2006) exploration of how fathers use narrative to position themselves within and outside the family unit.

Positioning theory has also been applied productively to the study of contexts in which the strategic negotiation of power and status is seen to be important. It has been used extensively, for example, in studies of language and gender (see for example Georgakopoulou, 2007). In addition, Preece (2009) has used positioning to examine how so-called "remedial" students in universities strategically counter institutional positionings by adopting powerful positions within alternate story lines associated with peer groups, their families, or their communities.

Positioning theory also has the potential to improve our understanding of how people negotiate health and risk. Jones (2010), for example, uses it to analyze the ways participants in an online forum for gay men position themselves in relation to personal stories of unsafe sex and larger cultural story lines about AIDS, sexual risk, and romantic love.

Finally, as Talamo and Ligorio (2001) have pointed out, positioning theory is uniquely suited to the analysis of online interaction and the construction of "cyber-identities," which are often, even more than identities in face-to-face interaction, highly contingent, negotiated, and context-dependent.

Positivism and Postpositivism

ALBERT WEIDEMAN

Positivist and postpositivist influences in applied linguistics are discernible both directly and obliquely, as has been the case in other fields. Those influences provide evidence of how closely applied linguistic concept formation relates to developments in scientific thinking in general, as well as to specific discussions in the philosophy of science.

Positivist influences derive from the ideas of Comte and his 19th-century contemporaries, who sought to bring the methods of the natural sciences, and specifically the “positive” method of mathematical analysis, to bear on the examination of social life. The expectation that natural scientific methods would give the ultimate answers continues to provide the justification for all modernist approaches to applied linguistics that will be discussed below. The notion of “logical” positivism, in turn, was made prominent by a later, 20th-century variant, sometimes referred to as neopositivism, and associated with the Wiener Kreis, an academic circle that included Carnap. The term refers to the logical empiricism they practiced, which entailed a commitment to the experimental method, based on sensory perception.

A counter-trend to positivism was already evident in the work of Popper and others. Popper proposed a critical rationalism that acknowledges that the belief in rationality is itself not rational (Strauss, 2004, p. 5), but, as Stegmüller has pointed out, it fell to Kuhn’s (1962) groundbreaking analysis to challenge truly the falseness of the positivist belief in the cumulative increase in knowledge (Strauss, 2004, p. 6). This paved the way for Feyerabend’s (1975) theoretical anarchism, which allowed a methodology of mutually incompatible alternatives (p. 30). Its postpositivist critique of Western science underlies the postmodernist reliance in applied linguistics on a plurality of perspectives and on a recognition of the paradigmatically and ideologically inspired differences (Feyerabend, 1975, p. 274) in the designs it produces.

Positivism/postpositivism is one of several kinds of categorization that can be used to characterize applied linguistic designs. It serves, in addition, as a kind of shorthand for a more wide-ranging characterization in all of the humanities: the contrast between quantitative and qualitative approaches (cf. Richards, 2009). In the first, the emphasis is on empirical facts, particularly as these are expressed in numbers. In the second, it is the idea that our observations need not only interpretation, but also sometimes political analysis and action. It overlaps substantially with the categorization “modernist” and “postmodernist,” which reflects the traditional extremes within applied linguistics, as well as the various competing paradigms utilized in its short modern history. Kumaravadivelu (2006, p. 11) uses the terms interchangeably, describing as postmodern a framework that runs counter to the “positivist, prescriptive research paradigm” that is characteristic of modernist approaches. There is really no way to clarify and reconceptualize these closely synonymous ideas in a way that will “set us straight” for now or for the future. Applied linguists are likely to continue to use them interchangeably, while heeding the necessity of paying deliberate attention to the philosophical roots of their own training.

A Discipline of Design

Applied linguistics is best characterized as a discipline of design (Corder, 1972, p. 6; Cope & Kalantzis, 2000, p. 7). For both modernist and postmodernist interpretations of the field, it is an endeavor that allows professionals to conceive, plan, and develop designs that address language-related problems. The designs applied linguists bring to bear on the initializing language-related problem usually come in the form of a language *policy*, a language *test*, or a language *course*. This in itself does not make them applied linguistic artifacts: They also need to be justified with reference to some adequate theoretical approach.

The different styles of working professionally within the discipline derive their uniqueness from the theories that underlie various paradigms of applied linguistics. So the expectation, especially in early, modernist approaches to applied linguistics, is not surprising: that “scientific” grounding will deliver the ultimate plan. The main difference between positivist and postpositivist approaches to applied linguistics lies in the expectations they create. Postmodern approaches not only call the certainty of being able to obtain a scientific solution to a language problem into question, but actively oppose it (Pennycook, 2004).

Historically Variable Modes of Applied Linguistics

Such distinctions (positivist or postpositivist; modernist vs. postmodernist) as conceptualizations of the field refer in the first instance to historically variable and sequential paradigms or styles of doing applied linguistics. Applied linguistics harbors seven such traditions or modes of work (Weideman, 2009, p. 62) (see Table 1).

Linguistic Conceptions of Applied Linguistics

The first two modes of doing applied linguistics in Table 1 constitute *linguistic conceptualizations* of the field. Initially, applied linguistics was considered as nothing more than an extension of linguistics. The underlying premise was that of a simple continuity between linguistics and applied linguistics. In terms of the modernist and positivist starting points of this historically first style of doing applied linguistics, that continuity was necessary to

Table 1 Seven successive traditions within applied linguistics

<i>Paradigm or tradition</i>	<i>Characterized by</i>
1. Linguistic or behaviorist	“Scientific” approach
2. Linguistic “extended paradigm model”	Language as a social phenomenon
3. Multidisciplinary model	Attention not only to language, but also to learning theory and pedagogy
4. Second language acquisition research	Experimental research into how languages are learned
5. Constructivism	Knowledge of a new language as interactively constructed
6. Postmodernism	Political relations in teaching; multiplicity of perspectives
7. Complexity theory	Language emergence as organic and nonlinear, through dynamic adaptation

provide scientific credibility to applied linguistic solutions. The conception by linguists of the audio-lingual method as a scientific method of language teaching is one example of the modernist undertow associated with this tradition. Another example is to be found in the contrastive analyses of target language and first language. Such essentially linguistic analyses would focus intervention designs on the problems, the differences between target and first language. In the positivist perception of science and technology, science leads to the most authoritative solution. A good illustration of such expectations can be found in the claim by Wilkins (1975, p. 208) that by “studying language in as scientific a manner as possible we should be able to make change in language teaching a matter of cumulative improvement.”

Second generation applied linguistics extended the linguistic basis of the discipline, leading to a consideration of larger, socially relevant units of language, such as text, discourse, and register, and the mastery of these by language learners to achieve communicative competence in a target language. Yet this conception of applied linguistics remained closely allied with the modernist roots of the field.

The Grip of Linguistics Is Loosened

In the third tradition of doing applied linguistics, the *multidisciplinary* model, the realization began to dawn that the complexity of language problems called for more than linguistic attention. So, in addition to taking into account the broadened perspective on language, as suggested by second generation applied linguistic work, this tradition drew attention to two other potentially useful source disciplines: psychology and pedagogy (cf. Van Els, Bongaerts, Extra, Van Os, & Janssen-van Dieten, 1984). From psychology, applied linguistic designs for language teaching could potentially gain knowledge of how languages are learned. From pedagogy, it could possibly find out which teaching styles are most effective.

The importance of this tradition to the history of applied linguistics lies first in the insight that designs should consider more than linguistic issues (Johnson, 1969), thus loosening the monopoly that linguistics had on their justification. Second, it created awareness of multiple perspectives.

Third generation applied linguistics may have loosened the hold of linguistics on the discipline, but it did not escape the grip that positivism had. At best, it aimed at doing design work for solving language problems more efficiently and effectively, still firmly in the modernist idiom.

A Fourth and Fifth Tradition of Doing Applied Linguistics

Multidisciplinarity did not, however, come fully into its own in the mid-1980s, since for many there was more exciting work to be done in *second language acquisition research*. Stimulated initially by Chomsky’s positing of a language acquisition device, and subsequently by communicative language teaching becoming the mainstream design rationale for language teaching, the field saw increasingly sophisticated work on how languages are learned—and, importantly, how they are learned in the classroom. One enduring line of research that began in the mid-1980s has specifically investigated language learning gains when information gap techniques, characteristic of communicative language teaching and its offshoots, are used. Furthermore, frequent surveys began to appear that summarized findings that might be useful for the design of interventions, but always with a cautionary note not to expect too much (Tarone, Swain, & Fathman, 1976; Lightbown, 2000). The instructional design of a variant of communicative language teaching, called task-based language teaching, has prompted the continuation of these studies, often with the additional

complication of whether and how to do corrective feedback (e.g., Russell & Spada, 2006). The kinds of analyses surveyed show a clear bias toward quantitative data and, therefore, modernist starting points.

A fifth tradition of investigating and analyzing language learning in the classroom, *constructivism*, has developed alongside of fourth generation work. Finding its origins in Vygotskian perspectives on how language learning takes place when meaning is co-constructed by participants, constructivist explanations provided a belated theoretical justification for communicative language teaching. In South Africa, constructivism also provided applied linguists with the basis for a critical examination of language policies in education (Macdonald & Burroughs, 1991). Constructivism continues to exert some influence in the theoretical justification of course designs. Its analyses of learner talk show how learners and teachers use cognitive strategies to accomplish language learning. Fifth generation applied linguistics also began to show a possible alternative to positivist modes of thought and design. By the early 1990s the time was ripe for an important shift in applied linguistics.

Political and Social Considerations Come Into Play

The adoption of *postmodernist* styles of doing applied linguistics constitutes an important turning point. Postmodernism took the field beyond positivism for the first time. At the same time, the emphasis in third generation applied linguistics on multidisciplinary work did much to pave the way for a postmodern perspective. The postmodern tradition does not rely on a single view of academic endeavor and research—especially not on a positivist one—but acknowledges that there is a multiplicity of possible perspectives in the investigation, for example, of language teaching problems. The first challenge in the postmodern perspective is to identify the conflicting and consensual aspects of such investigations.

Its further challenge lies in identifying the political dimensions of possible sites of contestation, such as language education. In the face of rigorously prescriptive syllabuses and textbooks, applied linguists began to ask: Are learners and teachers not left powerless, especially when those language teaching designs are supposedly backed by scientific research and powerful publishing interests? Whose authority can be invoked to legitimate the introduction of new language teaching arrangements (curricula and textbooks) on a national scale, especially in poor, donor-dependent countries? What does the predominance of English as an international language do to the teaching of the languages of the politically powerless?

Such questions paved the way for accountability being required for applied linguistic designs (cf. Pennycook, 2004; Kumaravadivelu, 2006). Postmodernism placed potentially and actually abusive, exploitative practices on the agenda.

In addition to this forthright political emphasis, postmodern applied linguistics also harbors a milder strain, as is evidenced in ethnographic analyses of problematic language contexts. Through “thick” description of these contexts, and by identifying the congruent moments from a diversity of perspectives, the ethnographic investigation attempts to build as rich a picture as possible, so that generalizations that are helpful in interpreting the learning can emerge. This interpretive dimension is a defining characteristic of ethnographic research (Nunan, 1992, p. 57).

Both the milder and the politically more radical strains of postmodernist applied linguistics are thoroughly anti-positivist. Yet this does not mean that positivism has been conquered for all time.

Beyond Postmodernism: An Emergent New Paradigm

A *complex systems approach* has emerged as a seventh paradigm of doing applied linguistics (De Bot, Lowie, & Verspoor, 2007; Larsen-Freeman & Cameron, 2008). In proposing alternative explanations for language growth and development as the outcome of complex interactions among a multiplicity of systems, this approach presents a serious challenge to earlier, generativist accounts of language learning.

It sees change—interpreted as dynamic, ongoing, organically inspired and emergent growth—as the essence of what we observe in language. Similarly, language development is neither linear nor predictable, explaining why, in some language learners, we have retrogression instead of progress. In its preparedness to adopt mathematical or computational modeling as a valuable analytical tool (Beckner et al., 2009, p. 12), some will see a clearly technocratic style at work. In addition, a complex systems perspective has links with the natural sciences, as is evident from its emergentist and biotic starting points.

This seventh style of applied linguistics is, nevertheless, clearly not a revival of old-style positivism, though some working in the previous tradition will be fearful that the political agenda that they have been pursuing is ominously absent from its discussions at present. It has, however, taken us beyond postmodernism.

The Coherence of the Field

There are at least two problems associated with describing applied linguistics in terms of a series of successive traditions or styles of work. The first is that it emphasizes discontinuities more than continuity, and this can never be entirely accurate, historically. Indeed, there are uniquely different traditions of doing applied linguistics, and they have successively entered upon the historical stage. At the same time, however, they undeniably exhibit historical continuities. Thus second generation work broadens the basis of first generation work, by opening up perspectives on language that go beyond structure, form, and sound. Likewise, the multidisciplinary work in the third tradition of applied linguistics clearly foreshadows the multiplicity of perspectives so important to sixth generation work in postmodernist applied linguistics, as well as in the transdisciplinarity of a complex systems approach.

The second difficulty is that, in the actual work of designing their artifacts, applied linguists sometimes continue to adhere to the styles in which they were trained, and even mix different traditions. We cannot in reality enforce a strict separation of, for example, positivist and postpositivist traditions in applied linguistics. In short: Many styles of applied linguistics exist simultaneously and side by side. Some older styles endure because they are entrenched within institutions or in influential publishing interests.

So the actual picture is messier than the one presented above. But there has been and will be succession in dominant paradigms, and the recent arrival of seventh generation work is another reminder that domination by a single paradigm remains unlikely.

Postcolonial Studies

ISMAIL S. TALIB

Terminological Issues

There is a certain unexplained aura that is associated with the word “postcolonial,” and trying to explain what it means results in the acknowledgment either that it has a growing open-ended collection of meanings, or that what it means in specific contexts is banal and less complicated than what seems to be the case on the surface, and another term might do just as well. Arguably, the fashionable term is used either in a vague but fascinating sense, or in a specific but perfunctory sense. The former, captivating as it is, is prone to controversy, while the latter, humdrum as it may be, is less contentious, even if it is lacking in theoretical sophistication. Much of this entry will deal with the former, which is clearly more predominant. The latter is easy to define, at least superficially, as it is a simple historical specification of the postcolonial as the period after colonization.

The difference between the two postcolonial senses is reflected in the question of whether the word should be hyphenated. Should it be “post-colonial” or “postcolonial”? This variation is not merely a reflection of a historical trend in English orthography—of a tendency of hyphenated words in English to lose their hyphens—as it is likely that the hyphenated usage will continue and will exist side-by-side with the non-hyphenated usage. The survival of both has largely to do with the different emphases that the orthographic variance generates. The hyphenated word looks at the historical period after the colonial. The non-hyphenated usage includes this historical disjuncture as a starting point, but going beyond this is the belief, made implicit by the missing hyphen, that the disjuncture is not and cannot be definite. In this regard, one of the critiques of the hyphenated term, which the use of the “post” prefix itself underscores, is the assumption that the colonial is over. But this is arguably not the case. If the term “colonial” (which is not within the full purview of this entry) is treated in a non-historical or semi-historical sense—very much like the non-hyphenated term “postcolonial”—then the colonial can occur at the same time as the postcolonial, and the postcolonial can occur during the colonial period. The recognition, in applied linguistics, of the practical coexistence of the two concepts is found, for example, in the notions of “the colonial in the postcolonial” or “the postcolonial in the colonial” (Brutt-Griffler, 2002, pp. viii, 64, 73, 108, 161).

Edward Said

It is generally acknowledged that the first seminal text in what eventually became known as “postcolonial studies” is Edward Said’s 1978 book *Orientalism*. There were earlier post-colonial texts, such as Frantz Fanon’s *Black Skin, White Masks* (1952) and Albert Memmi’s *The Colonizer and the Colonized* (1957), but Said’s book provided the impetus for the field to establish itself. In spite of the general recognition of the book’s importance, the term “orientalism” and the nature and actual extent of Said’s impact on postcolonial studies are the subject of debate (for a critical survey, see Varisco, 2007).

One of the major problems of Said’s approach to orientalism is that the terms “orientalism” and “orientalist” have existed for a long time as neutral terms that are neither meant to

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0921

praise nor to blame the person or object associated with them. Whatever Said's strictures against orientalism are, orientalist research has certainly made major contributions to philology and comparative linguistics (McGetchin, Park, & SarDesai, 2004). Furthermore, modern linguistics as we know it today is indebted to orientalist scholars such as Sir William Jones, and to the orientalist discovery of Sanskrit as an Indo-European language (Newmeyer, 1988).

However, what Said has done is to cast aside orientalism's many positive achievements and to view the entire field in a largely negative light. This blanket assessment is both unfair and understandable. It is unfair because it leaves orientalism's achievements in the cold, and highlights its more unsavory aspects. It is understandable because the achievements had been well discussed before the publication of Said's book, and what he wanted to do was to achieve a sense of balance. He did not need to dwell further on the positive aspects of orientalist scholarship, as this had been comprehensively done by other scholars.

In portraying orientalism in a negative light, Said widens the meaning of the word by using it as a disparaging term that could be deployed whenever the East, the South, or the developing world in general are unjustifiably viewed. Thus one need not be an orientalist scholar to be disapprovingly described as an "orientalist," a term that generally acquired negative connotations after the publication of Said's book. What Said has brought about here is the broadening of the term from its more restricted original usage, or what is called "manifest orientalism," to its extended usage, or what is called "latent orientalism" (Kennedy, 2000). Latent orientalism goes way beyond traditional orientalist scholarship and can be found in numerous places. In applied linguistics, for example, the term "orientalism" has been used to describe research on English second language and foreign language teaching in Japan (Susser, 1998), even though the scholars described as, or rather accused of, being orientalist, are not orientalist in the original sense of the word.

One of the main ideas of Said's *Orientalism*—that scholarship on the East is done by colonial Westerners who present biased perspectives—is only partially corrected today. Scholarship is still dominated by the West. If, in the past, it was dominated by Westerners who were associated with one of the imperial powers, it is now associated with Western institutions of higher learning, which dominate postcolonial studies in the way that Westerners dominate orientalist research in the past (Dirlik, 1994). The main trends in postcolonial studies are still set by scholars in the major metropolitan centers of learning in the West, and views from the developing world have a tendency to feebly echo the views from these centers or, if they display some originality, they need to be filtered through postcolonial scholars from these institutions before they can gain a reasonable amount of circulation. In this regard, the only difference from more traditional orientalism is the significant number of postcolonial scholars who are not Westerners. However, as Dirlik (1994) has forthrightly reminded us, these scholars from non-Western countries become influential postcolonial intellectuals only when they arrive in, or are associated with, the main centers of learning in the first world.

Culture and Imperialism (1993) is another influential book by Said. The ideas in the book were not new when the book appeared, even within applied linguistics; Robert Phillipson's *Linguistic Imperialism*, for example—which has a similar thrust as Said's book, but concentrating on the cultural and political dominance of the English language and its teaching—appeared in 1992. Nevertheless, *Culture and Imperialism* is an important development for Said as a postcolonial thinker: It consolidated many of his major ideas in *Orientalism*, and explored some new paths. However, much of the biting criticism of the West found in *Orientalism* has been moderated here; Said is more of an establishment figure, approvingly analyzing some literary works with imperialist sympathies, such as Rudyard Kipling's *Kim*.

Homi Bhabha

Among major postcolonial theorists who have made an impact in applied linguistics, another figure should be mentioned here: Homi Bhabha. Unlike Said, Bhabha writes in an abstruse way, which often leads to ambiguous or vague conclusions that seem to favor rather than criticize the excesses of Western capitalism. In this light, he has been described as “a master of political mystification and theoretical obfuscation” (Dirlik, 1994, p. 333) and it has been similarly asserted that postcolonial scholars like him “mystify and obfuscate global inequalities and racism through incredibly dense and convoluted prose” (Krishna, 2008, p. 111). He has also been charged

with being elitist and obscurantist, engaging in word games, privileging the discursive over the economic, relying too heavily on Western psychoanalytical and poststructuralist theory, and—perhaps the most damaging criticism of all—being a privileged spokesperson for the Third World position. (Poddar, 2001, p. 64)

His influence on applied linguistics, which assumes that research must be presented clearly, is thus surprising.

Naturally, introducing the metaphors that Bhabha uses in his works or emulating his style of writing is fraught with risks. The following is an example from a book on language and culture (Hall, 2002, p. 19) that has clearly been influenced by Bhabha:

To locate culture one must look not in individual mind, as an accumulated body of unchanging knowledge, but in the dialogue, the embodied actions, discursively rearticulated (Bhabha, 1994, p. 177) between individuals in particular sociocultural contexts at particular moments in time. This perspective of culture as a dynamic, vital and emergent process located in the discursive spaces between individuals links it inextricably to language. That is to say, language is at the same time a repository of culture and a tool by which culture is created.

The above has been criticized by Steve Farrow as “a passage which reads like an eyewitness account of an explosion in a metaphor factory” (2004, p. 271).

Among Bhabha’s ideas that have been influential in applied linguistics is his notion of *hybridity*. But, like most of his ideas, the lack of clarity in definition and the unsystematic presentation of arguments often lead to the holding of apparently contradictory positions, and thus, again, pose risks for applied linguistics scholars who would like to adopt his views. The word “hybridity” as it is used by Bhabha aims to destroy the binarism in our thinking about culture. But one wonders if his playful attempt to erase the binarism of the colonized and colonialists, for example, is a useful exercise, as it allows him “to circumvent entirely the dense history of the material conflict between Europeans and natives and to focus on colonial discourse as if it existed in a vacuum” (JanMohamed, 1985, p. 60). In this regard, it has been pointed out that “Bhabha’s verbosity scarcely conceals the underpinnings of his position” where “his reading of the ‘colonial plot’ in *The Location of Culture* . . . is trapped by the cultural binarism that he wishes to critique” (Marrouchi, 2002, p. 145). In order to advance and conclude his slippery line of thought, Bhabha has to turn to and even strengthen the very divisions that he wishes to obliterate. As Patrick Colm Hogan (2004, p. 5) has correctly pointed out, “for Bhabha, there are precisely two alternatives—bad binarism and good hybridity. But that makes his own view a form of binarism.” Bhabha is certainly more conservative and pro-Western in his approach to postcoloniality when compared to Said in his *Orientalism*, which may explain the otherwise inexplicable popularity of his ideas—nebulous as they are—in Western academia.

If one were to apply Bhabha's notion of hybridity to language, there is nothing new or original in the two ideas that underlie it: that human languages have elements that can be found in, or are derived from, other languages, and that the idea of linguistic purity is not viable. These are long-held ideas whose history clearly precede Bakhtin's well-known discussion of hybridity in his *Problems of Dostoevsky's Poetics* (1984; first published in Russian in 1929). These ideas have been around in linguistic and philological research for well over a century and a half (see, for example, White, 1876, pp. 20, 149–50, 234, 279). However, although linguists may be critical of linguistic purism if it is looked at from a strictly linguistic perspective, they may be empathetic to it if it helps in the broader sociolinguistic understanding of the quest for identity by members of a language group, or their sense of social cohesion as reflected in their ability to preserve their language (Henningesen, 1989). When the existence of a language is under threat, the idea of linguistic purity may be promoted by defenders of the language, in the hope that the defining characteristics of the language, and hence the language itself, will survive (Unruh, 1994). Ultimately, unless reference is made to its historical usage in linguistics without the unnecessary homage to Bhabha, hybridity is a fashionable but overgeneralized and vague term, and a more specific term in applied linguistics, such as code mixing, interference, or borrowing, might very well do a better job in describing the linguistic situation in its appropriate contexts.

Other Approaches

This brief entry is not able to do justice to the various influential ideas in postcolonial studies and their usefulness or otherwise when used in applied linguistics. Among ideas that have some influence in applied linguistics and should be briefly mentioned is the distinction between the center and the periphery or between the central and the marginal, where the central is associated with the colonial or colonizer, while the marginal or peripheral is associated with the colonized and suppressed. However, this model may be too simplistic when applied to current linguistic situations, where what is central from one perspective, such as the notion of what Standard English should be, may be regarded as marginal from another perspective. What is needed here is what Alastair Pennycook (2000) has called "postcolonial performativity," which takes into account the contextual factors that give rise to notions such as centrality and marginality.

Post-Editing of Machine Translation

GEOFFREY S. KOBY

Post-editing of machine translation is an activity in which a translator compares a source text with a translation produced by an automated process (machine translation or MT) and edits it to make it acceptable for its intended purpose. Post-editing (PE) is a standard feature of any serious commercial MT system, and is similar to revision of human translation (HT). With the rise of computer-assisted translation (CAT) tools in the 1990s and 2000s, human translators now receive translation memories (TMs) from external sources containing translation units originating from humans or machines, and edit these translations using software. At the same time, automated translation is being integrated into CAT tools. Thus the line between post-editing MT and editing HT is becoming blurred.

Twentieth-century MT systems were developed using a set of grammatical rules and a lexicon, which created “raw” output considered incompletely finished text (see Allen 2003, p. 298). In the late 2000s, a new paradigm, “statistical machine translation,” became prominent; because the text produced is based on statistical analysis and machine learning from an immense corpus of human translations, its output, though still flawed, much more closely resembles HT and is thus more usable. Two major statistical MT engines are Google Translate and SDL Language Weaver; a mature version of Google Translate was released in late 2009 (Google Research Blog, 2006; Official Google Translate Blog, 2009). SDL Language Weaver is integrated into SDL Trados products and sold as a solution to industry (SDL, 2010). Guzmán notes, however, that “post-editing has become by now one of the most disliked tasks by translators. . . . translators still find it easier retranslating than post-editing MT” (2007).

When post-editing, translators and revisers are confronted with a very different type of text than HT, which is certain to contain errors that a human would not make. In 2010, the *New York Times* published an MT example (see Table 1), which shows the kinds of challenges faced by post-editors (*New York Times*, 2010):

Statistics-based Google Translate has rendered the vocabulary correctly, while Yahoo!’s older rule-based software has rendered some words incorrectly, due to dictionary limitations. No MT engine translates completely accurately and parts of the sentence need to be rearranged or edited. Although understandable, the sentence is not clear as to exactly what happened to whom.

Yet MT is used due to the increasing need for translation in a global economy, where the slow turnaround times and high cost of HT cannot keep pace. Recently, there has also been a vast expansion in computer software tools for translators, which blur the line between MT PE and CAT. As Garcia reports, “Integrating machine translation with translation memory is a very recent development in translation technologies. The prominent translation technology provider, SDL, allowed SDL Trados 2007 users direct access to its in-house MT in October 2008, and Multicorpora announced its Systran plug-in in January 2009. Wordfast and Swordfish provide inside access to Google Translate or any other Web based MT engine” (Garcia, 2010, p. 8).

Historically, the need for PE became apparent when researchers working on early MT systems observed that the output was quite defective. As early as 1980, Martin Kay noted: “Passages of innocent prose on which it was desired to effect this delicate and complex operation were subjected to a process of vivisection at the hands of an uncomprehending

2 POST-EDITING OF MACHINE TRANSLATION

Table 1 Comparing human and machine translations of Kafka's "The Metamorphosis" (*New York Times*, 2010)

Source	<i>The original text</i>	<i>Human translation</i>	<i>Google Translate</i>	<i>Yahoo! Babel Fish via Systran</i>	<i>Microsoft Bing Translator</i>
German "Die Verwandlung" ("The Metamorphosis") by Franz Kafka	Als Gregor Samsa eines Morgens aus unruhigen Träumen erwachte, fand er sich in seinem Bett zu einem ungeheuren Ungeziefer verwandelt.	One morning, as Gregor Samsa was waking up from anxious dreams, he discovered that in bed he had been changed into a monstrous verminous bug. —Kessinger Publishing, 2004	As Gregor Samsa awoke one morning from uneasy dreams he found is transformed in his bed into a monstrous vermin.	As Gregor Samsa of one morning from jerky dreams awakened, he was changed in its bed to tremendous vermin.	As Gregor Samsa of one morning from troubled dreams awakened, he was transformed in his bed to a tremendous vermin.

electronic monster that transformed them into stammering streams of verbal wreckage" (Kay, 1997, p. 5).

Significant cost savings have also been reported with PE. Bernhard states that the normal cost of post-editing MT output lies in the range of 20 to 30% of the cost of HT (Bernhard, 1994, p. 51, see also Vasconcellos & Bostad, 1992). A commercial Web site, Applied Language Solutions, promotes "a cheap translation service, post-editing of Machine Translation, which costs around 50% less than human translation" (Applied Language Solutions, *n.d.*).

Post-editors must be translators (see, e.g., Arnold, Balkan, Humphreys, Meijer, & Sadler, 1994, p. 12) because only a translator can judge translation accuracy, and only with access to the source text (Kay, Gawron, & Norvig, 1994, p. 43). McElhaney & Vasconcellos state "The translator is the one best able to pick up errors in the machine translation (e.g., misparsed or unparsable ambiguities), he has a fund of knowledge about the cross-language transfer of concepts, and he has technical resources at his disposal which he knows how to use in the event of doubts" (1988, pp. 142–3). Whatever the defects found in the raw output, the translator will be expected to find and remedy them, while spending (significantly) less time than HT would take. Vasconcellos and Bostad agree: "For the product that has a public and undergoes scrutiny, a translator post-editor must be enlisted to eliminate all problems from the output, interpret connotations appropriately and make certain that the reader will understand precisely what the author intended to say" (1992, p. 58). However, Lange notes that a post-editor with a very negative attitude caused total MT plus PE time to exceed that of HT, stating, "It is even possible to roughly predict the amount of time a translator needs for post-editing a text from their attitude towards machine translation" (Lange, 1998, p. 36).

In recent years, controlled language (CL, that is, source texts created using restricted rules for vocabulary, syntax, etc.) has been used to improve MT quality. O'Brien points out that "A subdomain within CL research is the assessment of a text's 'machine translatability' by assigning numeric penalties to linguistic features that are known to be

problematic for MT—termed ‘negative translatability indicators’ (NTIs)—and by then calculating the ‘machine translatability index’ of that text” (O’Brien, 2007, p. 84). Her work showed “that segments with minimal occurrence of NTIs can be processed faster by post-editors than those containing NTIs. This finding provides empirical evidence to support the assertion that controlling the input to MT leads to faster post-editing” (O’Brien, 2007, p. 115).

User needs ultimately determine the quality level to which raw MT output should be edited. The final purpose of the translation—somewhere between “information only” and “publication”—determines the level of final quality (McElhaney & Vasconcellos, 1988, p. 145). Vasconcellos points out that “Extensive changes make the process too costly and negate the advantage of MT” (1987b, p. 414). Meanwhile, some end users may accept inferior output that can be had cheaply or quickly—or for free. If MT is free, as on the Internet for general text and Web pages, casual users may be happy with the output, even though no PE is available. Nonlinguist users of post-edited MT sometimes cannot tell the difference between MT and HT. For professional linguists, on the other hand, as noted above (Garcia, 2010), computer-assisted translation tools are capable of incorporating automated translations into the regular working environment of any translator. Grunwald (2010) describes a method for including automated translations in TMs that are sent to freelance translators and advises project managers to “Insist that they thoroughly review each TU and rewrite it if necessary.” These translations are then returned to the central TM and enter into future MT output, which is then improved. Thus the working life of translators can be expected to include PE as a matter of course.

To avoid excessive cost, it is necessary to preserve MT output and edit only those points in the text that are necessary to make the sentence function properly. However, Vasconcellos and Bostad acknowledge that a balance must be struck between such minimal editing and quality standards (1992, pp. 68–9). The primary linguistic skill needed is revision skill—the ability to decide what to change and how much to change. One part of this skill involves information flow. Vasconcellos argues that the flow from given to new information (or from theme to rheme) in any one sentence is actually a crosslinguistic phenomenon that should be maintained by changing the word class of a given item, say from noun to verb, instead of reordering the sentence (1987a, p. 140). This is an approach that has significant implications for saving keystrokes in on-screen PE, and can work very well for language pairs such as Spanish and English, where word order is either similar or can be modified in predictable ways. The principle is not entirely universal, however, and is likely to be overshadowed by other linguistic considerations when the two languages are more linguistically distant.

Somers points out, “As obvious as it may seem, efficiency in cursor positioning, use of search-and-replace and, in particular, developing an ability to see the best combination of word-processor ‘moves’ to bring about a change, are all as important as linguistic skills in the relevant languages. . . . A typical and intuitive way to revise a translation is to start at line 1 and work through the text. But to do so is to ignore many of the capabilities of the typical word-processor, some of which will be particularly useful when post-editing machine translation output. It is better to take a more structured approach to post-editing, in particular with respect to recurring errors, which can be fixed by using global search-and-replace (S&R)” (Somers, 1997, p. 202). In the Pan American Health Organization, post-editors in the 1980s were able to create macro functions to speed up their work by automating repetitive correction tasks (Santangelo, 1988, p. 134). This implies that translators would have to have a reasonably extensive knowledge of the capabilities of their word processor or CAT tool in order to write these macros.

It is also necessary to make the working conditions as helpful as possible for the translator. Newton summarizes the efforts in this regard: “Most MT systems have a synchronized

split-screen editing mode which enables the post-editor to view and scroll the raw translation in tandem with the corresponding section of source text. Quality control rests with the post-editor and must be assumed to be as rigorous as that applied to human translation produced for similar purposes" (1992, p. 8). This parallel scroll function is also a feature of modern CAT tools. Povlsen and Bech describe an intelligent post-editing facility called Ape: "an innovative approach to easing the burden of post-editing, going beyond providing an environment with pre-implemented short-cut key operations for the repetitive types of corrections to be made by the post-editor. The basic idea of the Ape strategy is to exploit the linguistic information present in the text to 'repair' different kinds of flaws which are tedious to deal with manually in post-editing" (Povlsen & Bech, 2001, p. 4).

The quality of the MT output is the most important factor in the speed of PE output. PE speed also varies widely depending on the editor's familiarity with the subject matter, word-processing skills, experience with PE and the specific PE system. Vasconcellos states that "Some of the SPANAM and ENGSPAN post-editors have produced as many as 10,000 words of polished, camera-ready copy in eight hours" (1987a, p. 145). This implies that this is not the average rate, as is confirmed by Vasconcellos and León: "Specially trained translators, working at the word-processing screen, produce polished output of standard professional quality at a rate between two and three times as fast as traditional translation (4,000–10,000 words a day for PE . . .)" (1988, p. 187). At the very least, in order to be cost-effective, MT throughput cannot be less than HT production. Vasconcellos and León confirm this (1988, p. 223; see also Vasconcellos & Bostad, 1992, p. 67). In 2007, O'Brien conducted an experiment that showed "when taken as a first-pass exercise with no revision or proof-reading and with the specified goal of producing publishable quality output, post-editing is, on average, faster than human translation" (O'Brien, 2007, p. 115). Although no more recent studies exist, it seems likely that the improved quality of recent statistical MT will make post-editing of such output even faster.

Poststructuralism

BONNY NORTON AND BRIAN MORGAN

Our interest in poststructuralism in applied linguistics arises from our work as language teachers and researchers, and our mutual desire to promote a productive relationship between social theory and classroom practice. In support, we find three characteristics of poststructural theory of particular relevance for our work. First, poststructuralism constitutes a set of theoretical stances that serve to critique prevailing assumptions regarding the sources and nature of identity, and the rational, humanist subject of the Enlightenment (see Weedon, 1997; Norton, 2000; Kramsch, 2009; Morgan & Clarke, 2011). Second, poststructuralism critiques the conditions and foundations of knowledge, particularly with reference to its apparent objectivity and universal applicability (see Foucault, 1980). Third, poststructuralism critiques the representational capacities of language and texts, foregrounding their intertextuality, multivocality, and at times, indeterminacy (see Derrida, 1978; Sarup, 1993). Characteristic of the “linguistic turn” in contemporary thought, poststructuralist theories assign conceptual and analytic prominence to language—and indeed all forms of meaning making (cf. multimodality; Kress, 2009). In poststructuralist theory, language is seen as central to the circulation of discourses—systems of *power/knowledge* that define and regulate our social institutions, disciplines, and practices. In poststructural terms, discourses normalize the personal and collective possibilities we are capable of imagining in place and time. No longer neutral in this discursive framework, language becomes a key site for the ongoing creation and contestation of identity and its *performativity* (see Butler, 1990), even at the level of the unconscious, where the acquisition of language, following Lacan (1977), serves as a social template that structures and displaces the psychic unity of a prelinguistic self.

To explore the relevance of poststructuralism for applied linguistics, and given our interest in the relationship between social theory and language teaching, we revisit two critical incidents in classroom settings, reported in the literature, which serve to highlight how meaning is constructed across time and space, how identities are implicated in meaning making, and how knowledge and power are inextricably linked.

Two Critical Incidents

The first critical incident, reported in the *TESOL Quarterly* (Norton Peirce, 1990, p. 105), describes a discussion in Norton’s language classroom following what has been called “the Montreal massacre” in Canada. Norton describes the incident as follows:

In the wake of the December 1989 killing of 14 female engineering students by a young male in Montreal, Canada, my students were struggling to make sense of the shocking event. It soon became apparent that the ways in which different students attempted to interpret, and more importantly *name* the event, created conflict in the class. Some students understood the event as an act of hatred against women, and named it an anti-feminist massacre; others understood the event as symptomatic of generic militance in our society, and named it an act of violence; still others understood the event as the isolated act of an insane individual, and named it an act of madness . . . Why was the act of naming such an important one for my students?

2 POSTSTRUCTURALISM

The second critical incident, drawn from Norton (2000, p. 143), describes the experience of a young adult immigrant language learner called Mai in Toronto, Canada, who grew increasingly dissatisfied with her English-language class, and eventually withdrew from the course:

I was hoping that the course would help me the same as we learnt [in the 6-month English as a second language course], but some night we only spend time on one man. He came from Europe. He talked about his country: what's happening and what was happening. And all the time we didn't learn at all. And tomorrow the other Indian man speak something for there. Maybe all week I didn't write any more on my book.

While each of these critical incidents took place at different times and in different places, what they have in common are struggles over meaning, identity, and power, themes of central interest to poststructuralism. In order to better understand and address the challenges represented in each of these classroom contexts, we will examine poststructuralist theories of language, identity, and investment, respectively, and then turn to their relevance for classroom teaching.

Poststructuralist Theories of Language, Identity, and Investment

Poststructuralist theories of language, which achieved prominence in the late 20th century, have been influenced by such scholars as Bakhtin (1981), Bourdieu (1977), Derrida (1978), Weedon (1997), and Foucault (1980). These theories build on, but are distinct from, structuralist theories of language, associated predominantly with the work of Saussure. Saussure's (1966) distinction between speech (*parole*) and language (*langue*) was an attempt to provide a way of recognizing that, despite geographical, interpersonal, and social variations, languages have shared patterns and structure. For structuralists, the building blocks of language structure are signs that comprise the signifier (or sound image) and the signified (the concept or meaning). Saussure notes that it is the interrelationship *between* signs within a specific linguistic system that guarantees their meaning, and that each linguistic community has its own set of signifying practices that give value to the signs in a language.

Poststructuralists both build on and critique Saussure's linguistic insights. One of the criticisms leveled at his notion of language is that structuralism cannot account for *struggles* over the social meanings that can be attributed to signs within a given language. The signs /research/, /SLA/, and /identity/, for example, can have different meanings for different people within the same linguistic community. Witness, for example, debates over the meaning of "SLA theory" in the field of applied linguistics (Zuengler & Miller, 2006; Block, 2007a; Swain & Deters, 2007). Thus while structuralists conceive of signs as having arbitrary meanings and linguistic communities as being relatively homogeneous and consensual, poststructuralists take the position that the signifying practices of societies are sites of struggle, and that linguistic communities are heterogeneous arenas characterized by conflicting claims to truth and power.

With reference to poststructuralist theories of identity, Weedon (1997) is centrally concerned with the conditions under which people speak, within both institutional and community contexts. Like other poststructuralist theorists who inform her work, Weedon foregrounds the role of language in her analysis of the relationship between the individual and the social, arguing that language not only defines institutional practices, but serves to construct our identity, or what Weedon calls our subjectivity. Weedon notes that a person's subjectivity, which is defined as diverse, contradictory, and dynamic, signifies a different conception of the individual than that associated with humanist philosophy, which presupposes that every person has an essential, fixed, and coherent core. Poststructuralist

approaches to theorizing identity have also been influential in the work of cultural theorist Hall (1997) and postcolonial theorist Bhabha (2004), who de-essentialize and deconstruct identity categories such as race and gender. Poststructuralist theories of identity have struck a chord in applied linguistics, with a range of monographs making a significant impact on the field (e.g., Norton, 2000; Toohey, 2000; Block, 2007b; Heller, 2007; Blommaert, 2008; Kramsch, 2009).

Extending poststructuralist theories of identity, Norton (Norton Peirce, 1995; Norton, 2000) has developed the construct of “investment,” in contrast to “motivation,” to better understand the relationship between language-learner identity and language-learning commitment. Inspired by the work of Bourdieu (1977, 1991), Norton argues that if learners “invest” in the target language, they do so with the understanding that they will acquire a wider range of symbolic and material resources, which will in turn increase the value of their cultural capital and social power. Unlike the construct of motivation, which often conceives of the language learner as having a unified, fixed, and ahistorical “personality,” the construct of investment conceives of the language learner as having a complex identity, changing across time and space, and reproduced in social interaction. Further, while motivation can be seen as a primarily psychological construct (Dornyei, 2001), investment must be seen within a sociological, poststructuralist framework, and seeks to make a meaningful connection between a learner’s desire and commitment to learn a language, and the learner’s changing identity.

Poststructuralist Theory and Classroom Practice

To what extent can poststructuralist theories of language, identity, and investment help us to make sense of the two critical incidents described above? With regard to the first critical incident, we need to address why the *naming* of the Montreal massacre created conflict in the class. A structuralist conception of language would enable students to understand the subtle difference between the naming of a “massacre” as opposed to the naming of a “murder” or “genocide.” Significantly, however, it would not account for the *conflicting struggle* over the meaning that could be attributed to the sign /massacre/ with reference to the particular space/time location of the Montreal killings. It was a struggle by different groups to situate the event within a discursive framework that would legitimate some views and invalidate others. The contrasting meanings of the massacre arose partly as a result of the different investments the students had in the event. Students with investments in discourses of gender would seek to legitimate the view that the massacre was an antifeminist act; students with investments in discourses of social violence would legitimate the view that the massacre was an act of militancy; and students with investments in mental health would legitimate the view that the massacre was an act of insanity. Each discursive framework would evoke and authorize different ways of knowing and, crucially, responding to the event. In other words, the meaning of the massacre was not only a product of a linguistic system that differentiates signs in relation to one another, albeit in a social context, but was located in the intersection between the event, the sign, and the students’ investments in the event and the sign. By extension, the students’ contrasting investments are best understood with reference to their complex identities as constructed within particular discourses, with conflicting claims to truth and power.

With reference to the second critical incident, how can poststructuralist theories help us understand why Mai felt she was learning little in the class, appeared unmotivated, and ultimately dropped out of the class? The construct of investment, as opposed to the construct of motivation, provides for a different set of questions associated with a learner’s commitment to language learning. In addition to asking, “To what extent was Mai motivated to learn English?” we would ask, “What was Mai’s investment in the language

practices of her English classroom?" Although we knew that Mai was a highly motivated language learner, it was clear that she had little *investment* in the language practices of her classroom. This lack of investment arose from resistance to the pedagogical practices of the teacher, whose lesson plans appeared to reproduce identity along homogeneous ethnic lines (European, Indian, etc.). While it could be argued that the teacher was attempting to validate the ethnic identities of the students by inviting them to make public presentations about their native countries, the teacher paid little attention to other identity categories (e.g., gender, class, sexual orientation) across different sites (e.g., home, workplace, school). In other words, the teacher had an essentialized conception of the individual as unified, stable, and unchanging, rather than a poststructuralist conception of identity as multiple, changing, and a site of struggle. Further, the teacher appeared to focus primarily on the students' histories, rather than addressing the pressing demands of the present and the future. An emerging body of research on language learning, imagined identities, and imagined communities (e.g., Kanno & Norton, 2003; Pavlenko & Norton, 2007) suggests that learners' hopes and desires for the future have a significant impact on their investment in language practices in classrooms and communities.

Points of Contention and Sites of Innovation

Poststructuralist theory continues to inspire both critique and innovation within applied linguistics. One key challenge remains a coherent definition for a notion of *agency* (Ahearn, 2001; Menard-Warwick, 2006). How should we understand and encourage the capacity to question dominant meanings and resist essentialized identities—as demonstrated in the incidents above? To what extent is *agency* a quality that pre-exists discourse? To what extent do we reject this humanistic assumption, and claim that we are determined, "spoken," by the language we use and by the subject positions we occupy? Drawing on Bakhtin, Vitanova (2005) suggests a promising middle ground located in dialogue and based on the subtle ways in which the sociohistorical "voices" we appropriate include and become our own. In the move from theory to practice, however, the expectations of agency can be exaggerated, placing unrealistic pressures on language teachers and applied linguists, many of whom are relatively powerless to transform their sites of practice or the social conditions of those with whom they work (e.g., Morgan, 2009).

Another key tension can be illustrated by referring again to the struggle over naming the Montreal killings and the specific discourses (e.g., gender relations, social violence, or mental health) and interventions they incite. In short, on what basis do we ultimately determine the "truth" of what happened and the best way to proceed? Arguably, when truth, reality, and meaning become pluralized and destabilized—as the work of Derrida and Foucault would indicate—we can become politically paralyzed. We become "prisoners of discourse," as Sarup (1993, p. 97) suggests, both afraid to act and interpretively desensitized to the physical realities of poverty and violence, a critique also made by Luke (2009) in respect of discourses on race and racialization. Ramanathan's (2009) study of language and bodies raises similar concerns. Though she uses poststructuralism to illuminate the shame and powerlessness that people with disabilities experience as subjects of medical discourses, she also sees the need to "*bring the body back* in humanizing terms" (p. 64, *italics in original*).

Still, some find the poststructural destabilization of knowledge and meaning liberating—a principled politics whose aim is not to supplant one orthodoxy with another but to provide conceptual tools that expose the partiality of all truth claims, thus weakening their commonsense power over subjects-in-discourse. Many innovative examples can be cited. The project of language disinvention (Makoni & Pennycook, 2007) examines the historical

and contemporary collusion of linguistic systems of description with colonial and nationalist ideologies. Such counter-discourses support locally responsive policies and pedagogies (Canagarajah, 2005; Ramanathan & Morgan, 2007). As Crookes (2009) notes, “aware[ness] of the existence of a range of ‘theories of truth’” (p. 123) encourages teachers to become researchers and curricular decision makers. Such awareness, as well, has shifted the profession from preoccupations with “best” methods and their efficient delivery to questions of ethics and values based on postpositivistic epistemologies (e.g., Johnston, 2003; Reagan, 2004; Clarke, 2009; Crookes, 2009). Butler’s theory of performativity re-situates identity’s salience within acts and processes of meaning, becoming, and identification—a conceptual approach that has inspired Pennycook’s (2007) research on global Englishes through rap and hip-hop, Nelson’s (2009) innovative work on queer theory and pedagogies in English-language teaching, and Morgan’s (2004) study of teacher identity as pedagogy. Certainly, one of the more enduring meanings to be destabilized via poststructuralism—and through the construct of “investment”—is that there is an identity, a definable, universal essence shared by all humanity.

Practice in Second Language Instruction

ROBERT DEKEYSER AND RAQUEL CRIADO

The Meaning of Practice

The belief that practice is needed in order to achieve mastery in different skills (driving a car, playing the piano, sewing, cooking, etc.) is shared by laypeople and specialists alike. Language learning is not an exception to such a belief. Practice has been at the basis of language learning throughout history. The nature of practice varies depending on the setting and circumstances in which language is learned and taught, however. While practice in informal contexts implies exposure to and usage of (in this order) the language as it is naturally used by native speakers, the educational environment guides and controls what is to be learned and taught and how the learner should internalize this knowledge. Accordingly, many different varieties of practice exist in language pedagogy.

The basic key feature traditionally underlying the concept of practice is *repetition*. Even a loose understanding of practice as language use or contact with the language being learned implies some sort of repetition of linguistic items. DeKeyser (2007a) defines practice as follows: "Specific activities in the second language, engaged in systematically, deliberately, with the goal of developing knowledge of and skills in the second language" (p. 1). This definition also implies repetition; however, it allows for more variety, since practice is embedded in a variety of activities.

Practice remains a controversial topic in second language instruction. For example, Ellis (1993, p. 109) considers that (production) practice is important for pronunciation and formulaic knowledge, while he challenges the value of traditional practice in grammar; VanPatten (2003) favors input practice at the expense of output practice; DeKeyser (2007b) claims the need for both input and output practice to develop grammar proficiency in reception and production modes respectively.

The Praxis of Practice

Practice in second language instruction has been often identified with drills (DeKeyser, 2007a). In particular, drills were the hallmark of the audio-lingual method (ALM) in the mid 20th century as a pedagogical technique for the mastery of structures, which was accomplished through constant repetition as the response to a stimulus in the shape of a cue. Most of the times such repetition was *mechanical*: it did not involve any form-meaning connections as there was only a correct answer which could be inferred through mere analogy. As DeKeyser (2007a, p. 11) states, "mechanical drills can only serve a very limited purpose, because they do not make the learner engage in what is the essence of language processing, i.e., establishing form-meaning connections." This accounts for the negative connotation attached to drills nowadays.

Drills have sometimes been equated with mechanical drills. However, Paulston (1972) distinguished three different types of drills: mechanical, meaningful, and communicative drills. In mechanical drills, exclusive attention to form is achieved by means of the students'

repeating or manipulating the cue supplied by the teacher, for example, using the pronoun “she” (the cue) in the correct way after the given model sentence, “*I have a book.*” Meaningful drills allow deviation towards some sort of attention to meaning. The speakers communicate, but the content of this interaction is already known to them. Communicative drills permit exchanges in which the transmission of content is the primary goal while emphasizing form as well. Therefore, in so far as *drilling is meaningful*, it can be considered useful “repetitive practice.”

Since the 1970s, communicative language teaching (CLT) has brought new ways of practicing to the classroom. Repetition per se may be efficient and necessary in the learning process, but it may also be boring and demotivating. Emphasis on the communicative process has brought the richness and variety of actions that speakers engage in while communicating into the classroom. Real communicative events offer a wide range of possibilities for promoting language use in different contexts, aiming at different communicative functions; this requires the application of a variety of strategies. Authentic communicative events may, therefore, be pedagogically adapted to become models in the design of activities for instructed second language acquisition (Criado, 2010). This is the source of inspiration for techniques through which practice is implemented in most contemporary textbooks. Blank filling, matching, information and opinion gaps, controlled role plays, summarizing or finishing aural or written texts, jigsaw reading and listening, discussions, debates, extended role plays and simulations, problem-solving, essays, and so forth, contribute to enrich practice by enlarging its scope and helping to avoid the negative effects of mechanical repetitive strategies. Such variety of activity types allows a richer and more comprehensive approach to the praxis of practice.

Research on Practice

Early research on practice in language learning tended to be very much embedded in broader research on the relative value of different language teaching “methods.” By comparison, contemporary research tends to focus on much more specific aspects of practice, including: the effect of comprehension (reading and listening) versus production (speaking and writing) activities on the development of these different skills (e.g., DeKeyser, Salaberry, Robinson, & Harrington, 2002; VanPatten, 2002); the effect of different kinds of corrective feedback such as prompts, recasts, explicit correction (e.g., Leeman, 2007); and the differential effect of various activities and their sequencing on the three outcomes of accuracy versus fluency versus complexity of expression (e.g., Housen & Kuiken, 2009).

Besides ongoing research in the area of language teaching and learning itself, research in cognitive and educational psychology is also relevant to the issue of practice in language learning. Decades of work in skill acquisition theory in psychology have led researchers such as DeKeyser (1997) and Robinson (1997) to empirical work on language learning, showing, respectively, that Anderson’s ACT three-stage model of skill acquisition (e.g., Anderson et al., 2004) is applicable to learning the grammar of a second language under controlled conditions, and that Logan’s item retrieval model (e.g., Logan, 2002) does not seem to be. Serrano (2011) put to the test the widely accepted belief that distributed practice is better than massed practice, and found that this may not apply to the distribution of a second language curriculum over years versus months.

Choices in Practice and Pending Questions

In spite of the progress made over the last half century, learners and teachers still face a bewildering array of questions about practice to which there is no clear answer. Most

applied linguists would agree by now that form-meaning connections should be the core content of practice; that both input (comprehension) and output (production) are important; that a certain amount of systematic, deliberate practice is useful; that corrective feedback has its place; and that, within a limited range, different emphases can be put on accuracy, fluency, and complexity. Other issues remain more controversial from a theoretical point of view, problematic from a practical point of view, or both.

On the input side, questions remain about the ideal balance of authenticity versus systematicity (pedagogical arrangement) of input and on the best strategies for teaching learners listening and reading skills. On the output side, questions remain about the need for systematic practice of form versus practicing forms as they come up in real-life tasks. When it comes to communicative interaction, some of the biggest questions surround the issue of corrective feedback: How much should be given, when, by whom, and how?

On top of the complexity of these questions by themselves, both from a psycholinguistic and from a pedagogical perspective, there is the issue of age and individual differences. Few would doubt that the need for (explicit) form-focused practice is bigger for adults than for children, that the desirability of explicitness in teaching, practice, and feedback depends not only on the complexity of the structure but also on the aptitude of the learner, and that the nature of students' motivation needs to be taken into account if the choice of practice activities is to be a help rather than a hindrance.

In spite of the various debates surrounding the nature of practice and its different facets, contemporary authors from different teaching perspectives agree that good praxis implies that activities should make students process form-meaning relationships and involve real-life operating conditions (DeKeyser, 2007b). Communicative practice is a must, but focus on form and deliberate practice have their place among "best practices" too.

Pragmatic Awareness in Second Language Learning

SATOMI TAKAHASHI

Pragmatic awareness is the recognition or knowledge of the way in which language is used to encode social meaning through conscious reflection of relationships among factors involved in pragmatic comprehension and production. There are two types of pragmatic awareness: pragmalinguistic awareness and sociopragmatic awareness. Pragmalinguistic awareness is explicit knowledge of the form–function relationships relevant for particular sociocultural contexts. For instance, if a person knows that the interrogative form used when addressing his or her interlocutor’s ability functions as a request (e.g., “Can you open the window?”), he/she manifests pragmalinguistic awareness of the formulation of one type of request. Sociopragmatic awareness is explicit knowledge of relationships between communicative action and contextual factors such as social status, social distance, and imposition arising from the communicative action. For instance, if a person knows that a given culture favors a more indirect way of correcting arguments made by a higher-status person than by a status-equal or status-low person, this reflects their sociopragmatic awareness. In short, sociopragmatic awareness is recognition of what constitutes appropriate linguistic behavior in a particular speech community. The two types of pragmatic awareness have been independently and jointly investigated, providing us with significant insights into the role of pragmatic awareness in second language (L2) learning.

From a theoretical perspective, pragmatic awareness is a construct essential for explicating every aspect of the learning of pragmatic features, and Schmidt’s (1995, 2001) noticing hypothesis supports this view. The noticing hypothesis claims that learners have to *notice* L2 features in the input for the subsequent development to occur in the L2. The term “notice” is broadly defined here as detection with *conscious awareness*, and it is contended that learning requires conscious awareness at the time of the learning of the target features. The noticing hypothesis further postulates two levels of awareness—awareness at the level of noticing (i.e., identification of the targets without mentioning any rules) and that at the level of understanding (i.e., recognition of the targets with the explicit formulation of rules). The majority of the studies on pragmatic awareness in L2 learning has been undertaken to examine the validity of the noticing hypothesis within the framework of either of the two levels of awareness.

More specifically, past research on L2 pragmatic awareness can be categorized into two strands. One focuses on learners’ sensitivity to or judgment on pragmatic appropriateness (Bardovi-Harlig & Dörnyei, 1998; Schauer, 2006); the studies in this category fundamentally explore awareness at the level of *noticing*. The other research strand emerged in response to Kasper and Schmidt’s (1996) call for further investigation of the developmental aspects of L2 pragmatics. It compels us to investigate the role of pragmatic awareness in developing learners’ pragmatic competence and the ways of raising their pragmatic awareness in order to advance their pragmatic competence in L2. The studies in this category essentially address the issue of awareness at the level of *understanding*. This research tradition has primarily been implemented in the framework of instructional effects (Billmyer, 1990; Alcón-Soler, 2007).

This paper will attempt to provide a brief overview of the empirical findings of past research on pragmatic awareness by following the above-mentioned research strands. Emphasis will be placed on explicating the conditions under which pramalinguistic and sociopragmatic awareness can be raised significantly, thereby contributing to L2 pragmatic development.

Pragmatic Awareness as Sensitivity to Appropriateness

A seminal paper in the first research strand is Bardovi-Harlig and Dörnyei (1998), which directly addressed the issue of awareness at the level of *noticing* by investigating learners' perception of error gravity. Bardovi-Harlig and Dörnyei compared learners' judgments of pragmatic deviation with those of grammatical errors and examined the effect of learning context on their deviation perception. The participants included EFL (English as a foreign language) learners in Hungary, ESL (English as a second language) learners residing in the United States, and English teachers in Hungary and the United States. The participants performed a video elicitation task for speech acts of request, apology, suggestion, and refusal. The video task consisted of 20 scenarios, and the final sentence of a short dialogue in each scenario was used as a test item. These items were categorized into the following three types of sentences: (a) sentences that were pragmatically appropriate but ungrammatical; (b) sentences that were grammatical but pragmatically inappropriate; and (c) sentences that were both grammatical and pragmatically appropriate. The participants were asked to evaluate the appropriateness or correctness of the target items; if their evaluation was negative, they were instructed to rate the severity of the deviation on a six-part scale. The results indicated that EFL learners and their teachers consistently identified and ranked grammatical errors as more serious than pragmatic infelicities. However, ESL learners and their teachers exhibited exactly the opposite tendency. Bardovi-Harlig and Dörnyei then argued for the significant effect of learning context on learners' awareness at the level of noticing.

Niezgoda and Röver (2001) and Schauer (2006) replicated the study of Bardovi-Harlig and Dörnyei (1998) by employing their video task. Niezgoda and Röver examined grammatical and pragmatic awareness for EFL learners in the Czech Republic versus ESL learners in Hawaii, while Schauer compared EFL learners in Germany with ESL learners in England. Contrary to the original findings, Niezgoda and Röver found that their EFL learners were more aware of pragmatic infelicities than their ESL counterparts. They attributed this discrepancy to the fact that their ESL learners were "average" learners, whereas their EFL learners comprised a highly select sample with higher proficiency in L2, who intended to teach English. Thus, it appears that proficiency and possibly learning motivation might override the effect of learning context. On the other hand, Schauer's data revealed results similar to those of Bardovi-Harlig and Dörnyei; her German EFL learners were less aware of pragmatic infelicities than the ESL group. Further, Schauer found that the ESL learners increased their pragmatic sensitivity substantially during their stay in England, validating the strong effect of learning context on awareness at the level of noticing.

Pragmatic Awareness Raising Through Instruction

Studies on pragmatic awareness raising through instruction essentially explore the nature of awareness at the level of *understanding*. The need for pragmatic instruction was triggered by the claim that learners may not be able to develop their L2 pragmatic competence sufficiently without relying on some forms of instruction (intervention) or awareness raising on "rules" for comprehending and producing target pragmatic features. In other words,

simple exposure to the target language (TL) input may not contribute to rapid and adequate development of learners' pragmatic abilities. This is notably verified in a series of studies conducted by Lawrence Bouton with regard to ESL learners' development of their implicature abilities, namely, abilities to identify the contextually implied meaning of utterances. For instance, the response utterance "Does the sun come up in the east?" is interpreted as "Yes." Bouton (1999) compared the following groups of ESL learners: (a) an immersion group that consisted of learners who had been on an American university campus for 17 months, 33 months, and 4–7 years without receiving any type of instruction on implicature; and (b) an intervention group that comprised ESL learners who had just started their college lives in the United States and received instruction on different types of implicature. The results revealed that the intervention group was able to acquire implicature abilities to the same extent as the immersion group, which still exhibited inadequacy in its implicature abilities. This suggests that the acquisition of pragmatic competence progresses slowly and incompletely when learners are simply exposed to TL input. However, learners who have newly arrived in the TL community are able to achieve the same level of pragmatic competence as those in the immersion group as a result of receiving some forms of awareness-raising intervention.

In view of the effectiveness of pragmatic instruction in the second language (SL) context as evidenced in Bouton (1999), classroom instruction incorporating various pragmatic awareness-raising tasks is desperately needed in foreign language (FL) contexts, where learners have limited opportunities to expose themselves to TL input and to utilize newly learnt L2 pragmatic strategies outside the classroom. In light of this necessity, an increasing number of studies on instruction that raise pragmatic awareness have been conducted in FL contexts (Alcón-Soler & Martínez-Flor, 2008).

Takahashi (2010) reviewed 49 pragmatic intervention studies with the pretest–posttest design and identified three major points. First, metapragmatic information provided through explicit intervention (as opposed to implicit intervention that does not provide such information) plays a significant role in enhancing learners' pragmatic awareness (Billmyer, 1990; Alcón-Soler, 2007). In particular, maximum increase in sociopragmatic awareness can be achieved under explicit intervention (Liddicoat & Crozet, 2001; Rose & Ng Kwai-fun, 2001). Second, explicit intervention does not always yield significant learning outcomes. Learners receiving such intervention simultaneously show a lower degree of confidence in implementing pragmatic strategies (Takahashi, 2001). Moreover, mixed results were obtained within and across the studies on explicit intervention (Tateyama, 2001). Third, some forms of implicit intervention effectively raised pragmatic awareness (Martínez-Flor, 2006; Takimoto, 2007).

On the basis of the above overview, Takahashi (2010) concluded that awareness at the level of understanding is a must but should be considered as the *minimal* condition for substantial pragmatic development, emphasizing the necessity of heightening the level of this awareness to the extent that learners can successfully and satisfactorily engage in communication in the L2 with greater confidence. According to Takahashi, such a substantially higher degree of awareness at the level of understanding is attained only when interventions—irrespective of their explicitness—ensure parts or all of the following four conditions: (a) learners' analysis of their own pragmatic deficiencies; (b) learners' active engagement in the cognitive comparison of their own performance with the normative performance that appears in natural interactions; (c) learners' own discovery of the target pragmatic conventions; and (d) learners' experiences of immediate communicative needs in relation to the intervention tasks. Three studies that satisfy one or more of these four conditions are discussed below.

Billmyer (1990) meets almost all of the four conditions. In the framework of explicit intervention, Billmyer explored the effect of instruction on compliments and compliment responses in the ESL context using Japanese learners of English as her participants. Before

receiving metapragmatic information on the target speech acts, the learners analyzed various natural data, including those they had collected themselves outside the classroom, and identified the social rules for the target speech acts on their own. In the pretest and posttest activities, the learners engaged in compliment-inducing tasks that required them to audiotape their conversations with the native speakers (NSs). It is noteworthy that the posttest actually consisted of seven post-instructional tasks for an extended period, and these activities provided the learners with ample opportunities to perform the target speech acts in relatively natural communication settings based on their own communicative needs as well as to compare their own performance with the NS performance. Billmyer's research design, therefore, was successful in substantially raising learners' awareness at the level of understanding; in fact, the study led to significant learning outcomes.

Unlike Billmyer (1990), Alcón-Soler's (2007) research was undertaken in the EFL context and within the framework of "explicit intervention versus implicit intervention." Alcón-Soler investigated the instructional effects on Spanish EFL learners' learning of English requests by employing the excerpts of a television series as instructional materials. The delayed posttest indicated that the learners in the explicit group were more likely to maintain high pragmatic awareness, and this may be attributable to the learners' own discovery of the target pragmatic conventions, that is, their finding request examples in the scripted version of the excerpts on their own, and justification of their choice. On the other hand, the implicit group performed awareness-raising tasks that involved typographical enhancement (requests and related sociopragmatic factors were in bold type or capitalized). The participants were simply required to find the requests designated by the researcher. This clearly indicates that other-initiated enhancement is ineffective in substantially heightening learners' awareness at the level of understanding as compared to self-initiated activities as experienced by the learners under explicit intervention.

Takimoto (2007) also compared the effectiveness of explicit and implicit interventions in teaching Japanese EFL learners how to make requests in L2. Takimoto examined the effects of the following three types of input-based interventions: (a) structured input tasks with metapragmatic information (explicit intervention); (b) problem-solving tasks (implicit intervention); and (c) structured input tasks without metapragmatic information (implicit intervention). Structured input tasks force learners to selectively attend to target request expressions through appropriateness judgment and self-confirmation of their judgment while listening to dialogues containing the appropriate expressions. Thus, structured input tasks themselves are implicit in nature and rely on learners' own discovery of pragmalinguistic and sociopragmatic conventions of English requests. The problem-solving tasks involved learners' comparison of appropriate and inappropriate request forms and their analysis of the ways of making inappropriate requests more polite. The results revealed that structured input tasks with metapragmatic information had a lesser degree of effectiveness at the delayed posttest phase, thereby verifying the overall effectiveness of implicit intervention. More importantly, Takimoto's study suggests that maximum increase in both pragmalinguistic and sociopragmatic awareness can be achieved through learner-initiated cognitive activities.

Future Directions

The effect of learner characteristics on pragmatic awareness is one of the promising research topics involving pragmatic awareness. Takahashi (2005) is the only recent study that has directly addressed this issue. Takahashi explored the effects of Japanese EFL learners' motivation and proficiency on their attentional allocation while processing pragmatic input in L2. Awareness was considered to be inherently graded and operationally defined as conscious detection accompanied by different levels of interest in the target features.

Takahashi found that intrinsic motivation—inherent interest in the learning activities—significantly affected learners' awareness of the target bi-clausal English request forms (e.g., "I was wondering if you could VP"); however, this was not the case for proficiency. With regard to proficiency, Matsumura (2003) similarly demonstrated that amount of exposure had greater potential to explicate the development of pragmatic awareness than proficiency. On the other hand, in the area of pragmatic intervention, Codina-Espurz (2008) reported that Spanish EFL learners with higher proficiency were able to attain a more balanced use of various mitigation devices in requests than learners with lower proficiency under a particular intervention, thereby evidencing the direct effect of proficiency. Similar approaches need to be adopted in future research. Needless to say, other learner-attributable variables such as aptitude and learning strategies should also be examined as part of our continuing efforts to grasp a more accurate picture of the role of pragmatic awareness in developing L2 pragmatic competence.

Pragmatic Competence in Multilingual Contexts

MARIA PILAR SAFONT JORDÀ

Pragmatic competence is considered a main component of the global construct of communicative competence and it has been defined as “the competence in conveying and understanding communicative intent” (Celce-Murcia, Dörnyei, & Thurrell, 1995, p. 17) and as “knowledge on how to perform common speech acts and speech act sets” (Celce-Murcia, 2007, p. 48). Due to the fact that communicative competence is the most relevant outcome in teaching and learning languages, special attention has been paid to the development of language learners’ pragmatic competence in the last 20 years. Such a focus has given rise to the discipline of interlanguage (IL) pragmatics. However, despite the vast amount of studies analyzing IL pragmatic development (see Alcón, 2008, for an overview), only a few have considered the multilingual background of language learners. This entry will focus on the need to analyze pragmatic competence of multilingual speakers by presenting an overview of the studies conducted so far on this topic.

Pragmatic Competence in Multilingual Contexts: A Focus on Learners

Interlanguage pragmatics has adopted and adapted the main tenets of L1 pragmatics and L2 acquisition research. In this way, Brown and Levinson’s (1987) politeness theory or Leech’s (1983) account of the use speech acts serve as the basis for the analysis of L2 learners. Following SLA tradition, L2 learners are all considered within the same learner group, the only subdivision may refer to the learning context, that is, whether they are learning the language in the target speech community or not. The former case would include immigrants or second language learners, whereas the latter case refers to foreign-language learners. Despite this distinction, the knowledge of more than one language, that is, the multilingual background of these learners, has been ignored or scarcely dealt with.

Paradoxically, there seems to be general consensus around the idea that multilingualism is now the norm rather than the exception (Cenoz, Jessner, & Hufeisen, 2001), and that, even though second and third language acquisition are somehow similar, they also present important differences in terms of those processing mechanisms implied (Herdina & Jessner, 2002). Third language acquisition and use is more complex than second language acquisition. As argued by outstanding figures in the field (Jessner, 2006; Dewaele, 2007; Hufeisen & Marx, 2007; Cenoz, 2009), it is not a quantitative but rather a qualitative difference. Furthermore, the peculiarities of third language acquisition and use have been examined from a psycholinguistic (Cenoz, Jessner, & Hufeisen, 2001), educational (Cenoz, 2009), developmental (Quay, 2008), and sociolinguistic (Hoffmann & Ystma, 2004; Shohamy & Gorter, 2009) perspective. They are thus grounded on new theoretical paradigms and empirical findings. The growing body of research on third language acquisition and use includes some studies on the pragmatic development of third language learners and users. These studies have focused on the acquisition and use of speech acts (Cenoz, 2003; Safont, 2005a; Safont, 2005b), learning context (Dewaele, 2007), or use of honorifics (Fouser, 1997).

Cenoz (2003) analyzed the use of requests by advanced university learners of English in the Basque Country. The author focused on ascertaining the intercultural style of learners by focusing on their requesting behavior. Results from the study not only point to the development of a particular intercultural style that relates to the similarity between Spanish and English requests, but also refer to the distance between requests made by English learners in Spanish and those produced by other Spanish speakers.

Another analysis on request behavior is presented by Safont (2005a), who examined the role of bilingualism in English learners' pragmatic production and awareness. Results from this study showed that bilingual students produced more request strategies and identified appropriate and inappropriate request behavior more often than their monolingual counterparts, confirming that (at least in this study) third language learners outperformed monolingual students of English in terms of both pragmatic production and awareness. In line with these results, Safont (2005b) also found differences between bilinguals' and monolinguals' use of peripheral modification devices. More specifically the study showed that third language learners of English employed request modifiers more frequently and appropriately than L2 English learners, supporting Jessner's (2006) assumptions of a highly developed interactional competence in third language learners. Furthermore, according to Herdina and Jessner (2002), new language-learning techniques and skills involved in language use may arise as a result of the qualitative change in third language learners. According to the author, findings in Safont's (2005b) study are in line with Herdina and Jessner's (2002) dynamic view of multilingualism, as skills involved in making use of appropriate request behavior (including mitigation devices) appeared more developed in learners of English as a third than as a second (foreign) language.

Nevertheless, we should bear in mind the fact that only one speech act (requests) has been examined in the third language learning setting (Cenoz, 2003; Safont, 2005a, 2005b). In order to present a thorough analysis of pragmatic behavior in multilingual learners, other speech acts and pragmatic aspects need to be studied, addressing the complex nature of multilingualism. See for example the study of the learning context and role of situational factors in communication by Dewaele (2007), and the use of honorifics by third language learners by Fouser (1997).

In all the above-mentioned cases an SLA research-based design was adopted. The former group of studies used questionnaires that elicited the target pragmatic or pragmatic-related item. However, other research designs may fully account for the multilingual nature of language use and thus best serve the purpose of examining the pragmatic behavior of multilingual speakers. An example of other research designs leads to the methodology employed in studies conducted on early pragmatic development in multilingual children. In these studies the multilingual nature of communication is taken into account.

Early Pragmatic Development in Multilinguals

Children's pragmatic development has been examined from a cross-sectional and a longitudinal perspective. Cross-sectional studies focus on the analysis of classroom discourse (Gumperz & Cook-Gumperz, 2005; Cots & Nussbaum, 2008) and pay attention to issues like identity construction and multilingual communicative competence. Longitudinal studies analyze multilingual children's pragmatic development by focusing on the use and comprehension of their languages at very early stages (Montanari, 2009; Quay, 2008).

Gumperz and Cook-Gumperz (2005) analyzed bilingual children's code-switching behavior in the classroom by adopting an ethnographic approach. The authors contrasted monolingual and bilingual communication to demonstrate that bilingualism may be seen as a resource for achieving communicative goals. In their opinion, code switching should not be treated

as an independent phenomenon, but rather as a constituent of classroom-generated discourse in the case of bilingual children. As suggested by Gumperz and Cook-Gumperz (2005, p. 21), bilingual practices can be best examined through their communicative effects. An example of this area of research that deals with bilingual practice in schools is provided by Cots and Nussbaum's (2008) analysis of multilingual discourse in the English classroom. The authors describe the interactional profile of two young immigrant students in Catalonia by focusing on their institutionally affiliated communicative competence. Through an interactionist approach to the data collection and analysis, the authors examine their participation in the institutional context. Gumperz and Cook-Gumperz concluded that, while their subjects' level of communicative competence in English could be considered very low (according to traditional standards that are strictly based on competence in one language), their institutionally communicative competence was acceptable.

A change in the research paradigm adopted in the analysis of language learners' pragmatic competence was also suggested by Kasper (2007). The author advocated for a conversation-analytic perspective in examining pragmatic transfer, including that of multilingual speakers. In line with Kasper's proposal, recent analysis of early pragmatic development in multilinguals has adopted a more ethnographic and interactionist methodology. This research method differs from the traditional paradigm in interlanguage pragmatic development to account for multilingual pragmatic development. In other words, the focus in those studies dealing with early pragmatic development is not on the appropriate use of one of the participants' known languages, but on all of them. More specifically, studies like those of Quay (2008) and Montanari (2009) focused on whether multilingual children could differentiate their languages pragmatically. These two studies suggested that, even before the age of 2, multilingual children are aware of the linguistic background of their interlocutor and may adapt their production accordingly.

Proposals for Analyzing Pragmatic Competence in Multilingual Contexts

As mentioned in the previous sections, existing studies on the pragmatic competence of multilingual users provide us with insights on the peculiar characteristics of third or additional language acquisition, as follows. First, bilingual speakers learning English as a third language present their own intercultural style (Cenoz, 2003) and their skill in identifying appropriate requestive behavior is further more developed than in the case of monolingual learners (Safont, 2005a). Second, it has been demonstrated that the learning context and situational factors influence the perceived oral competence in the additional language (Dewaele, 2007). Third, there exists some evidence that language distance affects pragmatic transfer as far as the use of honorifics is concerned (Fouser, 1997). In addition, the adoption of interactionist research methods in the analysis of multilingual behavior shows that bilingualism may be regarded as a resource for achieving target communicative goals (Gumperz & Cook-Gumperz, 2005) and, thus, identity construction may be further examined in the language classroom (Cots & Nussbaum, 2008) even with beginner language learners. Finally, it has been demonstrated that early trilingual users may differentiate their languages pragmatically even before the age of 2 (Quay, 2008; Montanari, 2009).

The above findings open new research goals in interlanguage pragmatics by considering a well-known fact: The world is multilingual. Therefore, the adoption of a monolingual and monocultural perspective in analyzing pragmatic development may provide us with only a partial account of the linguistic phenomenon under study. Such a monolingual view is considered when multilingual language learners' performance is contrasted with that of native speakers of one of the languages. As argued by House (2007), the aim of these

learners is not to become a native speaker, rather an expert user of the language. In the same vein, Dewaele (2008) argues for a focus on multicompetent users of an additional language and on their own subjectivity, which may be reflected in their pragmatic use. In line with these views, the notion of communicative competence has been challenged as it takes monolingual competence in the target language as the desired outcome of any language course. There is then a need to revise the underlying assumptions of actual pedagogical models, considering the learner as an intercultural mediator (Alcón, *in press*).

Particular characteristics of these language learners have been considered in multilingualism studies (Todeva & Cenoz, 2009). Yet, as raised by Aronin and Hufeisen (2009), new research paradigms should be adopted to move toward the second threshold in multilingual studies. These authors argue for the need to adopt new methodological perspectives in the analysis of multilingualism. According to these authors, the complexity of multilingualism may be best described and identified by conducting a thorough analysis of reality. Methods considering speakers' symbolic competence may well serve this purpose (see complexity theory or dynamic systems theory). Therefore, the analysis of multilingual learners' pragmatic competence could and should follow this new perspective. In fact, Kramsch and Whiteside affirm that "multilingual environments can elicit complex relationships between speech acts and their perlocutionary effects" (2008, p. 662). They link such complexity to studies which allow for the analysis of symbolic competence. Such competence could be defined as "the ability to shape the multilingual game in which one invests and to reframe human thought and action" (2008, p. 664). In other words, symbolic competence refers to the particular ability that multilinguals show to play with various linguistic codes and with various temporal and spatial backgrounds related to these codes.

Symbolic competence thus allows for the adoption of a multilingual perspective in the analysis of multilinguals' behavior. This perspective may then enable us to provide further insights into the pragmatic development of third language learners and users. Issues like identity construction in the language classroom or pragmatic differentiation in early third language learners may also benefit from a more comprehensive analysis following this new research approach.

Conclusion

The inherent complexity of multilingual discourse (Aronin & Hufeisen, 2009) and existing findings on the particular characteristics of pragmatic development in multilinguals calls for new research paradigms as acknowledged by researchers in the field of second language acquisition (Kramsch & Whiteside, 2008), interlanguage pragmatics (Kasper, 2007), and multilingualism (Aronin & Hufeisen, 2009; Todeva & Cenoz, 2009). On the basis of these authors' proposals, the analysis of learners' symbolic competence and, thus, the adoption of a multilingual and ethnographic approach has been proposed. Nevertheless, empirical studies are needed that corroborate this idea. As a suggestion more studies on early third language pragmatic development would be useful since they would create the need to examine the learning and use of additional languages in instructed contexts, analyze institutional discourse and identity construction, and further study early pragmatic development and differentiation in multilinguals. A more ethnographic and interactionist approach is needed in the analysis of language learners' pragmatic development (Bardovi-Harlig & Hartford, 2005; Kasper, 2007). However, such an approach should also adopt a multilingual perspective (Aronin & Hufeisen, 2009), as may be provided by considering learners' symbolic competence. Results from this investigation would contribute to broadening the scope of research on pragmatic competence in multilingual contexts.

Pragmatic Development in Study-Abroad Contexts

TIMOTHY HASSALL

Study abroad, in which students spend a term or longer in the target culture while taking formal classes in language or content (or both), is the keystone of many academic programs. Folk wisdom is that study abroad enables learners to acquire a second language (L2) with great success. Research over several decades does in fact bear out that belief to a large extent (see Freed, 1995). It shows that study-abroad learners by and large do improve a good deal in some areas of language, particularly in overall fluency of their speech. Only during the last fifteen years or so, however, have researchers begun to look specifically at their acquisition of pragmatics. Pragmatics intuitively seems an aspect of language learning which would benefit particularly well from study abroad. After all, living in the target culture can offer the opportunity to participate in and observe a wide range of informal interactions in authentic contexts, which is seldom true of the L2 classroom back at home. How well, then, do L2 learners acquire pragmatics during study abroad? How also do they acquire it?

What Learners Acquire

Learners certainly do acquire some pragmatics during their study abroad. This is shown by studies of diverse learners of various target languages (e.g., US English-speaking learners of Spanish in Felix-Brasdefer, 2004, and Japanese learners of English in Matsumura, 2003). Furthermore, when such studies explicitly compare their pragmatic development with that of a control group of at-home L2 learners they consistently find the study-abroad learners to make greater gains.

Routines

The most marked success is in acquiring pragmatic routines. This means formulaic expressions used in performing various speech acts (e.g., in this writer's variety of English: "Hi," "Can I have . . . ?" "Sorry about that," "Would you like a . . . ?" "No thanks," or "See you later"). Many studies show a rapid development in this respect. Low-level Australian adolescent learners developed a wide variety of Japanese routines for opening and closing requests and interviews (Marriott, 1995). Similarly, low-level American learners of Spanish acquired much ability to use routine formulas for a range of functions, including opening and closing encounters (Lafford, 1995). Beginning and intermediate learners of Indonesian also acquired a wider range of greeting routines during a short sojourn (DuFon, 2000). Advanced Irish learners acquired some appropriate German routines for making requests and offers and for refusing offers (Barron, 2003), and advanced American learners of French developed a range of routines for taking leave (Hoffman-Hicks, 2000).

Informal Style

Another noticeable gain by study-abroad learners is that they develop some command of informal speech style. Marriott's (1995) Australian learners of Japanese learned to use plain

DOI: 10.1002/9781405198431.wbeal0928

speech style as opposed to polite honorific style, which had been the only style they knew before their sojourn. US learners of French improved their understanding of colloquial French words and phrases (Kinging, 2008). American adolescent learners of French also reported considerably more confidence in their ability to converse in an appropriate style with French teenagers at the end of the sojourn than they did at the beginning (Lapkin, Hart, & Swain, 1995).

Sociopragmatics

Some groups of study-abroad learners also show development at the social “end” of pragmatics. This refers not to command of the language forms themselves but rather to the ability to assess the social context in an L2-like way in order to decide what forms are appropriate to choose (e.g., gauging the relative status of speaker and hearer before deciding how to word a request). This type of L2 pragmatic knowledge is generally thought to be hard to acquire, especially outside the target culture (see Kasper & Rose, 2002; Barron, 2003). There is evidence that study abroad can enable learners to acquire a certain amount of it. For instance, Japanese learners of English developed more L2-like perceptions of how much weight to lend to relative social status of speaker and hearer in deciding how to give advice to certain interlocutors (Matsumura, 2003). American learners of Spanish developed more L2-like perceptions of how an interlocutor’s higher status affected the way to express refusals to that person (Felix-Brasdefer, 2004). Some American learners of French also developed a more L2-like understanding of the social norms underlying the choice between the personal pronouns *tu/vous* (Kinging, 2008).

Modifiers

Study-abroad learners show development in other aspects of pragmatics as well, although less obviously. Take for instance the feature of “modifiers”: elements added to a speech act to soften or intensify its force. One might insert appropriate words and phrases as modifiers (e.g., asking in English “Could you *possibly* give me a lift?” or saying “I *really* liked your talk”). Or one might add extra moves to modify the force of the speech act that way (e.g., by apologizing when you knock someone over with “Oh, I’m sorry! *Are you all right?*”). Several studies show learners’ use of modifiers to become more L2-like in some respects at least. Irish learners of German stopped using *bitte* ‘please’ so much to modify their requests and started softening them with other words instead, such as *vielleicht* ‘perhaps’, for example, to ask whether the addressee could *perhaps* give them a lift home (Barron, 2003). American learners of Spanish and French began to use conditional verb forms more often to soften their requests, for example, to ask “*Would* it be possible to . . . ?” (Cohen & Shively, 2007). Some German learners of English added a wider range of moves to support their requests, such as the expression of consideration “I hope you don’t mind” in asking to postpone a meeting with a friend who has taken trouble to schedule it (Schauer, 2009), and Austrian learners of French stopped adding justifications for their own behavior so often when performing apologies (Warga & Schölmlberger, 2007).

Global Sensitivity

As for general sensitivity to pragmatics, there is evidence that study abroad helps to raise it. German learners of English in one study became a good deal more skilled at detecting various pragmatic errors by the end of their study-abroad sojourn, and also came to regard errors of pragmatics as more serious than they formerly did (Schauer, 2006). This type of raised awareness of pragmatics has also been found among L2 learners who spend prolonged periods in the target culture outside study abroad (Bardovi-Harlig & Dörnyei,

1998).

Factors Affecting Acquisition

Study-abroad learners definitely do acquire some pragmatics, then, and often have impressive success. At the same time, their gains tend to be perhaps more modest than one might expect. For example, at the end of a sojourn their use of pragmatic routines still tends to be markedly non-L2-like. The advanced learners of German in Barron (2003), for instance, continued to use some inappropriate pragmatic routines when making offers, and in fact used some inappropriate ones more frequently as the sojourn went on. Similarly, the author of one large study of American learners of French finds their overall pragmatic progress during the 10-month sojourn to be fairly limited in scope (Hoffman-Hicks, 2000). Let us now consider what factors most affect learners' acquisition of pragmatics. This will shed some incidental light on why pragmatic gains during study abroad are not uniformly dramatic, as well as on the much-remarked fact (see Kinginger, 2008) that study-abroad learners vary greatly in their individual progress in acquiring L2 pragmatics (and in acquiring L2 more broadly).

Input

A crucial factor in acquiring pragmatics during study abroad is the amount and quality of pragmatic "input." This means information about pragmatics which the learner is exposed to during the sojourn. If one notices a piece of pragmatic information, and notices how it differs from one's own L2 pragmatic behavior, one can then potentially modify one's behavior in line with that input (see Schmidt, 1993). The main source of input about pragmatics during study abroad is participating in and observing informal interaction with L2 natives. Researchers regularly point to such input as crucial in enabling the pragmatic developments which learners make. For example, Marriott (1995) largely attributes the impressive pragmatic gains made by a group of adolescent learners of Japanese to the "massive amount of exposure to Japanese" (p. 220) which they received in their L2 environment, including "large amounts of comprehensible input and interaction" (p. 220). Matsumura (2003) finds that the amount of exposure his learners had to English during their stay in Canada (as well as before they arrived) directly affected the size of the pragmatic gains they made. Similarly, the detailed studies by Barron (2003), DuFon (2000), and Hoffman-Hicks (2000) all conclude after close analysis that the frequency and salience of the input received by their learners was crucial to how well they acquired a range of pragmatic features. (Input is crucial for acquisition of the L2 more broadly as well, and so is "output," which means use of the L2. This concomitant need for output is also acknowledged by L2 pragmatists, as by Marriott (1995) above when she asserts the value of "interaction." Interaction provides learners with both input and output.)

The target culture can sometimes be a poorer source of pragmatic input than one might think. Studies such as those cited above often identify some inadequacy in the input as a key limitation on their learners' progress. First, certain types of input are likely to be scarce for technical reasons. Learners typically lack input in those features which they are expected to use but which interlocutors do not use back to them. Examples of such features are address terms in languages such as Indonesian (see DuFon, 2000) or address honorifics in Japanese (see Marriott, 1995). Because these features are not used in talk which is addressed to the learner, the learner does not have a chance to notice them. Also, because L2 natives often talk to learners differently from how they would talk to each other, learners may receive input from their interlocutors which does not reflect actual L2 pragmatic norms, for example, US English-speaking learners of Japanese in Iino (2006). Learners also tend

to receive little corrective input or overt correction of their socially sensitive pragmatic errors (see DuFon, 2000). L2 natives might well notice socially sensitive errors the learner makes but tend to be reluctant to draw the learner's attention to them, so learners are not helped to notice them.

A second and more far-reaching cause for lack of input is the fact that some study-abroad learners end up having little interaction with L2 natives outside the classroom—often a good deal less than they had planned before departing. Take, for example, the common study-abroad practice of living in a “homestay.” Some L2 learners find this living arrangement an invaluable source of social interaction, but many others end up talking little with their host family, for a range of reasons (see e.g., Wilkinson, 1998). More generally, the learners may make little or no effort to seek out interactions with natives and may reject opportunities to interact when they do arise (see Pellegrino, 1998). Learners may behave like this for a wide variety of cultural, social, and psychological reasons. See, for example, accounts of individual learners observed by Wilkinson (2000) and by Kinginger (2008). They respond to the experience of the target culture in very different ways, some of which curtail the amount and range of input about L2 pragmatics they can obtain.

Motivation

This matter of input is closely tied to another important factor—that of motivation. While it is unhelpful and will often be untrue to brand those study-abroad learners who avoid interactions with L2 natives as “lazy,” it is fair to say they lack motivation to learn the language. They lack that degree of motivation which would lead them to desire and to seek out L2 interactions purely for their language learning value, regardless of whether they actually “felt like it” at the time. Their limited motivation to acquire the language prevents them from obtaining as much and as varied pragmatic input as they otherwise would. Conversely, study-abroad learners with very high motivation to learn the L2 are likely to seize opportunities to interact intensively with L2 natives and thereby gain access to very rich pragmatic input, even overcoming structural disadvantages such as an input-poor home environment (see Kinginger, 2008, for a case study of such a learner of French). The two factors of motivation and input interact in another way as well, to affect acquisition of pragmatics. Learners who are more highly motivated to learn pragmatic aspects of the language as opposed to purely formal aspects are more able to notice the pragmatic input which they are exposed to during their sojourn (see DuFon, 2000).

Identity

Something else that affects how learners acquire pragmatics during study abroad is how they perceive their identity within the target culture. Do the learners feel comfortable with the social roles and language practices expected of them by L2 natives? Conversely, do they wish to position themselves within the target culture in a way that conflicts with those expectations? To the extent that the second thing is true, learners may not acquire ways of speaking which L2 natives would consider appropriate. They might pay little attention to pragmatic input which reflects cultural values they do not wish to adopt, and so learn little about the relevant pragmatic features—for example, an American learner of Indonesian who cared little about the hierarchical complexities of the L2 address term system (DuFon, 2000). Even if they do learn how to use the pragmatic feature in an L2-like way, they might deliberately not do so in order to follow their chosen way of presenting themselves within the target culture—for example, a US learner of French who opted for a non-L2-like choice of pronoun to address French equal-aged peers (Kinger, 2008).

Length of Stay

A final factor to mention is length of sojourn. How long do learners need to stay abroad to acquire pragmatics? We must qualify any answer with caveats. First, study-abroad learners do not acquire pragmatic features in a neat linear way. Instead of simply moving ever closer to the L2 norm for a given feature, they may even move further away from that norm (see e.g., Barron, 2003). Moreover, as mentioned, learners do not always *aim* for L2 native pragmatics. They sometimes resist certain L2 pragmatic practices and choose to perform in a non-native-like way instead (e.g., in Barron, 2003; Kinginger, 2008). Finally, as we know, learners are still not L2-like in their competence by the end. Those things said, learners seem to start acquiring pragmatics early in their sojourn. Within two or three months they can become a good deal more competent in using a range of routine formulas especially (e.g., Hoffman-Hicks, 2000). Other isolated pragmatic gains have been noted to occur equally rapidly, such as acquiring a more L2-like structure to some speech act exchanges in German by learning not to re-offer when an initial offer is declined (e.g., Barron, 2003). Similarly, one group of Japanese learners needed only around two months in England to gain some knowledge of the social factors underlying appropriate choice of advice forms (Matsumura, 2003). Moreover, pragmatic development appears to be sustained after the early months. For example, learners of German were observed to have made various pragmatic gains at the end of their 10-month sojourn which they had not yet made at earlier points (Barron, 2003). In short, learners seem to start acquiring pragmatics early and to keep making progress for as long as their sojourn lasts.

Conclusion

Study abroad seems to promise a great deal for learners of L2 pragmatics but to deliver slightly less. It seems that simply “being there” is not enough. One way to maximize the learning of pragmatics during study abroad is to combine it with classroom support. As Kasper and Rose (2002) say, the language classroom has some advantages over the informal L2 target culture environment as a place to learn L2 pragmatics, as teachers can, for example, explicitly model pragmatic features and raise learners’ awareness of features through systematic activities. Kasper and Rose (2002) argue that learners would benefit from explicit teaching of pragmatics before departure, combined with formal courses in the host setting which encourage them “to discuss and reflect on their experiences with L2 interactional practices” (pp. 233–4). This can prepare students for the differences they will find and help them to make sense of their encounters with the target culture. Without this kind of preparation and support, as Kasper and Rose (2002) observe, development of L2 pragmatics can be “slow and partially unsuccessful” (p. 234).

Pragmatic Markers

JESÚS ROMERO-TRILLO

Pragmatic Markers

Pragmatic markers can be described as those constructions, such as *you know, I mean, you see, well, yeah*, that are present in speech to support interaction but do not generally add any specific semantic meaning to the message. They can be defined as those elements of language that have modified their original propositional meaning and have adopted a communicative status that weaves the net of discourse between the addressor, the addressee, and the context of a given message. Obviously, this definition is inextricably linked to the approach selected here for the understanding of pragmatics as a linguistic discipline. In general terms, two main traditions in the study of pragmatics can be found: the first describes what pragmatics does, for instance Mey (1993, p. 4), "Pragmatics tells us it's all right to use language in various, unconventional ways, as long as we know, as language users, what we're doing"; the second tradition describes the essence of pragmatics with analogous categories to other fields of linguistics, as in Leech (1983, p. 6), "the study of meaning in relation to speech situations." For the study of pragmatic markers, the former definition seems more appropriate than the latter—more scholastic—as it places the emphasis on what I consider to be the three essential components in the study of pragmatic markers: appropriateness, the status of the language user, and the description of language in context. In this sense, pragmatics can be characterized as a discipline whose span is beyond other branches of linguistics (phonology, grammar, or semantics), but functions in coalition with them. In other words, there cannot be a pragmatic meaning without an original linguistic meaning that has suffered some transformation as a result of its contact with reality.

In recent years, the description of pragmatic markers has been in conflict with the characterization of discourse markers. One of the most influential contributions in this respect can be found in Fraser (1999) who described discourse markers as:

A class of lexical expressions drawn primarily from the syntactic classes of conjunctions, adverbs and prepositional phrases. With certain exceptions, they signal a relationship between the interpretation of the segment they introduce, S2, and the prior segment, S1. They have a core meaning which is procedural, not conceptual, and their more specific interpretation is "negotiated" in the context, both linguistic and conceptual. (Fraser, 1999, p. 931)

This definition contrasted with Schiffrin's description of these elements published in her seminal volume (1987, p. 31): "Markers are sequentially dependent elements that bracket units of talk." As observed, these definitions depart from divergent positions, while Fraser is more concerned with the intra-textual relationship of the markers Schiffrin is primarily interested in their extra/contextual and interactional relationships.

These conflicting views were also represented in the names assigned to discourse markers by different scholars: cue phrases, discourse connectives, discourse operators, discourse particles, discourse signaling devices, phatic connectives, pragmatic connectives, pragmatic

expressions, pragmatic formatives, pragmatic markers, pragmatic operators, pragmatic particles, semantic conjuncts, sentence connectives, or continuative elements. After much scholarly discussion on the identification of the best term to describe this linguistic phenomenon, the course of history has practically reduced all these labels to the duet *pragmatic markers* and *discourse markers*. What seems important from a retrospective perspective is that this myriad of names evoked the different angles of study that discourse markers have inspired and, consequently, the multiplicity of functions they can realize in speech from a communicative and structural stance.

For many linguists nowadays, the term pragmatic markers has been widely accepted as the superordinate category for those elements that are present in discourse and whose meaning resists truth-conditional interpretation (see Levinson, 1983), although other approaches would make a clear distinction between both categories. In this sense, discourse markers are the elements that typically establish the link between a clause and its preceding or forthcoming one from a textual perspective. In other words, discourse markers connect adjacent units of information to signal, for example, contrast (*but*), consequence (*so*), or time/logical transition (*then*). For this reason, discourse markers need to appear in first position, and their primary aim would be to structure information in discourse dynamically. Pragmatic markers, on the other hand, are considered to be the elements that remain outside the propositional content of a sentence and serve to establish the relationship between the speaker and the message as, for instance, in the case of interjections, “damn . . . boy . . . gosh . . . jeez” (Norrick, 2009), or in the expression of appraisal or evaluation, “amazingly . . . sadly . . . fortunately” (Aijmer, 2008). As mentioned above, some linguists will opt for the inclusion of discourse markers as a category of pragmatic markers, while others prefer to distinguish both categories to differentiate discourse meaning from pragmatic meaning.

The Structure of Pragmatic Markers

In the description of pragmatic markers, three primary features can be identified. First, they have a distinct prosodic entity when they appear in first position, that is, they are not pronounced inside the same tone group as the message they accompany. However, they usually appear embedded in the same tone group if they are used at the end. Second, they do not have a specific semantic meaning, that is, their original propositional meaning has been blurred through a process of grammaticalization; for example, the use of *you know* as a marker does not involve any cognitive appraisal as its canonical use would imply. Third, pragmatic markers contribute to scaffolding the pragmatic coherence of the discourse through a triangulation strategy that takes into account the addressor, the addressee, and the message through positive feedback. From these three necessary conditions I think that the first, prosodic autonomy, is the most important from a communicative perspective as the tone group, by definition, realizes a unit of information through the tonic—the most salient stress (Halliday, 1967). This explains why some undefined elements, that is, *ahm*, *er*, *mm*, and others, although initially void of semantic meaning, have pragmatic implications in the interaction. In other words, prosodic autonomy shows that these markers acquire a meaning—pragmatic not semantic—and become essential elements in the transmission of information from a communicative perspective, with a distinct cognitive role in the structuring of information (Romero-Trillo, 1994).

The second condition of pragmatic markers, blurred semantic meaning, is directly related to the notion of grammaticalization that I would like to complement with the notion of “discourse grammaticalization” (Romero-Trillo, 2001), that is, when an element assumes

a pragmatic dimension for interactional purposes that differs from its original semantic meaning and grammatical behavior. In other words, a discourse-grammaticalized marker becomes a homonym—that is, a word that has the same form but differs in meaning—in a particular synchronic system that, when appearing with a pragmatic function, constrains the relevance of the proposition it introduces and loses its original meaning (Hopper & Traugott, 1993).

As regards the identification of the linguistic elements that can pertain to the category of pragmatic markers, we must aver that it is difficult to apply classical linguistic categories, that is, verbs, adjectives, nouns, or adverbs, for their classification. In fact, the study of pragmatic markers shows that even the prototypical examples used by linguists to exemplify their status belong to different language categories: adverbs (*well*), verbs (*look*), interjections (*oh*), nouns (*man*), and then the numerous combinations of unfinished clauses (*you know*, *I mean*), and complex clauses (*if you see what I mean*).

To clarify this point, Romero-Trillo (2001, p. 532) proposed the following classification of pragmatic markers:

- Acategorical items: *yeah*, *yep*, *m*, *mmm*, etc.
- Lexical items: *listen*, *well*, *good*, *fine*, etc.
- Lexical composites: *I mean*, *you know*, *the thing is*, *oh my God*, *if you see what I mean*, etc.

This classification illustrates the enormous diversity of origins and forms that pragmatic markers adopt and also hints at the variety of functions that they can realize as will be explained below. Furthermore, the multiplicity of elements that can appear in the same position would lead to the conclusion that there is no theoretical limit to the array of expressions that could function as a pragmatic marker: any element and its combinations. In fact, this hypothesis poses a serious theoretical problem: Can the new linguistic category of pragmatic markers be so alien to any traditional linguistic description?

The proposal presented here is to classify pragmatic markers as a definite category, that is, regardless of their original word-class (nouns, phrases, interjections, etc.). In our model pragmatic markers function in a dynamic system that we shall term “triangulation,” in which the addressor, addressee, and the message are in continuous feedback. For this purpose we need to use a cognitive model—in which the addressor’s and addressee’s mental states are considered (Romero-Trillo, 2001)—because, if pragmatic markers have a different grammatical nature from classical word-classes, this will necessarily affect their linguistic behavior. In this cognitive model, pragmatic markers are elements that fill the discourse slots that (spoken) language needs to scaffold the cognitive net of interaction. The term “spoken” appears in brackets because these markers are characteristic of speech, although some might also appear in writing. In fact, of the three defining features mentioned above, two—independent prosody and triangulation—typically appear in spoken language. Therefore, this cognitive approach is geared to the description of the markers as cognitive components of language understanding, and of adaptive management in conversation. This cognitive approach is by definition dynamic in as far as its aim is not the classification of markers in a closed-class repertoire or the description of their local behavior. On the contrary, the aim of this model is to define the cognitive constraints or features that will allow the appearance of a pragmatic marker in a certain position, bearing in mind that the markers can be manifold for one single cognitive slot, that is, *you know*, *you see*, or even *mmm* can appear in the same position and with the same function as *yeah*, *yep*, or *well*. In fact, the plurality of elements for the same slot makes it very difficult to identify the nuances of the pragmatic differences of these markers, which, incidentally, may lie on extra-linguistic reasons such as age, social class, context, and so on.

The Meaning of Pragmatic Markers

The indefiniteness of this situation compels linguists to account for the two main difficulties in the description of pragmatic markers: first, is there a “prototypical meaning” for each marker, in other words, is it possible to define the use of *well*, *you see*, or *mhm* as we would do with other linguistic items such as *house*, *cat*, or *river*? Moreover, can we give a definition for a pragmatic marker, for example, *my God*, that is different from its use as a noun phrase in a subject/object position? The second point at stake can be formulated as follows: Is there an “accepted” repertoire of discourse markers for each language? In other words, what are the necessary conditions for including an element in the open-class category of pragmatic markers?

The question of a prototypical meaning poses many problems, as many pragmatic markers appear in a multiplicity of functional contexts and with different meanings. As a result, it is difficult to assign a core meaning for each marker, especially in the case of acategorical elements such as pause markers and interjections. Second, with regard to the elaboration of an accepted repertoire, what we find in discourse is not just a series of pragmatic markers but a series of cognitive slots filled by elements that function as a pragmatic markers, as long as they fulfill the three conditions mentioned above: prosodic autonomy, pragmatic meaning through discourse grammaticalization, and triangulation process during the interaction. In other words, the phenomenon of pragmatic markers shows that spoken interaction needs to have a pragmatic skeleton with cognitive slots that holds the communicative force of the interaction together. These slots are filled by elements that may vary according to regional, idiolectal, or sociolinguistic features of the language. This perspective accounts for the diversity of the markers, but at the same time links their appearance to the existence of the cognitive slots in the web of communication and, based on this premise, the system allows participants to innovate their interaction with the coinage of new markers. As it is frequent in all language processes, the more a pragmatic marker is used—and becomes discourse-grammaticalized—the less its original meaning can be traced. This is the reason why speakers need to find new expressions that contribute to the novelty of language to avoid clichés.

The difficulty, then, is how to account for the alternative options that speakers have, for example, for showing feedback in a certain situation, for self-correction, for drawing someone’s attention, for expressing surprise, and so forth. In other words, how can we prove that the use of one expression as a pragmatic marker for a certain function is appropriate? This is a complex issue because, as mentioned above, in some cases a cognitive slot can be realized by several markers. To account for this issue we can use the notion of “discourse appropriateness” (Romero-Trillo, 2001, p. 531), defined as “the possibility to choose the most adequate element in the realization of a certain function in a specific context.” In other words, a certain function, like feedback, can be realized through several markers but not all of them are equally appropriate depending on issues dealing with context, age of the speakers, accompanying elements, or the presence or absence of emphasis, amongst other features. Therefore, the choice of pragmatic marker is not automatic and the more a function is present in interaction, the greater the variety of markers at the speaker’s disposal. To elucidate the appropriateness of a marker we can use the notion of specificity indexes: the relation between the realization of a function or element divided by the total number of occurrences. This measure determines with mathematical adequacy the specificity of a marker in the realization of a function, and the repertoire of elements that can realize a certain function through the “specificity index of elements” and the “specificity index of functions.” By using the notion of appropriateness, we assume that the use of a particular form in discourse cannot be ascertained from any kind of grammatical/semantic assessment, in fact many markers do not belong to any particular grammatical category,

or their original meaning has been blurred. Appropriateness is based on the idea that pragmatic markers can be assigned to a specific function on the basis of their relative frequency in that position, thus creating a positive feedback relationship between function and marker, only altered when a new element enters a category for language creativity purposes.

Pragmatic Markers Across Languages and in Language Acquisition

How universal are pragmatic markers? In other words, do all languages have some elements that fulfill this function? Many scholars have pondered on this issue and have described the presence of these elements in various languages that seem to organize their appearance and distribution differently. For instance, in the case of the use of markers that derive from verbs to draw the attention of the addressee, it can be stated that speakers prefer the use of elements that derive from processes of visual perception, *look* (English) or *mira* (Spanish), instead of the use of verbs that deal with the hearing capacity, *listen* (English) or *escucha/oye* (Spanish), due to a metaphorical strategy aimed at not being too face-threatening. In the same vein, another finding is that Spanish is more prolific than English in the overall use of these attention-getting elements for various cognitive reasons (Romero-Trillo, 1997). Through this kind of studies linguists can determine the cognitive mapping of the interpersonal relation between speakers and hearers in the communicative act across languages, as also shown—for instance—in Aijmer and Simon-Vandenberg (2006).

A closely related field of interest in the description of pragmatic markers is their role and evolution in the acquisition of a second or foreign language. If languages show a different patterning in the use and distribution of these elements, how can a learner adopt these patterns in the target language? This issue is of special importance as pragmatic markers have the function of elaborating the message from a cognitive stance (operative function) and of texturing the contextual and interpersonal relationships (involvement function) (Romero-Trillo, 2004). The development of pragmatic markers, as opposed to other areas of language, occurs basically in real interaction, as Kyratzis and Ervin-Tripp (1999) have shown, and native and non-native speakers of a language have divergent use of these elements (Müller, 2005). In fact, one of the problems that can appear in the linguistic evolution of L2 learners is the dissociation between the grammatical, lexical, and syntactic competence and their pragmatic competence, especially if the learning process occurs in non-natural contexts. This phenomenon, that has clear repercussions in real communication, has been defined as “pragmatic fossilization” (Romero-Trillo, 2002). The teaching of pragmatic phenomena is a difficult task in classroom settings as the students are embedded in an unnatural context and, as a consequence, the interaction might follow the grammatical and lexical guidelines of the target language and the pragmatic skeleton of the interlocution may often retain the features of the first language especially in the distribution of pragmatic markers. This phenomenon does not only affect language learners but also teachers with a deficient experience in the pragmatics of the target language (Llinares-García & Romero-Trillo, 2008), or with little or no experience of learning a language in the L1 classroom context. One of the risks of the use of the pragmatic markers in the L2 is their overabundance in quantity but their reduced diversity, which entails a reduction in the cognitive extension and richness of the message. In practical terms, this results in a deficit of pragmatic competence that might provoke miscommunication, as the resulting pragmatic “consense” (Kecskes, 2008) does not match the expectations of the native speaker who finds a disparity between the message and the markers used to scaffold it.

By way of conclusion, pragmatic markers are linguistic essential elements in the communicative process because of their dual role in the architecture of cognition and interaction. Their complex and, at the same time, synergic essence can only be ascertained in relation to different disciplines: discourse analysis and contrastive, developmental, or cognitive linguistics. This is the reason why pragmatic markers are a fundamental topic for research and description in applied linguistics as they portray many of the features that underlie the communicative process.

Pragmatic Routines

KATHLEEN BARDOVI-HARLIG

Have you ever noticed that there are certain times in certain situations where almost everyone says the same thing? Listen to people leaving a party and you may hear them saying to the host, “Thanks for inviting me” or “Thanks for having me.” When people are introduced to each other you might hear “Nice to meet you.” Similarly, when you hear people saying “No problem” or “That’d be great,” you know exactly what they mean, and you probably know just where you would use the same expressions. These expressions are called *pragmatic routines*.

Pragmatic routines are social conventions like shaking hands, waving, or kissing when greeting. Unlike these examples, pragmatic routines are verbal. They are known by many names including *conventional expressions*, a term which focuses on their social value. Coulmas (1981) emphasizes the social aspect of pragmatic routines describing them as “tacit agreements, which the members of a community presume to be shared by every reasonable co-member. In embodying societal knowledge they are essential in the handling of day-to-day situations” (p. 4). Knowledge of conventional expressions forms part of a speaker’s pragmalinguistic competence, and knowledge of their use and the contexts in which they occur is part of sociopragmatic competence.

In this entry, pragmatic routines are considered primarily for their importance as social conventions, hence the alternative label *conventional expressions*. The literature on routines, even in pragmatics, is characterized by many terms for the same concept, and many concepts encoded by the same term (Wray, 2000). One major distinction is between the social characterization of routines (discussed here) and the psycholinguistic characterization. Within the psycholinguistic characterization, terms such as *formulas* and *chunks* emphasize how such expressions are stored and retrieved in the mental lexicon. Following Wray, a formula is

a sequence, continuous or discontinuous, of words or other meaning elements, which is, or appears to be, prefabricated, that is, stored and retrieved whole from memory at the time of use, rather than being subject to generation or analysis by the language grammar. (Wray, 2000, p. 465)

A second psycholinguistic use of *routine* and *formula* which is closely related to the first refers to routines which arise in the course of second language acquisition: “Routines are whole utterances that are unusually error-free and show no transitional stages of development or systematic order of acquisition. They are learned as unanalyzed wholes, much as one learns a single word” (Krashen, Dulay, & Burt, 1982, pp. 232–3). The use of these unanalyzed routines in pragmatics is often thought to decline as interlanguage develops (Barron, 2003). In contrast, use of conventional expressions, often reflecting interlanguage grammatical development, typically increases as learners become more advanced (see “Pragmatic Routines in Second Language Acquisition” below). The psycholinguistic aspects of formulas and routines are treated elsewhere; in general, issues of storage and retrieval are beyond the scope of pragmatic inquiry.

2 PRAGMATIC ROUTINES

The terms *formula* and *conventional expression* may describe the same string of words, but the term *conventional expression* emphasizes a speech community's preference for a particular string and avoids the psycholinguistic claim regarding storage and retrieval. Even the collection entitled "Conversational Routine" (Coulmas, 1981) uses three terms: *routine* (in chapters by Coulmas, Versuschueren, and Laver), and *formula* and *formulaic expressions* (in chapters by Manes & Wolfson, and Tannen & Öztekin). An already full set of terms is somewhat further complicated in pragmatics by the concept of *semantic formulas* (also known as *pragmatic strategies*). Semantic formulas are components of a speech act set and are part of sociopragmatic knowledge. In an apology, for example, semantic formulas include a statement of responsibility ("It's all my fault") and a promise of forbearance ("It won't happen again"), and they need not be expressed conventionally.

Pragmatic routines can be written as well as oral (the conversational routines are discussed here); they can be regional or age-related; and, they can change as the world changes. In many parts of the United States, for example, a speaker who is willing to comply with a request might say "I don't mind" whereas in parts of southern Indiana and Kentucky one might say "I don't care to" with the same effect. There are many examples of different expressions across generations. Consider, for example, that in an elicited oral task in which a friend came to the door the morning after a party, native English-speaking teachers in a university ESL program all referred to "the mess" before inviting the friend in, whereas native English-speaking undergraduate students at the same university did not, inviting the friend in without acknowledging the "untidy" apartment. Finally, the use of conventional expressions changes. Roever (2005) included the expression "Can I leave a message?" which was not elicited from native speakers or learners four years later using the same item involving leaving a message with a friend's roommate (Bardovi-Harlig, 2009), presumably because with the advent of cell phones and voicemail messages are rarely left with a third party. Such examples emphasize the importance of the social contract in conventional expressions.

Identification of Pragmatic Routines

Authors often cite pragmatics as an area in which formulas are frequent. Granger (1998) attributes the growing research in pragmatics as one impetus to study formulas. It is, however, an empirical question as to how formulaic the talk studied in the field of pragmatics really is, and whether all speech acts are equally formulaic. The most immediate issue that falls out from this question is how pragmatic routines should be identified. To this end, characteristics employed by Myles, Hooper, and Mitchell (1998, p. 325) to identify formulas in the study of second language development are relevant (in keeping with the social focus of pragmatic routines the psycholinguistic criteria are not listed, see Myles et al. 1998, for the remaining three criteria). Pragmatic routines are generally:

1. at least two morphemes in length;
2. phonologically coherent, that is, fluently articulated, nonhesitant;
3. used repeatedly and always in the same form;
4. situationally dependent; and
5. community-wide in use.

Whereas it is possible for an analyst to determine whether a string meets the first four criteria (two or more morphemes, phonological coherence, same form, and situational dependence), establishing community-wide use poses a challenge. In the pragmatics literature, there have been three main ways of identifying routines: intuition (e.g., Scarcella,

1979; Nattinger & DeCarrico, 1992), observation of spontaneous conversation, and elicited production. Corpus searches, which are used for investigating formulaic sequences more generally, would be a fourth source for identifying pragmatic routines. The use of intuition is not consistent with the empirical orientation of current pragmatics research.

One of the first studies to investigate the use of pragmatic routines in spontaneous conversation was Manes and Wolfson's (1981) "The Compliment Formula" in which the highly conventional nature of compliment expression was documented. One form—NP {is/looks} (really) ADJ—accounted for 53.6% of the compliments, and with two additional forms—I (really) {like/love} NP and PRO is (really) (a) ADJ NP—accounted for 85% of the 686 compliments collected for the study. Moreover, the positive adjectives (represented by ADJ in the formulas) were dominated by five adjectives which occurred in two-thirds of all the compliments.

Another approach to establishing community-wide use was used by Bardovi-Harlig (2009; Bardovi-Harlig et al., in press) employing a cycle of observation followed by iterations of scenario construction, elicitation, and refinement of scenario contexts. They established a cut-off for "community-wide use" at 50% of native-speaker responses. It is worth noting that not all speech acts are as conventional as compliments. Setting a cut-off level is arbitrary, but setting it too low risks diluting the notion of conventionality or community-wide use, and setting it too high does the opposite, reducing the role that convention appears to play in pragmatics.

A source for future research, although it has not yet been used in pragmatics, would be to identify pragmatic routines in corpora. Working with multi-word units (of which pragmatic routines are a part), Biber, Johansson, Leech, Conrad, and Finegan (1999, p. 990) used 10 occurrences per one million words to define "occurs frequently in a register." Biber, Conrad, and Cortes (2004, p. 376) set a higher frequency level with 40 occurrences per million words. In addition, Biber and colleagues required that the multi-word units occur in multiple texts, which is consistent with pragmatic research. Specific contexts would have to be compared to satisfy conditions on situation-dependency.

Establishing a measure of community-wide use is one challenge to the empirical investigation of pragmatic routines and determining what it means to "say the same thing" is another. In contrast to pragmatic strategies which can be compared on the basis of content, pragmatic routines must be compared on the basis of *form*. Some variation exists across learner and native-speaker samples; one such example is contractions as in "I'm sorry/I am sorry" or "You're welcome/You are welcome" with full forms more prevalent in learner data. However, other variations, such as change of tense occur predominantly in learner data such as "Sorry I'm late/I was late" or "Sorry I forgot/I forget". Pauses might also be considered when establishing equivalents (recall that routines are nonhesitant). Whereas native speakers may say "No thanks I'm just looking" in one breath group, learners may exhibit pauses "No thanks [0.5] I'm just looking." From another perspective, using an interlanguage analysis, it is clear that elements of some routines emerge at lower levels of proficiency; for example "I just look" appears in the same context as "I'm just looking." The inclusion of interlanguage forms would depend on whether a study focused on the well-formedness of the pragmatic routines or indications that learners associate a lexical core with a specific context. Such issues will need to be addressed as research on pragmatic routines develops.

The identification of pragmatic routines serves many goals in pragmatics research: to describe production of a range of populations, to determine targets in second language acquisition, and to provide needs assessments for second and foreign language pedagogy and for related materials development.

Pragmatic Routines in Second Language Acquisition

Research in both L2 development in general (Yorio, 1989; Nesselhauf, 2004) and L2 pragmatics in particular (Scarcella, 1979; Blum-Kulka & Olshtain, 1986; Edmondson & House, 1991; Kasper & Blum-Kulka, 1993; House, 1996; Kecskes, 2000; Roever, 2005) has reported that learners underuse conventional expressions. In L2 pragmatics, Edmondson and House (1991) suggested that learners cannot necessarily handle social situations in the same way as native speakers “because they do not have ready access to, and therefore do not make use of, standardized routines for meeting the social imposition . . . as native speakers do” (p. 284). Kasper and Blum-Kulka (1993, p. 9) have observed, “one area where insufficient control of pragmalinguistic knowledge is particularly obvious is that of pragmatic routines. Coulmas’s (1981) contention that routine formulas are a serious stumbling block for non-native speakers has been supported by nearly every ILP study” (at the time of publication). This is not surprising given that in other areas of applied linguistics researchers describe such conventional expressions as late learned whose mastery may characterize highly advanced learners (Yorio, 1989; House, 1996; Granger, 1998; De Cock, 2000; Foster, 2001; Nesselhauf, 2004).

One way to investigate pragmatic routines in learner language is through production studies. This, in fact, is where most of the evidence comes from, in keeping with most research in interlanguage pragmatics more generally. It is important that language samples be oral, whether elicited or spontaneous, because oral production is where conversational routines occur naturally.

The earliest study to focus explicitly on conventional expressions in pragmatics was Scarcella (1979), which used a written dialogue completion task to elicit 15 conventional expressions from 30 L1 Spanish-speaking second language learners of English. The target items included, among others, “Watch out,” “Happy birthday,” “Come in,” and “I’m sorry.” For each context, the target expression was the head act. The results, which included many circumlocutions, led Scarcella to conclude that adult second language learners have difficulty acquiring very common expressions.

Targetlike production of the conventional expressions generally increases with proficiency level or length of stay, but this too depends on the expression. Some pragmatic routines are learned early. For example, in a cross-sectional study designed to elicit conventional expressions orally (Bardovi-Harlig, 2009), “Nice to meet you” in an introduction was used robustly by low intermediate learners; “You too” in response to “Have a nice day!” was also used at high rates by the same learners. Other pragmatic routines show increased use as proficiency increased: These included “No thanks I’m just looking” in response to “Can I help you?” and “Watch out!” in a warning context. In contrast, “That’d be great” when accepting an offer or “Thanks for having me” when taking leave from a party were not used even by advanced learners.

If production studies show good evidence of use (or nonuse) of pragmatic routines, they are not suited to investigate *why* learners do not produce routines or why routines are the stumbling blocks that Coulmas suggested. To that end, interpretation, judgment, and recognition tasks are informative. Kecskes (2000) investigated whether learners know what conventional expressions mean, employing a dialogue interpretation task which included idioms that had both literal and figurative readings (e.g., “OK, shoot” [go ahead], “Get out of here” [don’t fool me], and “Piece of cake” [easy]). Learners more readily recognized literal meanings than idiomatic ones.

Roever (2005) designed 12 multiple-choice questions in a DCT-type format called a routines task which included a brief description of a situation followed by a question such as “What would Jack probably say?” The respondents then selected from among four choices: the target expression and three distracters (the distracters were either relevant but

nonidiomatic, or idiomatic but irrelevant). Learners in the host environment were better able to identify the pragmatic routines even after short exposure (three months) than learners without such exposure.

Like production tasks, interpretation and multiple-choice tasks draw on both pragmalinguistic and sociopragmatic knowledge. Thus, when learners reject a target-language conventional expression in a judgment task it is not possible to determine whether they do not know the expression or they find the expression to be inappropriate for the context. Decontextualized recognition tasks can help tease apart these situations.

Using a listening task Bardovi-Harlig (in press) presented learners with conventional expressions from the university community in which they lived and studied (e.g., “Be quiet” and “No problem”) and corresponding modified expressions (e.g., “Be silent” and “No problems”). Learners rated the expressions using three alternatives (I often/sometimes/never hear this). As learners increased in level of proficiency, their acceptance of modified expressions decreased whereas their acceptance of authentic expressions increased. Like native speakers, learners seem to be on their way to what Pawley and Syder (1983) call “nativelike selection,” the ability to identify conventional expressions from among a range of grammaticality correct paraphrases. The results suggest that learners may increasingly notice pragmatic input which could drive changes in production during the acquisition of L2 pragmatics.

Comparing learner familiarity with conventional expressions to their production reveals interesting patterns (Bardovi-Harlig, 2009). Some conventional expressions were recognized by all learners and were used at equally high rates; some were also not familiar and not used. Others gained in familiarity and production as learners became more proficient. The most interesting cases acquisitionally are the pragmatic routines that learners reported recognizing but did not use. Expressions such as “That’d be great” and “No problem” fall into this last category. Examination of the contexts in which native speakers use these expressions show that learners used alternative expressions in the first case (for example, thanking expressions) and expressions of accepting rather than deflecting thanks in the second (saying “You are welcome”). This emphasizes the fact that knowledge of the string of words that makes up a particular pragmatic routine is but one part of knowing of a pragmatic routine; knowing the contexts in which it occurs is equally important. The balance between expression and context, between pragmalinguistics and sociopragmatics, in the knowledge and use of pragmatic routines reflects the balance that exists in all areas of pragmatics.

Pragmatic Socialization

DUANDUAN LI

Introduction

Pragmatic socialization is defined by Blum-Kulka (1997) as “the ways in which children are socialized to use language in context in socially and culturally appropriate ways” (p. 3). A powerful contribution that *language socialization* research makes to an understanding of language development is its close attention to the linguistic forms that are used to socialize children and other novices into expected roles and behaviors in particular cultural contexts (Ochs, 1996). Kasper (2001) identified language socialization research as “eminently capable of” examining the acquisition or development of second language (L2) pragmatic competence, and not just L1 competence. Research done within the framework of pragmatic socialization reveals the acquisition of language and sociocultural competence as developmentally intertwined processes within daily routine activities in which children (or novices) learn to interpret, negotiate, and index meaning while (co-)constructing different types of social/cultural identities. It reflects a more sociocultural orientation than the cognitive/psychological orientation of earlier pragmatics studies.

Pragmatic Socialization in First Language (L1) Contexts

The majority of early pragmatic socialization research was carried out by L1 researchers who built upon the work of child developmental pragmatics in the late 1970s and early 1980s and extended the traditional microanalysis of interactions between children and their parents/caregivers by linking these processes to more general ethnographic accounts of cultural values, beliefs, and practices. The pragmatic behaviors of children, their peers, and caregivers were compared with interactional patterns within the wider community.

For instance, Samoan children’s speech act of clarification was tied to comparable routines in legal, school, and work settings in adult society (Ochs, 1988). Rhetorical questions by and to Kaluli (Papua New Guinea) children were compared with cultural preferences for indirect speech style or “turned over” language (Schieffelin, 1985). The speech act performance of teasing and assertions by white American working-class children was linked to the value of such language competence in the community (Miller, 1986). The structure of Kwara’ae (Soloman Islands) children’s disagreement and conflict resolution was, similarly, guided by norms governing these activities in Kwara’ae adults’ communication (Watson-Gegeo & Gegeo, 1986).

Pragmatic socialization processes may be either explicit or implicit. Explicit socialization is the process used when caregivers clearly teach social norms shared by members of society. In Ochs’s (1990) terms, this is “socialization to *use* language” (p. 291). Eliciting politeness routines (e.g., “Say ‘Thanks!’” or “What’s the magic word?”), offering conversational rules (e.g., “It’s your brother’s turn!”) or assertions regarding social norms (e.g., “Boys don’t cry!”) are all examples of how language is used explicitly as a medium of socialization. However, even though explicit socialization is the most salient to observe, “the greatest part of socio-cultural information is keyed implicitly,” a case of socialization

2 PRAGMATIC SOCIALIZATION

through the use of language (Ochs, 1990, p. 291). By observing and interacting with more expert members in language practices, novices develop an understanding of sociocultural phenomena and become competent members of a community. For example, Gleason, Perlman, & Greif (1984) found that young children learn how boys and girls (like men and women) are supposed to speak and behave by hearing gender-differentiated language at home or in other contexts.

Particular attention was given to the socializing role of *indexicals*, that is, linguistic resources that derive their meaning from conventional associations with the sociocultural dimensions of context. Ochs (1996) states that

a basic tenet of language socialization research is that *socialization is in part a process of assigning situational, i.e., indexical meanings* (e.g., temporal, spatial, social identity, social act, social activity, affective or epistemic meaning) to particular forms (e.g., interrogative forms, diminutive affixes, raised pitch and the like. (p. 411, italics in original)

Indexical knowledge is seen as “the core of linguistic and cultural competence and is the locus where language acquisition and socialization interface” (Ochs, 1996, p. 414).

One domain that has received considerable attention in pragmatic studies is the notion of politeness. According to Blum-Kulka (1997), “politeness is embedded in all aspects of human social interaction and as such is central to pragmatic socialization” (p. 142). Researchers in North America have described how middle-class mothers devote great efforts to socializing children into expected, polite behavior, such as the routines and expressions *please, excuse me, thank you*, and turn-taking rules, in various contexts, including “trick or treat” visits on Halloween, dinner table conversations, and other daily occurring interactions (Gleason et al., 1984).

Observations of children growing up in Japan also offer rich data about how children are shaped in particular, culturally appropriate ways through the language of their caregivers (e.g., Clancy, 1986; Cook, 2008). Clancy (1986) investigated how Japanese mothers teach their children to “read the minds” of other people so as to be sensitive to their needs because people may not express themselves directly. For example, children are taught to offer food again after a refusal, or to stop making requests of the visitor even if the requests are complied with willingly. In comparison to the dyadic participation structure which is often seen in schools in the United States, Cook (2008) investigated the specific multi-party interactional routines in Japanese elementary school classrooms in which students are required to provide initial reaction and comments to their classmates’ discourse. Cook proposes that such a participation structure helps socialize Japanese children to the culturally important skill of *attentive listening* and contributes to shaping children to be other-oriented, in a group-oriented society such as Japan.

Pragmatic Socialization in Bilingual and Multilingual Settings

The dramatic increase in the global communication among individuals of different cultural backgrounds in recent decades has directed researchers’ attention to the pragmatic socialization processes within sociolinguistically and culturally heterogeneous settings characterized by bilingualism and multilingualism (Duff, 2008). It is argued that people experience their primary pragmatic socialization during childhood, but that they also continue to experience pragmatic socialization throughout their lives as they enter new sociocultural contexts and take up new roles (Li, 2000; Duff, 2008). The language socialization paradigm, with its strong ethnographic orientation and its close attention to contextual dynamics of language behavior and human dilemmas and agency, has provided researchers of L2 pragmatics a rigorous approach that is very different from and complementary to

traditional L2 pragmatics research (also called “interlanguage pragmatics”). The contexts of research have been extended from originally family and native-language schools to second/heritage/foreign-language classrooms, immersion schools, overseas language study programs, job training programs, workplaces, and even cyberspace.

Blum-Kulka (1997) was a forerunner in adopting a pragmatic socialization approach in cross-cultural pragmatic research of dinner table conversations recorded in Jewish American, American Israeli, and Israeli families. During family dinner conversations, parents’ metapragmatic comments played a significant role in the process of language acquisition and the development of pragmatic skills, such as the choice of topics and language, rules of turn taking, modes of storytelling, and rules of politeness. There were marked cross-cultural differences which reflected specific styles of the three (ethnically related) cultural groups. For example, Jewish American mothers at the dinner table paid considerably more attention to following conversational norms and turn-taking than did mothers from Israel, which indicates that “Fair turn allocation and the censure of untimely interruptions seem to represent the discourse corollary of American ideals of individual rights and equal opportunity for all” (Blum-Kulka, 1997, p. 184).

De Geer, Tulviste, Mizera, & Tryggvason (2002), following Blum-Kulka (1997), conducted a large-scale cross-cultural study on mealtime conversation in 100 families, including Estonian, Finnish, Swedish, as well as Estonian and Finnish immigrant families living in Sweden. The results showed considerable variations in the content, the amount, and the way that metapragmatic comments were used by these closely related cultures, which illustrated “how much the peculiarities of language and culture affect verbal socialization” (De Geer et al., 2002, p. 1759).

Second/heritage/foreign-language classrooms can also operate as a socializing space. The nature of discourse in the classroom, despite its special characteristics, reflects broader and deeper cultural norms, values and beliefs of the target language (Falsgraf & Majors, 1995; DuFon, 1999; Ohta, 1999; He, 2000; Lo, 2004). For example, “attentive listening,” identified in L1 socialization context (Cook, 2008) was observed by Ohta (1999) with adult L2 learners of Japanese through modeling by the teacher, peripheral, and guided participation, direct instruction, and peer interaction. Falsgraf and Majors (1995) reported different directive styles and politeness features in Japanese and American teachers’ interaction with students. Teacher directives in Japanese (L2) immersion classes were found to be significantly more direct, which accentuate status differences between the teacher and students, whereas in English-medium classes teachers tended to minimize status markers in their speech to downplay the status differential between students and teacher. Poole (1992) also reported that teachers in post secondary English as a second language (ESL) classes try to avoid overt displays of asymmetry of power and downplay the status differential between the teacher and learners, reflecting the white middle-class American caregivers’ perspective of egalitarianism which is implicitly conveyed to these learners.

Pragmatic socialization related to particular cultural values and speech roles has also been documented by researchers examining heritage language (HL) classrooms. He’s (2000) research in weekend Chinese-American HL schools demonstrates that classroom discourse processes (e.g., teachers’ directives) socialized Chinese HL learners to values of respect for authority and group conformity in the Chinese culture. Similarly, Lo (2004) described a Korean HL teacher’s use of indexical “evidential marking” in her narratives as attempts to socialize Korean American children to a particular theory of affective display appropriate in Korean classrooms where affective restraint and suppression of private thoughts are seen as tokens of respect.

The study-abroad context has been investigated by researchers to explore the advantage of authentic sociocultural environments for L2 pragmatic socialization. DuFon (1999) investigated the pragmatic socialization of linguistic politeness for adult learners of Indonesian.

Ethnographic data focusing on address terms, greetings, and experience questions during the learners' interaction with native speakers illustrated both explicit socialization (e.g., metapragmatic instruction on how to *pamit*, or ask for permission, every time the learners wanted to leave their host family's house) and implicit socialization, through learners' participation in activities with members of the target community.

The workplace is attracting researchers' attention as a significant sociocultural context where novices, like immigrants, are socialized into new discourse systems and cultures. Li's (2000) ethnographic research examines the pragmatic socialization of Chinese immigrant women in an inner-city job training center and later their workplaces. Linking the microanalysis of their L2 requesting behavior to a more macroscopic understanding of the social structures, ideologies, and conventions, the study illustrates how these novices developed communicative competence by interacting with their peers and other more competent members in North American work places and society.

The worldwide use of computer technology has created a new contact zone in language learning and practice. Belz and Kinginger (2002) demonstrate how the "telecollaborative" language learning using global computer networks helps foreign-language learners develop pragmatic proficiency, specifically, sociolinguistic distinctions in pronouns of address (*tu* vs. *vous* in French and *du* vs. *Sie* in German, indexing status and formality). They believe that cyberspace can provide learners with easy access to communication with native speakers, enabling them to be socialized into more target-like pragmatic competence.

Issues Related to Pragmatic Socialization Research

Learner Agency/Subjectivity

While earlier pragmatic socialization researchers acknowledged the agency of novices, L1 research studies have generally viewed the child-caregiver (novice-expert) relationship as essentially unidirectional, from expert to novice. The extension of pragmatic socialization research to bilingual and multilingual contexts has helped researchers to reconceptualize pragmatic socialization: from seemingly more static social roles and identities to a more dynamic process—unpredictable, nonlinear, and affected by the agency, and multiple community memberships of participants (Ochs, 1996; Duff, 2008). The bidirectionality always implicit in the expert–novice relationship has been explored to a greater extent, to emphasize shifting expertise during interactions, and a recognition of learner subjectivity and agency, especially with adult learners who have had deep-rooted primary socialization in their first language(s) and culture(s).

However, research has also shown that not all language learners wish to behave pragmatically just like native speakers of the target language (e.g., Siegal, 1996; Li, 2000). Chinese immigrant women in Li's study sometimes resisted more "expert" peers' pragmatic socialization based on their personal values and cultural beliefs (e.g., when the native-speakers' peers' behavior was considered rude). They also counter-socialized the (rude) native speakers' pragmatic behavior in the workplace to render it more polite and collegial (Li, 2000). In Siegal (1996), the white female Japanese language learner constantly exercised agency during interactions with her male Japanese language instructor. The learner controlled the topic initiation and management, used status-incongruent linguistic choices in interaction, seemingly not because of her linguistic deficiency but due to a desire to position herself as a peer in the academic world. Some implications of these studies include a reconsideration and sensitivity toward issues of learner agency among second/foreign-language educators and socialization researchers. Learners can be informed of the various options offered by the pragmatic system of the target language without being coerced into making particular choices that they find incompatible with their values.

Criteria for Pragmatic (Language) Socialization Research

A language socialization perspective has been employed by more and more researchers in an attempt to bring sociocultural factors into the field of L2 pragmatics. However, the term *language socialization* is sometimes used too broadly as a “catch-all” term for any research that deals with language in relation to society or identity. Kulick and Schieffelin (2004) listed three criteria for standard language socialization studies: that they should be ethnographic in design, longitudinal in perspective, and deal with linguistic and cultural practices over time and across contexts. They make the strong claim that “any study of socialization that does not document the role of language in the acquisition of cultural practices is not only incomplete, it is fundamentally flawed” (p. 12). This presents practical problems when conducting pragmatic socialization research. As noted above, this research normally takes a longitudinal approach, documenting natural communicative processes over the course of developmental time and relates these processes to the larger sociocultural contexts. The conflict between the desire to observe and collect natural data and the impossibility of collecting truly natural data because of observers’ sometimes intrusive presence can be problematic. There are other serious methodological problems such as privacy issues, ethical issues, and the asymmetry of the researcher’s perceived power in relation to research participants.

Conclusion

Kasper (2001) suggests that

language socialization theory has a particularly rich potential for [second language acquisition] because it is inherently developmental and requires (rather than just allows) establishing links between culture, cognition, and language, between the macro-levels of socio-cultural and institutional contexts and the micro-level of discourse. (p. 311)

A pragmatic socialization approach can offer researchers opportunities to look at the *interactive* nature and the social *function* of pragmatic behavior that is deeply embedded within particular social and cultural *contexts*. By examining pragmatic behaviors in authentic contexts of use—with their own historical antecedents, interpersonal negotiations, and personal and societal significance, researchers can contextualize the study of pragmatics in a changing, multilingual world in illuminating new ways.

Pragmatic Transfer

PATRICIA BOU-FRANCH

As resourceful human beings, when we embark on a task for the first time, we resort, consciously or unconsciously, to our previous knowledge and experience in order to accomplish the task as efficiently as possible. This also applies to second (or third or other) language acquisition/learning scenarios: When we learn a new language, we already know, at least, a first language and have a wealth of world experience and information that will necessarily play a role in the acquisition and use of the new language. The interaction between the old information—our first language—and the new information—any subsequent language we may learn—is at the heart of the phenomenon of transfer. When we transfer pragmatic knowledge in learning or using a new language we talk of pragmatic transfer. The term “pragmatics” is used in this entry to refer to language use in specific situations and for specific purposes and this, in turn, involves the cognitive processes that make use of social and cultural information. A case of pragmatic transfer may involve, for example, employing certain linguistic forms to express a particular meaning due to the belief that this linguistic choice is socioculturally appropriate in the second language (L2) context because it would be appropriate in a context that the L2 user perceives as similar in his or her first language (L1).

During the 1940s and 1950s, researchers in bilingualism and second language acquisition (SLA) research noticed how phonological, syntactic, and lexical aspects of the L1 interfere with learning and using an L2. The foreign accents of L2 users make this interference particularly noticeable at the level of pronunciation. Within the framework of contrastive analysis in SLA research, Lado (1957) saw a connection between behaviorist views of language learning as habit formation and structural linguistics and suggested the contrastive analysis hypothesis, according to which, where two languages are different there will be negative transfer or L1 interference. Language distance and differences between languages are thought to lead to increased learning difficulty and the production of errors. In contrast, language similarity predicts positive transfer in the sense that learning will be facilitated and no errors will result. With these basic premises in mind, an individual's L1 is considered to play a crucial role in L2 acquisition, and teaching is directed at eliminating the negative, interfering habits of the L1.

However, empirical research soon exposed the untenability of this hypothesis: Errors occurred where they were not expected, and errors that were predicted did not materialize. In the 1970s, another area of research in SLA emerged, interlanguage pragmatics, whose premise is that learning proceeds on the basis of hypothesis formation and testing, and concerns itself with how L1 transfer and other acquisition processes interact as a learner's interlanguage moves toward the L2 norm. Work on learners' interlanguage led to a consideration of transfer as both a learning process and a strategy for language use (Selinker, 1972). Since then, the study of language transfer has developed and today it seems uncontested that the L1 is an influential factor in L2 acquisition and use (Kellerman & Sharwood-Smith, 1986).

However, it was not until Hymes's (1971) formulation of a socially situated communicative competence that SLA researchers became interested in pragmatics. Hymes's realization that L2 learners need not only linguistic information but also knowledge of social and

2 PRAGMATIC TRANSFER

cultural conventions if they are to communicate adequately in real-life situations brought about the gradual incorporation of a pragmatic component during the late 1970s and early 1980s into mainstream language transfer studies and influenced models of communicative competence for language teaching, thus drawing the attention of SLA scholars toward language use and pragmatics.

Two different perspectives on pragmatic transfer are described here. One is represented by the work of Kasper (1992) and draws from interlanguage studies, and the other by the work of Kecskes and Papp (2000), inspired by Cook's (1992) notion of multicompetence. Interlanguage pragmatics emerged as a branch of SLA research that studies learners' awareness and comprehension of speech acts as well as the development of L2 pragmatic competence (Kasper, 1992; Kasper & Rose, 2002). It brings the study of pragmatic transfer to the forefront of SLA research in order to explain learners' divergence/convergence with a native pragmatic norm which is seen as the ideal target for learners. In her work on pragmatic transfer, Kasper (1992, p. 207) defines this notion as "the influence exerted by learners' pragmatic knowledge of languages and cultures other than L2 on the comprehension, production and learning of L2 pragmatic information." Particularly useful and widely used is Kasper's (1992) reformulation of two types of pragmatic transfer (Thomas, 1983). On the one hand, *pragmalinguistic transfer* refers to those cases in which the functional and social meanings of certain linguistic forms in the L1 affect the comprehension and production of "form-function mappings in L2" (Kasper, 1992, p. 209). On the other hand, *sociopragmatic transfer* occurs when "the social perceptions underlying language users' interpretation and performance of linguistic action in L2 are influenced by their assessment of subjectively equivalent L1 contexts" (Kasper, 1992, p. 209).

Researchers in the field of interlanguage pragmatics have provided evidence of the existence of a largely universal pragmatic base at both the *pragmalinguistic* and *sociopragmatic* levels available to learners in using an L2; this means that learners can access information regarding different linguistic forms and sociocultural aspects in order to perform particular functions. However, learners do not always use this knowledge, even though it is universal and therefore freely available to them. As a result, the teaching of pragmatics specially directed at making learners aware of what they already know and of encouraging transfer of these universals is considered to play a crucial role in the acquisition of pragmatic competence. Learners' L2 performance that is different from native-like communicative behavior is seen in terms of communicative or pragmatic failure, a situation that may have important consequences for the learners' self-presentation in the sense that the failure to communicate as expected in the target language, especially among L2 users of a higher level of proficiency, may be attributed to a personal intention to cause offense or hurt others' feelings instead of to a lack of pragmatic knowledge (Thomas, 1983; Kasper, 1992).

Today a large body of research on interlanguage pragmatics focuses on pragmatic transfer in relation to the development and use of L2 pragmatic ability, the teaching of L2 pragmatics, and pragmatics in the classroom context (Kasper & Rose, 2002; Barron, 2007; Matsumura, 2007).

Drawing on the idea that much SLA research exhibits a monolingual bias as it assumes a native speaker's competence to be the (largely unachievable) target that learners should aim at, Cook (1992) claims that the L2 user must be recognized as an independent individual with multicompetence—two or more languages in one mind—who is unique and distinct from a monocompetent native speaker. From the point of view of the multicompetence framework, the L2 user is not characterized as a deficient monolingual speaker, nor is learning seen in terms of lack of success or failure for not achieving full L2 competence. Since most human beings know two or more languages, Cook (1992) underlines the interaction of all languages known to an L2 user and draws special attention to the

influence of the L2 on the L1. Cook further views transfer as part of multicompetence in diachronic and synchronic terms; transfer plays a role both during the course of acquisition and as part of an L2 user's state of knowledge at a given time. Cook's model has been applied and further developed in various ways. Of special relevance to this overview is the work of Kecskes and Papp (2000) on pragmatic transfer from a multicompetence perspective.

These authors adopt a cognitive-pragmatic perspective and argue that multilingual individuals have two or more language systems which are in constant interaction as well as a common underlying conceptual base; it is thanks to the latter that multicompetent speakers can transfer concepts, pragmatic knowledge, and skills obtained through one language to the other language channel.

Currently, pragmatic transfer is considered to be bidirectional, that is, from the L1 to the L2 and vice-versa, and the L1 is further seen as influencing avoidance or overuse of certain aspects of language use (Kellerman & Sharwood-Smith, 1986; Kecskes & Papp, 2000).

One of the main objectives of research into pragmatic transfer is to discover the factors that promote or inhibit its occurrence. A certain degree of L2 proficiency or established multicompetence has been found to be a general condition for pragmatic transfer to take place. Takahashi and Beebe (1987) proposed the "positive correlation hypothesis," by which more proficient learners are seen as more likely to transfer L1 sociocultural norms than less proficient users because the former's greater linguistic knowledge allows them to do so. However, this hypothesis was not supported by further empirical research and the influence of proficiency on pragmatic transfer remains a controversial issue (Robinson, 1992; Maeshiba, Yoshimaga, Kasper, & Ross, 1996; Wannaruk, 2008). In fact, some empirical research demonstrates that learners of all proficiency levels rely on their L1, albeit to different degrees, and underlines the complex relationship between proficiency, transfer, and other acquisition processes (Sabaté i Dalmau & Curell i Gotor, 2007). The contradicting evidence in this area suggests that it needs to be addressed further (Chang, 2009).

Other factors that affect the process of pragmatic transfer include perceived linguistic and cultural distance and the willingness and motivation of the learner to assume L2 sociocultural values and thus make them functional in the L2 users' underlying conceptual base (Kellerman & Sharwood-Smith, 1986; Kecskes & Papp, 2000). This means that L2 users may choose not to accommodate to the new sociocultural context. Perceptions of status differences and adherence to cultural values like modesty are a case in point (Beebe, Takahashi, & Uliss-Weltz, 1990; Matsumura, 2007; Wannaruk, 2008). In this respect, researchers claim that learners need not completely assimilate to the new language/culture; however, they must be aware of the effects that their pragmatic choices may have on intercultural communication (Thomas, 1983; Wannaruk, 2008; Chang, 2009).

Finally, length of stay in the L2 community and exposure to the target language constitute factors that may favor positive transfer and L2-like pragmatic behavior. Recent research into acquisition during and after study-abroad programs has confirmed this move toward less negative pragmatic transfer (Barron, 2007; Matsumura, 2007). Additionally, research shows that pragmatic competence continues to develop one year after learners' return from their stay abroad and that L2 users have more pragmatic options at their disposal and may choose to transfer their sociocultural norms in particular situations (Matsumura, 2007). This could be treated as evidence of the intercultural style that proficient, multicompetent L2 users attain and that is claimed to be distinct from the native styles of both the L1 and the L2 (Kecskes & Papp, 2000).

Future research in pragmatic transfer should examine more varied data (conversational, written, and computer-mediated), and broaden the focus of inquiry beyond the limits of the turn and traditional speech-act theory. Recent work that employs conversation-analytic

4 PRAGMATIC TRANSFER

methods to examine pragmatic transfer and takes into account the sequential and collaborative nature of conversation represents a step in this direction (Taleghani-Nikazm & Huth, 2010).

Another area that is receiving increasing attention is pragmatic transfer in the context of multilingualism. Here the study of transfer is highly complex due to the additional languages it entails. Proficiency level not only affects pragmatic transfer but is instrumental in determining what language to transfer from. Other factors influencing transfer in L3 acquisition include age, closeness between all the languages known to the individual, and “recency” or resorting to the language more often and more actively used by the multilingual individual (Cenoz, 2001).

Communication today is becoming increasingly intercultural and often takes place between individuals of different languages and cultures using a common L2. This global, intercultural setting makes the study of pragmatic transfer in the development and use of new languages even more stimulating and necessary.

Pragmatics and Cognition

VICTORIA ESCANDELL-VIDAL

When in the mid-1980s pragmatics (roughly, the study of the use of language in human communication) met cognitive science (the study of human mental abilities and processes, particularly those related to the management of information), a new and fruitful field was created, dealing with the mental skills and subsystems underlying our ability to communicate. Cognitive science was born as an interdisciplinary research area, at the crossroads of psychology, neuroscience, artificial intelligence, anthropology, linguistics, and philosophy. The idea that the architecture, skills, and processing devices of the human mind/brain determine our behavior was so appealing to pragmatists that a program of research based on the insights of cognitive science was soon established to bring a new light on a variety of pragmatic phenomena. Since then, few areas have undergone such significant changes. In fact, the various aspects of cognition that successively entered the pragmatic scene contributed to definitively shaping the development and the future of the whole field.

The Antecedents: Rationality Principles and Intentionality in Philosophical Pragmatics

At the very heart of the pragmatic endeavor lies the need to explain how human communication works. As is well known, the origins of modern pragmatics are deeply rooted in the philosophy of language. Philosophical approaches noted that there can be a significant gap between the meaning encoded in a linguistic form and the interpretation intended by the speaker, but nevertheless, addressees are usually able to fill this gap in a (seemingly) effortless way. This suggests that, beyond the rules of grammar, there must be some sort of systematic principles that govern linguistic interaction. Austin (1962), Searle (1969), and Grice (1975) emphasized the fact that language acquires new dimensions when it is used in interaction.

Austin noticed that utterances do not merely describe existing states of affairs, but also perform various kinds of actions, such as to request, apologize, and promise; these will be felicitous only if certain conditions are met, so specifying those general conditions is a way to contribute to a general understanding of how human communication works.

Searle put emphasis on the conventional side of communication and tried to define the rules that must be followed for the successful performance of different speech acts; among these rules he included sincerity conditions, that is, specific requirements on the mental states that the speaker is assumed to adopt when performing each kind of speech act. This brings to the foreground the idea that some cognitive processes play a role in utterance interpretation.

Grice, in turn, focused on the nonconventional side of meaning. The meaning of linguistic expressions is highly sensitive to both the speaker's intentions and the context, so the addressee's task in assigning an interpretation to an utterance includes identifying such intentions and computing the effects of the nonlinguistic factors that surround the linguistic exchange. The extra meaning obtained (i.e., the assumptions that fill the gap between the encoded meaning and the interpretation arrived at by the addressee) is what Grice terms

an *implicature*. As an explanation of this, Grice suggested the cooperative principle, which reads: “Make your contribution such as it is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged” (Grice, 1975, p. 45). Speakers are supposed to tacitly conform with this when producing their utterances and hearers can assume that speakers are being cooperative when interpreting them. This principle is, in some sense, a generalization about how the human mind is expected to work when engaging in a joint activity, be it linguistic or not.

A similar picture can be obtained when looking at so-called neo-Gricean approaches. The proposals in Horn (1984, 2004) and Levinson (2000) depart from Grice’s in many respects (particularly in the fact that they focus on the linguistic side of utterances, rather than on the particularized, once-off interpretation based on intention and context). Nevertheless, both authors further explore the idea that some general principles must govern linguistic communication. These principles are heuristic reasoning patterns based on standards of quantity, informativeness, and manner (stemming from the Gricean maxims), internal to each individual and common to all the members of our species.

All these approaches, though very different from each other in many respects, had nevertheless a similar aim. The search for underlying principles invoked certain principles of rationality (particularly in the work by Grice, Horn, and Levinson), thus directing the explanation toward universal laws and cognitive properties of the human mind. In addition, the connection between utterance meaning and intention—a key notion in some of these founding insights—was opening the door to explaining linguistic behavior in terms of the mental states of the participants, thus assigning a crucial role to the ability to attribute and recognize mental states in others. Thus, to a greater or lesser extent, these philosophical accounts tried to discover how human cognition determines linguistic behavior. They cannot be called *cognitive* in the sense we currently tend to attribute to this word, but they were in some way anticipating a line of research that would dominate the later scene in pragmatics.

The Foundations of Cognitive Pragmatics: Relevance Theory

Whereas the previous approaches can be seen as implicitly touching on cognition, relevance theory (Sperber & Wilson, 1986/1995) was the first model of human communication to overtly embrace the cognitive program. From a relevance-theoretic perspective, pragmatics is “the study of the general cognitive principles and abilities involved in utterance interpretation, and of their cognitive effects” (Wilson & Sperber, 1990, p. 35). Mental capacities, processing devices, and representations are thus basic notions in this model.

The cognitive approach advocated by relevance theory implies broadening the domain of pragmatics in two directions. First, pragmatics is not merely a discipline, but rather a processing system specialized in the interpretation of intentional communication. As Carston (2002, pp. 128–9) puts it: “‘pragmatics’ is a capacity of the mind, a kind of information-processing system, a system for interpreting a particular phenomenon in the world, namely human communicative behavior.” A favorite topic of relevance theorists is precisely the discussion on the status of the pragmatic system—whether it is an autonomous, dedicated module or not (see Sperber & Wilson, 2002)—and the way in which it interacts with the rest of the cognitive subsystems, such as the language faculty and the theory-of-mind module, among others.

Second, it is not the use of linguistic means, but intentionality, that defines human communication. This move implies a new view on the role of linguistic encoding—human communication is no longer seen as a matter of encoding and decoding messages, with pragmatics as a subsidiary processing device accounting for the gap between encoded meaning and the addressee’s interpretation; rather, human communication is primarily a

matter of inferring the communicator's intentions on the basis of the evidence provided by the communicator. The pragmatic system is a dedicated inferential device working for any sort of intentional communication, whether linguistic or nonlinguistic. The construction and evaluation of hypotheses about the communicator's intentions involves a very specific ability, namely, that of attributing mental states (which can be radically different from one's own) to other individuals: "Pragmatic interpretation is ultimately an exercise in mindreading, involving the inferential attribution of intentions" (Sperber & Wilson, 2002, p. 3). Of course, utterances are a privileged way of communicating, but they are used primarily as providing evidence of what the speaker wants to communicate rather than directly encoding the message.

If verbal communication is just a particular, though central, case of a more general process, it is then no surprise that the principles governing utterance interpretation should be of a general nature as well. Relevance theory stands on two principles. The first one, called the cognitive principle, is a generalization on the way human cognition works: "Human cognition tends to be geared to the maximisation of relevance" (Sperber & Wilson, 1986/1995, p. 260). This principle states that cognitive resources, which are limited, are preferably allocated to processing the most relevant input available. This is the result of an evolutionary transformation toward cognitive efficiency. The second principle, called the communicative principle, reads: "Every act of ostensive communication communicates a presumption of its own optimal relevance" (Sperber & Wilson, 1986/1995, p. 260). Though the particular details of the interpretation of this principle are far too complex to be discussed here, it should suffice to say that it does not establish that it would be sensible, or desirable, for a communicator to be relevant; rather, it states that an expectation of optimal relevance is created in the addressee's mind that guides him or her through a specific path of interpretation—that of taking relevance for granted and examining hypotheses about the communicator's intentions in order of accessibility until the expectations of relevance are fulfilled. Thus the functional architecture of the human mind and the participants' mental states (intentions, desires, and beliefs) are given a central role in the organization of the theory.

The cognitive perspective has also produced substantial changes in the way pragmatic explanation is pursued. Relevance theory is the first model to advocate for an approach to pragmatics rooted in the findings of empirical sciences. The way was opened to a multidisciplinary research program, where the contributions by psychologists, evolutionary anthropologists, and neuroscientists became central references in the literature on pragmatics (Leslie, 1994).

Relevance theory is also the first model that has committed itself to experimental testing. Experimental pragmatics has experienced remarkable growth thanks to relevance-theoretic proposals (Noveck & Reboul, 2008). The predictions of the theory and its explanatory power have given rise to a wealth of experimental research, providing insightful solutions to various problems (Noveck & Sperber, 2004).

Possibly one of the most interesting discussions that relevance theory introduced in the pragmatic arena has to do with the level of explanation. Elaborating on Dennett's (1969) distinction between the personal and the subpersonal level, relevance theorists have argued for a model aiming at subpersonal explanations. An explanation at the personal level involves considering people as rational agents with rational intentions and accounting for their behavior in terms of what would be reasonable to assume they would do. However, when the explanation moves to the subpersonal level, causation is accounted for in mechanical terms, that is, in terms of the brain and the events occurring in the nervous system. Utterance interpretation (including the attribution of certain mental states to the speaker) is not a long, rational, and conscious process; rather, it takes place below the level of consciousness. Only in this way can we explain why the pragmatic system "is fast and

automatic, and, more crucial to the position, it is domain-specific, in that it is activated exclusively by ostensive stimuli and employs its own proprietary concepts and processing strategies and routines" (Carston, 2002, p. 132). Moving to the subpersonal level is a way to avoid the problems of accounting for agency by invoking individual sensations and activities, so as to obtain a more general level of explanation for mental processes.

Social Cognition

If this entry had been written some 15 years ago, it would have finished at this point. Relevance theory was the only research program to overtly adopt a cognitive perspective and represented a new orientation with respect to the two prevailing ways of doing pragmatics, the philosophical and the social approach.

In fact, at that time, a considerable wealth of pragmatic research was devoted to studying aspects of communication from a sociological perspective. Following the idea that communication involves social conventions and routines, social pragmatics put the emphasis on the external factors (situation, power relationships among the participants, etc.) that determine linguistic use (Brown & Levinson, 1978). Research was conducted with statistical tools on a significant sample of data, so as to obtain general trends in linguistic behavior. Interlinguistic and cross-cultural differences were soon found and the role of culture in shaping conversational styles became a favorite topic of research.

The situation has radically changed in recent years with the birth of the field of research that we currently know as social cognition. Social cognition encompasses "any cognitive process that involves conspecifics, either at a group level or on a one-to-one basis" (Blakemore, Winston, & Frith, 2004, p. 216). More specifically, it involves "the individual's cognitive relationship to the social corpora (family, friends, institutions, etc.) and the ambient postulates that inform a culture, its technology and the complex manifold of artefactual and environmental considerations that are transpersonal" (Marsh & Onof, 2008, p. 1).

Thus, social cognition is a new area of inquiry shared by many disciplines. Sociologists place emphasis on the problem of how and to what extent the social setting determines an individual's cognitive state; psychologists attempt to discover what processes take place in the mind as the basis of social cognition; for linguists, the fundamental question is how the mechanisms governing social cognition and language use interact with each other. By considering the cognitive capacities underlying social actions, pragmatic studies recuperate the abstract, general dimension somewhat overlooked by previous sociologically oriented approaches. This is decisive for constructing an explanatory theoretical model of human interaction (Escandell-Vidal, 2004).

Social cognition is not just the name of a discipline, but also of a specialized cognitive subsystem, responsible for the processing of information related to other human beings, including the ability to perceive, interpret, and explain their behavior. From a cognitive perspective, the human mind can be described as a network of processing mechanisms, each with a proprietary domain and autonomous principles. In this sense, the connections between the social capacity and the inferential system envisaged by relevance theorists soon became clear and paved the way for an approach to social aspects of communication from within relevance theory (Jucker, 1988; Escandell-Vidal, 1996; Sperber & Wilson, 1997).

Several research lines can be identified in studies on social cognition. The first one is represented by the neuroanatomical approach, which gives priority to investigating the location in the brain of the capacities on which actions in the social setting are based and the mental capacities that are prerequisites for full social interaction (Escandell-Vidal, 2009). Empirical research has identified the brain areas responsible for social behavior by discovering meaningful correlations between certain kinds of brain damages and deficits in social interaction (Adolphs, 2003, 2006). The emergence of a specific cognitive subsystem

for managing social interaction (*cultural intelligence*) is an evolutionary adaptation to deal with very complex interpersonal relationships. The existence of a neural basis for social cognition opens a new explanatory dimension for pragmatic research at the subpersonal level.

The second main line of research in social cognition moves into the domain of anthropological and cultural studies. The members of any social group show common trends in their social behavior. This is usually seen as the result of sharing a set of representations, which we call *culture*. Socially acquired behavior tends to stabilize not only in the form of recurrent interaction patterns that are perceived as cultural norms, but also as structures of knowledge (scripts or schemata; Schank & Abelson, 1977) and as part of word meaning (Kecskes, 2004), generating precise expectations about social and verbal behavior. A major concern for social inquiry is to understand how each particular set is formed, stabilized, and distributed among the members of a social group. Several approaches have been suggested (Tomasello, 1999; Sperber & Hirschfeld, 2004), some of them with close relations with relevance theory (Sperber & Wilson, 1986/1995).

Social cognition has triggered a revision of some basic notions. Among them, an area of particular interest is that of the boundaries between the individual and the social. The status of intention in pragmatic theory can represent a case in point. Intention was initially seen as a private mental experience, at the root of goal-directed activity; later, intention was considered as an epiphenomenon of subpersonal brain activity, frequently out of the reach of an individual's consciousness; finally, in recent years, intention has been considered as an "emergent product of social interactions" (Gibbs, 2001), in a more dynamic and interactive view of human behavior. If human communication is, after all, a form of joint activity, shared intentions must play a role—individual intentions are reshaped and negotiated through the interaction and so collective behavior is not the simple sum of individual intentions.

A similar line of thinking is present in the approach known as *distributed cognition*, an approach based on the idea that not all cognitive events have to be "encompassed by the skin or skull of an individual" (Hutchins 2000, p. 1). Many aspects of social organization crucially depend on skills and expertise distributed among various members of the group. In a similar way, the knowledge of the norms of a given culture is not necessarily a property of each and every member of a community—only the group as a whole has the full version of that knowledge. Thus groups happen to have properties of their own that can be different from the properties of individual members. If human cognition is unique it is precisely because it is a cultural phenomenon.

The advent of social cognition has thus blurred and dissolved the previously prevailing dichotomies between social and cognitive pragmatics, between the individual and the social. Nowadays, most research on pragmatic aspects calls itself sociocognitive, thus showing the need to consider both sides of human communication from an integrated perspective (Kecskes & Horn, 2007; van Dijk, 2008; Kecskes, 2010).

Pragmatics and Culture

THORSTEN HUTH

While phonology (sound system), morphology and lexis (word formation and the inventory of words), syntax (sentence formation), and semantics (meaning) describe the discrete combinatorial system underlying language, pragmatics situates that very system in social context. The following is concerned with how pragmatics provides insight into culture, defined here as the shared conventions of speaking and interaction in a given language community.

At its most general, pragmatics highlights the social context in which members of a given community put language to use for specific communicative ends. For example, what may prompt the use of a subjunctive to make a request polite? How and with what linguistic resources do speakers order a coffee at a restaurant? Under what circumstances may speakers issue an invitation to a friend or perhaps a work colleague? In what linguistic form may one relevantly extend compliments and to whom? And in what form does one apologize effectively for a potential impropriety? Such questions aim at identifying the merging of particular social and cultural contexts with particular linguistic resources. Speakers are bound to coordinate both relevantly in their communication efforts if they are to be effective.

It is widely agreed that language and culture share a reflexive relationship. This interest has increasingly been channeled into the field of pragmatics. By now, a growing body of research is devoted to illuminating what speakers “do” with words, what actions they achieve through language use, and how those achievements reflect the culture of speaking in a language community. This interest may not be surprising given the increasing ease, range, and speed of travel worldwide, and the tangible impact of the Internet for communication on a global scale. However, while human contact and communication across linguistic and cultural lines has increased in quantity through the opportunities afforded by new technologies, mutual understanding across these fault lines is by no means guaranteed.

In fact, communication across language communities and cultures remains as challenging as ever, even if those involved in interaction speak each other’s language well in terms of “grammar.” The recreational traveler abroad, business people engaged in multinational contract negotiations, or politicians striving to resolve international matters across linguistic boundaries all face the same task: pursuing their personal or professional goals through communication. However, communication requires not only the production of a discrete combinatorial system of sounds (which form words, which form sentences, which have meaning), but also requires the relevant knowledge and actual ability to put this very system to effective use. “Effective” in the context of pragmatics would be defined as consistent with the cultural conventions of speaking in a given language community.

Pragmatics as a cultural system of linguistic practices is deeply rooted in first language acquisition. Pragmatics emerges in children as a result of language socialization (Schieffelin & Ochs, 1986). Children develop an awareness of social (hence cultural) context for certain (language) behaviors even before first words are uttered. It means for them to become aware that speakers may normatively orient to certain patterns of (language) behavior; it means to identify social contexts and situations in which such patterns may occur; and

finally, as language eventually emerges, it means to put particular linguistic and extra-linguistic resources to effective communicative use in the specific contexts and situations previously identified.

This is significant to the systematic study of pragmatics as a window to culture on several counts. First, since learning pragmatics is the result of a socialization process, the basic assumption that both concepts are indeed connected is validated. If a particular culture of speaking has to be learned through observation and participation, it can be firmly concluded that pragmatics provides a matrix in which particular aspects of language and culture relevantly meet. Second, as a result of socialization from early childhood on, pragmatics is in large part a matter of implicit, tacit, or unconscious knowledge. Adults are in fact rarely aware of their own pragmatics, or only so in parts. Golato (2003) provides an instructive study on what German speakers know about their own pragmatics and measures this against their real-life pragmatic behavior. Speakers were first audio-recorded in real life and subsequently provided with questionnaires in which the exact situations that were found on the tapes were replicated in written format. Interestingly, the recordings and what participants reported in the questionnaires turned out to be quite different because informants were in fact *doing* different things pragmatically in real life compared to what they *report* they are doing pragmatically if asked.

For language learners, this has tangible consequences in terms of learning to communicate effectively as well as making sense of different pragmatics across cultures. Since pragmatics are so deeply ingrained in speakers' interactional behavior, they are regularly transferred by speakers from their native language when they are using the second language for their social and interactional needs. In other words, while speaking a second language, a language learner will predictably put the newly learned words and structures to use in terms of the pragmatics of his or her native language. Empirical research has amply documented such pragmatic transfer, and it regularly leads to miscommunication across linguistic and cultural lines (Kasper, 1992). This is why culture shock remains a predictable phenomenon for expatriates or travelers, since it is in part mediated by different pragmatic conventions in different language communities. Thus we note that, while there is culture in pragmatics, this set of cultural practices underlying a second language is not an automatic by-product of words and grammar. On the contrary, the pragmatics of a non-primary language have to be learned separately—through observation, participation, or classroom instruction (Rose, 2005).

Furthermore, if learners are indeed aware of pragmatics, this awareness can shape how they view their own language community or others. To reiterate, the common perception of pragmatics is often inaccurate, be it self-perception by native speakers or other-perception by foreign language learners. At the same time, personal opinions and beliefs concerning pragmatics loom large and provide ample opportunity for controversial debate. Common cultural clichés and stereotypes are often the result of how different pragmatics are perceived across cultural lines (e.g., culture X is rude, culture Y is welcoming, culture Z is shallow). Such cultural imaginations and myths may then perpetuate themselves as they are imposed on a particular language community from the outside. They may also develop from within since native speakers may build their self-image based on their own perceived language behavior. As already mentioned, the mere perception of pragmatics is not infallible and may not necessarily reflect what actually happens.

The notion of pragmatic variation and its cultural implications complicates matters further. Pragmatic variation may exist along particular demographic, hence culturally significant, lines such as age, status, gender, power differential, etc. (Gumperz, 1983). As speakers negotiate their own cultural identity through pragmatics, individual choice affords them the opportunity to position themselves socially according to their own preferences. For example, while a majority of Germans may well shake hands in certain situations (body

language), so might Hans, but Gabi might not. Just as the lexicon or the grammar of a language may change over time as it is continuously molded by its speakers, pragmatics is also an arena in which speakers may affect the rules of the game as they are playing it. Pragmatists face the dilemma of potential and often consequential variation in the very cultural construct they strive to describe systematically. Hence, describing pragmatic conventions in terms of monolithic or prescriptive rules is problematic. If potential for pragmatic (hence cultural) variation is ignored, pragmatics can be a notorious arena for promoting cultural essentialism. “All speakers of language X *always* do Y in social situation Z” would be a finding that is likely not to hold up in light of variational concerns. Hence, caution is required on the one hand for how to study pragmatics, and on the other hand for connecting the results of pragmatic research to whatever notion of culture one may operationalize in a given academic context.

And indeed, many such definitions exist. Pragmatics and culture as special terms are in the purview of various epistemological and methodological perspectives. The array of academic disciplines concerned with human communication and its relation to cultural context is wide: philosophy, linguistics, sociology, anthropology, or language acquisition (first, second, or other) are only some prominent areas interested in both. Major frameworks connecting pragmatics and culture include politeness theory (Brown & Levinson, 1987) or the notion of “face” across cultures (Scollon & Scollon, 2001), maxims of cooperation and politeness (Grice, 1975), communication as a culture of social interaction (Habermas, 2001), or sociocultural theory in the context of language learning (Lantolf, 2000). Further theories of culture across disciplines include culture as socially distributed knowledge, communication, or as related systems of mediation, practices, and participation (Duranti, 1997).

Irrespective of the specific notion of pragmatics or culture one may utilize, connecting both in a viable manner requires that scholars offer a solid cultural analysis linked to a thorough linguistic/pragmatic analysis. Since different research areas have different stakes, goals, and methods for studying how language and cultural context may interconnect, each strives to illuminate their respective focus of inquiry within particular conceptual frameworks. Not all approaches to pragmatics or to culture relate to one another, not all are commensurable, and some follow agendas that can be communicated across disciplinary lines only with difficulty. Let us illustrate this with two prominent examples.

Speech act theory in the tradition of Austin (1962) and Searle (1969) has been a widely applied framework for studying pragmatics. Emerging from philosophy, the linguistic unit studied in this line of research is what is considered a well-formed and fully grammatical sentence, considered here as an “utterance.” In turn, the relation of a given grammatical sentence to particular social contexts (i.e., its pragmatics) is approached as a tripartite endeavor: the study of its locutionary, illocutionary, and perlocutionary force. The first describes the act of making an utterance in the first place, the second describes that which is being achieved by the act of uttering, and the last describes the actual effect or the consequences of the previous two. A central concern in this framework is measuring the possible intentions of a given utterance against its possible effects. Thus, the pragmatic force of a possible, grammatical sentence is triangulated, and different kinds of meanings may emerge according to its overall purpose and function. For example, the utterance “There is a draft in this room” may, depending on context, be considered to be an observation in response to the task of finding an explanation to the vexing question why the candle on the table is presently flickering. In a different context, it may also well mean that the speaker who utters it is making an implicit request or command to some other copresent person, prompting the closing of an open vent, window, or door.

Speech act theory thus focuses on the linguistic unit “sentence” by asking what possible meanings a sentence as utterance may harbor, particularly insofar as that which is achieved by an utterance, the “speech act” itself, is concerned. Such possible actions include what

can often be well described with performative verbs such as observing, explaining, commanding, requesting, apologizing, inviting, reprimanding, and countless others. The notion of culture emerging from this understanding of pragmatics rests on a consideration of the possible meanings of particular utterances according to social context, intentionality, and effect of the utterance. Since these may be culturally specific, cultural significance would lie in the possible meanings of—that is, the possible actions achieved by—a given grammatical sentence across language communities. In other words, we ask what a given sentence can mean in language community X, and how that range of possible cultural meaning may differ in language community Y.

In contrast, consider a strand of research emerging from sociology. Conversation analysis (CA) was spearheaded by Sacks, Schegloff, and Jefferson in the late 1960s and focuses on how speakers manage to produce orderly, interpretable conduct in real-life interaction (Atkinson & Heritage, 1984; Schegloff, 2007). Based on video and audio recordings of actual talk, CA investigates what kind of mechanisms allow speakers to anticipate, interpret, and produce a relevant “next” action in the back and forth of turns at talk. A major discovery of CA research is that turns are not taken at random, but that they are organized in a highly orderly fashion. Certain combinations of turns are typed, forming pairs that generally occur together (question–answer, compliment–response, greeting–greeting). Some first parts of pairs project a range of possible second parts, forming orderly sequences. Some second pair parts are preferred over others: for instance, a preferred response to an assertion is typically agreement, a preferred second part to an invitation is typically an acceptance, not a rejection, and the preferred second pair part to an offer is typically an acceptance. Hence, social context and, by extension, cultural specificity, is not primarily situated in the circumstances surrounding the properties of the speakers involved such as age, social status, power relations, gender, socioeconomic status, etc. Rather, social context is located in the unfolding and management of turns and sequences of turns themselves, subsumed with the notions of paired action and preference structure. Both have been shown to be both culturally variant and universal (Moerman, 1988).

As we compare speech act theory and CA as distinct research paradigms illuminating different aspects of pragmatics (Streeck, 1980), we see sharp differences: different kinds of data (elicited or invented examples vs. examples from actual recordings), different units of analysis (one utterance vs. turns and sequences of turns), different goals (studying possible intentions and effects vs. studying speakers’ orientation in sequential context), and different conceptual tools (locution, illocution, perlocution vs. turns, pairs, preference structure). Such different conceptualizations of pragmatics thus shape the respective understanding of culture and how we describe it. For an applied linguist, this means to be specific in delineating quite clearly what kind of linguistic analysis is meant to shed light on which notion of pragmatics or culture. After all, the available units of analysis range from lexical semantics to discourse particles, from the managing of silence between speakers to speech acts, from vocabulary register to gestures and other aspects of body language, from intonation and prosody to turns and sequences of talk. Irrespective of the particular focus of a study, in each instance the respective units of analysis provide a different kind of access to any given notion of culture.

If pragmatic variation is indeed viewed as reflecting cultural difference, then the question remains how one might make sense of the observed variation. Unfortunately, it is tremendously difficult to “explain” pragmatic phenomena in light of other cultural concepts, be it in correlational or causative terms. This endeavor is prone to cultural evaluation and bias. For example, one intriguing empirical finding on one aspect of German pragmatics is that Germans apparently do not frequently say *Danke* as a compliment response, while in American English, *thank you* is a frequent compliment response (Golato, 2005). For American students of German, learning about and making sense of this cross-cultural

difference can result in the conclusion and concurrent judgment that Germans must not be a particularly appreciative people (Huth, 2006). By evaluating the observed difference from within the L1 cultural vantage point, the following and rather precarious line of reasoning is all too easily established: "all speakers of language community X always do Y in situation Z *because that's what their culture is all about.*" As we can see, it is a long way from establishing empirically what speakers do pragmatically in particular sociocultural contexts to coming to an informed understanding of the possible cultural implications of such findings.

Hence, making sense of pragmatic variation across cultures often leads into precarious territory as we observe pragmatic phenomena in real life and, sometimes without inherent relevance, proceed to connect such perceived language behaviors to larger cultural issues such as the mentality or the particular worldview of the culture in question. Curiously, making sense of intercultural differences as reflected in pragmatics is often done on the implicit assumption that *all* culturally grounded domains of a language community (from food to housing to worldviews to linguistic behavior) constitute coherent, systematic, and neatly interlocking constructs bereft of possible contradictions or inconsistencies. In such a view, the sum of the cultural experience in a language community must be *fully* explainable and tightly interdependent. However, cultures viewed as language communities are by no means monolithic. They are heterogeneous, organic constructs that defy such simplistic explanation by correlation, causation, or a confusion of both. Hence, it cannot be emphasized enough that the "why" behind observable pragmatic patterns is a notoriously contentious issue; we simply often do not know in terms of cause and effect why culture A may do X pragmatically in particular contexts whereas culture B may rather do Y or Z in similar contexts.

To conclude, since pragmatics is largely a matter of often inaccurate perception, empirical study is required. Viewed as cultural practice, pragmatics provides an instructive window into the culture of speaking of a language community and can illuminate how miscommunication across linguistic and cultural boundaries occurs, often in astonishing detail. However, extrapolating from pragmatics to various notions of culture is a path leading through many a conceptual quicksand. Both concepts are wide in scope, and, for both, scholars continue to strive for a viable metalanguage in the pursuit of adequate description. It is to be expected that in a world with increasing affordances for communication, pragmatics as a window into cultural practices of speaking will continue to be a hotbed of research built on inquiry from different academic fields.

Pragmatics and Grammar

GILA A. SCHAUER

Background

In his seminal publication on pragmatics, Leech argued that “grammar (the abstract formal system of language) and pragmatics (the principles of language use) are complementary domains within linguistics” (1983, p. 4). Native speakers and language learners need a certain level of both, grammatical and pragmatic competence, to communicate effectively in their everyday life. If a person’s grammatical competence in a language is low, they may find it difficult to produce and comprehend speech, as to do this they need to have a certain level of competence in the morphology, phonology, syntax, semantics, and lexicon of that language. If a person’s pragmatic competence is low, they may be able to produce an utterance that is formally correct, but may not realize that in a specific context and with a specific interlocutor their utterance is inappropriate, impolite, or both and may be misunderstood. Two sentences, both directed at a stranger in the street, illustrate the difference between grammatical errors and pragmatic infelicities:

- (1) Hello, can you me please tell where the station is?
- (2) Hello, tell me where the station is.

Upon hearing sentence (1), our stranger may think that their interlocutor is a learner of English and that the learner is still struggling with the correct word order in English, possibly as a result of transfer from their native language in which the equivalent sentence may be correct. Upon hearing sentence (2), however, our stranger may assume that their interlocutor is simply impolite, as in these particular circumstances, a more indirect request is generally used and expected in English. As Thomas argues, “grammatical error may reveal a speaker to be a less than proficient language-user, pragmatic failure reflects badly on him/her as a *person*” (1983, p. 97, original emphasis). This quote and the example sentences given above refer to adults speaking a second or foreign language (L2) and this will also be the focus of this entry (for a detailed discussion of children’s pragmatic and grammatical competence in their first language [L1] see Ninio & Snow, 1996; Ochs, 1996; Ninio, 2001).

Perhaps surprisingly given the body of literature in the fields of interlanguage grammar and interlanguage pragmatics (i.e., the grammar and pragmatics of L2 learners), the number of studies that investigate the relationship between grammar and pragmatics is relatively small. Reviewing research focusing on both pragmatics and grammar published before 1999, Bardovi-Harlig noted that “we find that, with very few exceptions, mention of grammatical competence is very brief and appears only in the discussion section as a possible interpretation of results” (1999, p. 687). Her view was shared by Kasper and Rose, who commented three years later that “most interlanguage pragmatics studies have singled out pragmatics as their sole focal object, commenting on grammar as one factor that might influence pragmatic development” (2002, p. 160). In recent years the number of studies examining the relationship between pragmatics and grammar has increased somewhat,

but compared to research conducted and published in other subfields of pragmatics, investigations that address interlanguage pragmatics and interlanguage grammar equally are unfortunately still few and far between. The main issue that has been addressed by researchers interested in learners' pragmatic and grammatical competence is in which order learners' competence in these two areas develops. In the following, findings will be presented for the claims that (a) pragmatics precedes grammar, (b) grammar precedes pragmatics, and (c) the acquisitional sequence of pragmatics and grammar depends on the learning context.

Development of Pragmatics and Grammar

“Pragmatic Competence Precedes Grammatical Competence”

One of the earliest studies that examined a learner's pragmatic and grammatical competence and concluded that pragmatics precedes grammar was conducted by Schmidt (1983), who observed one beginner-level learner of English in the second language context of Hawaii over a three-year period. In his investigation Schmidt focused on his learner's use of grammatical morphemes and pragmatic speech acts. At the beginning of the observational period the learner used a limited set of request strategies, such as asking for permission and hints, could accurately use the copula *be* in most instances, employed the irregular past and the plural correctly in some instances, but displayed some difficulty with the correct use of the progressive *-ing* and the auxiliary *be*. Toward the end of the three years, Schmidt noted no change to the copula, possessive, and auxiliary, although the correct use of the irregular past had increased. While the learner's grammatical development had been limited, his pragmatic development had shown greater progress, as his requests had become more elaborate and he had begun to use more direct strategies in situations where this was appropriate.

Also focusing on beginner-level learners, Koike (1989) and Pearson (2006) investigated requests produced by American university students learning Spanish. Koike found that while her learners seemed to be aware of the pragmatic norms regarding requests in their L1 and L2, their beginner-level knowledge of grammar made it difficult for them to produce appropriate requests. From her findings she concluded, “since the grammatical competence cannot develop as quickly as the already present pragmatic concepts require, the pragmatic concepts are expressed in ways conforming to the level of grammatical complexity acquired” (1989, p. 286). Pearson's findings support Koike's results.

A possible reason why L2 learners' pragmatic competence may precede their grammatical competence could be the transfer of pragmatic norms from the learners' L1. If L2 learners are competent members of their own L1 speech community, they are aware of what is considered appropriate and not appropriate in their L1 and may therefore be able to transfer certain norms and strategies to their L2. As Kasper (1997) put it so aptly, “adult NNS [non-native speakers] do get a considerable amount of L2 pragmatic knowledge for free.” Utilizing one's L1 pragmatic competence in the L2 may be only successful, however, if the pragmatic norms of the L1 and L2 are similar in many respects.

“Grammatical Competence Precedes Pragmatic Competence”

If we accept the argument that all fully socialized members of an L1 speech community have pragmatic knowledge that could be easily transferred to the L2 and modified if necessary, then the notion that grammatical competence in the L2 precedes pragmatic competence may seem surprising. Considering the findings of the studies investigating beginner-level learners in the section above, which found that pragmatics precedes grammar,

it may be even more puzzling that studies (e.g., Bardovi-Harlig & Hartford, 1990, 1993; House, 1996) have shown that even advanced L2 learners, such as university students majoring in the foreign language, often do not demonstrate a level of pragmatic competence that is congruent with their level of grammatical competence in their L2.

Bardovi-Harlig and Hartford (1990, 1993) found that compared to their native-speaker peers, highly advanced L2 learners studying for graduate degrees at an American university used fewer appropriate requests and suggestions in advising sessions with academic members of staff. Because of the learners' limited pragmatic competence in this context, they were less successful than the native-speaker students in negotiating an academic schedule that was in line with their own preferences during advising sessions that took place at the beginning of the academic year. Investigating the pragmatic fluency of German university students in English (i.e., the ability to produce speech in conversation that is effective, polite, and relates to the interlocutor's previous turn), House (1996) showed that even advanced L2 learners may not be able to formulate appropriate requests and may therefore not be able to obtain goods and services that they need. Not surprisingly, those of her learners that had spent a long period of time in an English-speaking country displayed a considerably higher level of pragmatic competence in their L2 than those learners who had not previously lived in the L2 context. A possible explanation for this is that those learners had more opportunities to observe and notice pragmatic norms in the second language context (see Schmidt's noticing hypothesis, 1993) than their peers who did not spend time in the target environment.

How can these seemingly contradictory findings be explained? It could be argued that the pragmatic competence of beginner-level L2 learners may be higher than their grammatical competence, because they may be able to transfer norms and rules from their L1, whereas it may not be as easy to transfer the lexicon, morphology, and syntax of their L1 to their L2. In addition, the studies examining beginner-level learners by Schmidt (1986), Koike (1989), and Pearson (2006) tended to examine speech acts in less complex and demanding conditions than the studies focusing on advanced learners by Bardovi-Harlig and Hartford (1990, 1993) and House (1996). With the exception of Schmidt (1983), all studies discussed so far have also not explicitly focused on the relationship of pragmatics and grammar and instead concentrated more on specific pragmatic phenomena, referring only briefly to L2 learners' grammatical competence.

Focusing more explicitly on the relationship between pragmatics and grammar, Salsbury and Bardovi-Harlig (2000, 2001) examined the development of modality in beginner-level learners of English in the United States over a one-year period. The researchers found that although there seemed to be a developmental sequence for modal expressions that emerged in interviews with the learners, with "maybe" and "think" preceding "can," "will," "would," and "could," the presence of the modal expressions in the learners' grammar did not necessarily result in the learners employing these expressions to mitigate their language when engaged in disagreements. Moving from modality to morphosyntax, Håkanson and Norrby (2005) examined the pragmatic and grammatical competence of intermediate and advanced Australian learners of Swedish. They focused on their learners' morphosyntactic and pragmatic turn-taking competence. Although the researchers did not observe large differences in their learners' pragmatic and grammatical scores, they noted that "overall the [learners'] level of grammar is slightly higher than the[ir] level of pragmatics" (2005, p. 155).

The findings of studies that investigate intermediate and advanced learners' pragmatic competence in their L2 tend to show that a certain level of grammatical competence does not automatically translate into an equivalent level of pragmatic competence. It is important to note though that, with the exception of Salsbury and Bardovi-Harlig (2000, 2001),

studies suggesting that L2 learners' grammatical competence develops earlier than their pragmatic competence tend to fall into two categories: (a) studies investigating learners in a foreign-language context and (b) studies that investigate learners in the second language context that have not lived in the target environment for very long. This suggests that the learning context may play an important role in the development of learners' pragmatic and grammatical competence, which will be explored in the following section.

“Acquisitional Sequence of Pragmatics and Grammar Depends on the Learning Context”

In recent years, a small number of studies have been published, all using the same data collection instrument, comparing L2 learners' pragmatic and grammatical awareness in two learning contexts: the second language context and the foreign language context. Bardovi-Harlig and Dörnyei (1998) focused on intermediate learners in the English as a foreign-language (EFL) contexts of Hungary and Italy, and the English as a second language (ESL) context of the United States, while Niezgodna and Röver (2001) compared advanced EFL learners in the Czech Republic with ESL learners in Hawaii. Using the same instrument, Schauer (2006, 2009) examined advanced EFL learners in Germany and advanced German learners of English in the ESL context of Great Britain. The data collection instrument developed by Bardovi-Harlig and Dörnyei was a video-and-questionnaire task containing scenarios with either pragmatic infelicities, grammatical errors, or no errors (controls). The instrument examined infelicities in four speech acts: apologies, refusals, requests, and suggestions. Typical pragmatic infelicities were asking for directions with an imperative and not offering an apology for not having prepared a presentation. Grammatical infelicities examined in the task included, for example, “a zero object (*yes I would like*), a double marking of the past (*I didn't brought it*), the use of the infinitive with *let's* (*let's to go to the snack bar*)” (Bardovi-Harlig & Dörnyei, 1998, p. 240).

The results of Bardovi-Harlig and Dörnyei's (1998) and Schauer's (2006, 2009) studies suggest that the learning context plays an important role in the development of learners' pragmatic and grammatical awareness. L2 learners in the ESL contexts of the United States and Great Britain recognized significantly more pragmatic infelicities than the EFL learners in Hungary, Italy, and Germany, whereas the EFL learners identified more grammatical than pragmatic infelicities. These findings indicate that the EFL context primes L2 learners' grammatical awareness, while the ESL context helps prime learners' pragmatic awareness. In the ESL environment, learners are exposed to the target language on a daily basis and they need to use their L2 in their everyday life for a wide variety of purposes (e.g., participating in seminars, opening a bank account, purchasing goods or services) and with a wide variety of interlocutors (e.g., professors, shop assistants, friends). To achieve their aims, L2 learners in the second language context need to be or become aware of the pragmatic norms of the target language quickly, as violating pragmatic norms can lead to their not achieving their aims (e.g., not receiving goods or services, not being granted permission to take certain university courses; see Bardovi-Harlig & Hartford, 1990, 1993). In contrast, making grammatical errors generally tends to have fewer negative consequences (Thomas, 1983) and native speakers do not regard it so negatively as committing a pragmatic infelicity (Schauer, 2009). In the foreign-language context, however, learners' exposure to the target language is frequently restricted to the classroom and to textbooks which tend to provide only limited pragmatic input (Bardovi-Harlig, 2001; Schauer & Adolphs, 2006). Learners' main aim in the EFL context is often to pass language exams that focus on learners' grammatical competence in their L2. It is therefore not surprising that EFL learners in Bardovi-Harlig and Dörnyei's (1998) and Schauer's (2006, 2009) studies displayed a higher grammatical than pragmatic awareness.

In contrast, Niezgoda and Röver's (2001) learners in the foreign-language context of the Czech Republic recognized significantly more pragmatic and grammatical errors than their learners in the second language context of the United States. A possible reason for these findings, which differ from those of Bardovi-Harlig and Dörnyei (1998) and Schauer (2006, 2009), may be the higher proficiency level of the Czech learners. Niezgoda and Röver's learners in the foreign-language context "differed radically from Bardovi-Harlig and Dörnyei's population in that they represented a highly select sample . . . [who had] pass[ed] rigorous written and oral entry examinations" (Niezgoda & Röver, 2001, p. 70). Their ESL learners in Hawaii also differed from the ESL learner groups in Bardovi-Harlig and Dörnyei's and Schauer's studies, as Niezgoda and Röver's ESL learners attended classes in a private language school in Hawaii, whereas the ESL learners in Bardovi-Harlig and Dörnyei's and Schauer's studies were enrolled at universities in the United States and Great Britain. Differences between their and Bardovi-Harlig and Dörnyei's learner populations were also noted by Niezgoda and Röver.

In addition to examining whether learners in a particular learning environment are better at identifying pragmatic or grammatical errors, the three studies also investigated whether learners in different learning contexts rated pragmatic and grammatical infelicities similarly or differently. The severity ratings Bardovi-Harlig and Dörnyei's (1998) and Schauer's (2006, 2009) learners assigned to the pragmatic and grammatical errors indicated a difference in their participants' perceptions across the two learning environments: The learners in the ESL contexts considered pragmatic infelicities to be more serious, whereas the learners in the EFL context considered the grammatical errors to be more serious. Interestingly, the severity scores given by the learners in the second language and foreign-language context were almost exactly the inverse of each other. The English native speakers that participated in Schauer's (2006, 2009) studies also rated pragmatic infelicities as significantly more serious than grammatical errors. In contrast to Bardovi-Harlig and Dörnyei and Schauer, Niezgoda and Röver's EFL learners did not perceive either pragmatic or grammatical errors to be significantly more serious than the other. Their ESL learners, however, considered pragmatic errors to be significantly more serious than grammatical errors. This finding is in agreement with Bardovi-Harlig and Dörnyei's and Schauer's studies.

Conclusion

To date only a limited number of studies on pragmatics and grammar have been published that focus on both areas equally. The results of studies examining the pragmatic and grammatical competence of language learners indicate that in many cases, learners' competence in pragmatics and grammar does not seem to develop to the same extent or possibly at the same time. In instructed foreign-language contexts, learners seem to be more competent in grammar than in pragmatics (e.g., Bardovi-Harlig & Dörnyei, 1998; Håkanson & Norrby, 2005; Schauer, 2006, 2009), whereas uninstructed second language contexts seem to facilitate learners' pragmatic competence more (e.g., Schmidt, 1983; Bardovi-Harlig & Dörnyei, 1998; Schauer, 2006). However, the effect of the second language context may not be immediate, especially in situations that learners may not be familiar with and may not be able to easily observe (Bardovi-Harlig & Hartford, 1990, 1993). It also needs to be noted, that these trends may not apply to all learner populations, as the results of Niezgoda and Röver's (2001) investigation have shown. More research is needed that provides more detailed insights into the relationship between L2 learners' pragmatic and grammatical competence and compares learners' level of pragmatic and grammatical competence across proficiency levels (i.e., beginner to advanced). As the number of studies that examine

pragmatics and grammar is still rather small, research is needed on many aspects of pragmatics and grammar, such as in-depth studies on phonetics and pragmatics, pragmatics and syntax, and pragmatics and the lexicon, to name but a few.

Pragmatics in Learner Corpora

NINA VYATKINA

Pragmatics has been broadly defined as the study of how people behave as social actors using language to accomplish specific communicative goals. Learner corpora are large electronic collections of written or spoken texts produced by learners of a second language (L2) in that language. Thus researchers of pragmatics in learner corpora explore how people learn to achieve communicative goals using an L2 by analyzing a body of texts produced by these learners in their target language.

Both pragmatics and learner corpus analysis are very young subdisciplines of second language studies. Interlanguage pragmatics, or L2 pragmatics, which investigates how L2 learners develop the ability to understand and perform action in a target language, arose as a separate field in the 1990s, whereas learner corpus analysis emerged as a method of research into learner language at the turn of the new millennium. Pragmatics and corpus analysis came together because both disciplines focus on actual language *use* as opposed to abstract qualities of language as a system. The main appeal of corpora for researchers into L2 pragmatics lies in the availability of large amounts of naturally occurring data, which gives them a much wider empirical grounding and supplements data elicited by traditionally used instruments such as questionnaires. Furthermore, corpus analysis methods allow automatic search for recurring patterns which can be analyzed using both quantitative and qualitative methods. These methods allow researchers to elicit information about the distribution and frequency of focal pragmatic elements in the target corpus, as well as about their cooccurrence with other elements. This latter technique, also called analysis of collocations, is especially valuable for pragmatics, who are less concerned with grammatical accuracy of utterances than with their contextual appropriateness.

Initially, pragmatics became interested in using native speaker (NS) corpora for both research and L2 instruction purposes. Many of these studies contained pedagogical suggestions for using NS corpora as rich repositories of authentic examples for creation of L2 teaching materials or for direct perusal by learners under the teacher's guidance. Around the turn of the century, this data-driven learning methodology was developed to include not only NS corpus data but also learner corpus data. The most important criterion of suitability of a learner corpus for research in pragmatics is the presence of explicit design criteria. As Granger (2002, p. 9) points out, "the usefulness of a learner corpus is directly proportional to the care that has been exerted in controlling and encoding the variables." Most important variables, according to Granger, are learner variables (e.g., learner context, mother tongue, level of proficiency) and task variables (e.g., time limit, use of reference tools, audience/interlocutor). Given the core position of the user and context in pragmatics, careful documentation of these corpus variables is of vital importance, which makes heterogeneous unspecified corpora unsuitable for L2 pragmatics research.

Beyond such metadata mark-up, corpora may be raw or annotated at different levels including part-of-speech tagging, syntactic parsing, discourse-pragmatic annotation, and error annotation of learner texts. Because such annotation is extremely time- and effort-consuming, the majority of available corpora to date remain raw, with a number of notable exceptions. Corpus annotation for pragmatic categories has been especially rare due to the inherent fuzziness and lack of distinct dividing lines between pragmatic categories such as speech acts. For example, an apology may partly overlap with a request rather than be

strictly separated from one another in speech. Therefore, an overwhelming majority of studies have been “word-based” rather than “category-based” (Hunston, 2002). For example, Gilquin (2008) explored how EFL learners used discourse markers in their speech. To extract linguistic data for her research, she specified the list of the target features to include such words and phrases as *you know*, *well*, *actually*, *sort of*, and ran an automatic search for these words on her learner corpus. In this bottom-up approach, researchers explore contextual use of specific linguistic features and then make inferences about pragmatic functions expressed by these words in learner texts. By contrast, researchers who are interested in finding out what sets of linguistic features are used by learners to express specific communicative functions apply a top-down approach and perform needs-based tagging of the focal corpora according to their specific research questions prior to the study. Connor, Precht, and Upton (2002) explored rhetorical devices used in an integrated learner/NS corpus of simulated job applications. First, the researchers defined what meaning units termed rhetorical moves (e.g., “identify the source of information,” “state desire for consideration,” “provide supporting arguments”) constituted the genre of application letters and compiled them into a rubric. Next, they manually tagged all corpus texts according to this rubric, and finally performed an automatic search on the focal tags. This analysis allowed the authors to identify similarities and differences in the discourse structure of application letters written by L2 English learners from different cultural backgrounds.

According to the medium, corpora are subdivided into written, spoken, and hybrid or multimedia corpora. Written learner corpora have been primarily explored using contrastive interlanguage analysis, or CIA (see Granger, 2002). This method enables comparison of learners’ L2 performance from the learner corpus with the first language (L1) performance of NSs from an NS corpus to discover differences and similarities in the language use of these two populations. Alternatively, researchers can compare different varieties of learner language (e.g., L2 use by more and less proficient learners). Pragmatic phenomena that have been best explored in written learner language include discourse markers, expressions of modality, and the use of formulaic language. The International Corpus of Learner English, or ICLE (<http://cecl.fltr.ucl.ac.be/Cecl-Projects/Icle/icle.htm/>), has provided material for numerous comparisons of pragmatic feature use by NSs and by advanced learners of English coming from a variety of L1 backgrounds. Aijmer (2002) showed that learners used significantly more modal verbs in their writing than NSs, which contributed to an overuse of spoken patterns inappropriate in a written academic genre. This result has also been corroborated on the material of a different learner corpus with the reversed configuration of languages: advanced L1 English learners overused modal expressions in their L2 German (Maden-Weinberger, 2008). Nesselhauf’s (2004) publication, based on the L1 German subcorpus of ICLE, focused on learner use of verb–noun phrases such as “to have a look” or “to make a mistake.” She found that even advanced learners frequently used inappropriate verbs in such phrases (e.g., “to do a mistake”). Gilquin, Granger, and Paquot (2007) investigated phraseological patterns used by learners in argumentative essays to express such typical rhetorical functions of English for academic purposes (EAP) as introducing, comparing, contrasting, and summarizing information. The researchers found that, without making grammatical mistakes, learners used some of these patterns inappropriately: for example, they overused intensifiers (e.g., *absolutely*, *of course*) and underused hedges (e.g., *possibly*, *presumably*) in comparison to an NS college writers’ group. This research resulted in a pedagogical application: the new corpus-based edition of the Macmillan English dictionary for advanced learners (Rundell, 2007) is interspersed with paragraph-long tips titled “Be careful!” and “Get it right” following the words and phrases habitually misused by ICLE participants. Rhetorical devices typical of EAP were also explored in expert and learner writing on the material of specialized corpora (e.g., Hyland, 2004).

Compilation of a spoken learner corpus presents an additional challenge because audio-recorded data need to be transcribed prior to analysis. In addition, even when transcribed in accordance with uniform conventions, the spoken language is more difficult to analyze with automatic methods because of significant variation in pronunciation of the same words. Despite this fact, spoken corpora have been attracting increasing attention because of the centrality of human interaction in pragmatics. One research direction is represented by Hasselgren (2002) and Gilquin (2008), who focus on Norwegian and French EFL learners, respectively. Both studies explored the use of discourse markers in speech and came to a converging result that increased speech fluency goes along with the use of more discourse markers such as *like, I mean, you know*, but fewer hesitation markers such as pauses. An example of research based on speech acts is Reinhardt (2007) who compiled and explored a corpus of oral data produced by international teaching assistants (ITAs) in advising and lecturing role plays. He compared the ITA use of directives with the NS comparison baseline elicited from MICASE (the Michigan Corpus of Academic Spoken English; <http://quod.lib.umich.edu/m/micase/>). He showed that ITAs underused mitigators and pragmatic features expressing interpersonal involvement in comparison to NSs. Reinhardt's study concludes with a pedagogical suggestion for corpus-based teaching. As opposed to word-based studies addressed above, Pavlenko and Driagina's (2007) took a concept-based angle in a comparative study of the use of emotion vocabulary in speech and showed that conceptual differences between English and Russian present difficulties even for advanced learners of these languages. Yet another direction in spoken corpus research is exploration of intonation patterns. Ramirez-Verdugo and Romero-Trillo (2005), for instance, found tone and pitch differences in realization of some speech acts by L1 and L2 speakers of English.

Diachronic corpora that contain data elicited from the same learners over longer periods of time are especially valuable for studying pragmatic development of L2 learners. However, these are rare because collecting longitudinal data is especially difficult. Nevertheless, a number of longitudinal learner corpora have been collected and have triggered innovative studies into L2 pragmatics. Researchers at Georgetown University have collected and investigated a longitudinal corpus of written productions of learners of German, tracking them over the course of three curricular levels. Among other focal features, Byrnes (2009) investigated the development of the grammatical metaphor (primarily expressed in increasing nominalization) in learner writing. The longitudinal approach to data analysis allowed the researcher to demonstrate the nonlinearity and variability of developmental paths taken by individual learners. Another example is a unique longitudinal multimedia corpus that includes audio and video recorded classroom interaction data that have been collected over several years at Portland State University. Using the conversation analysis methodology, Hellermann conducted several case studies using this corpus to track the development of individual learners from beginning to intermediate levels of ESL proficiency. Focusing on specific pragmatic phenomena such as saying "no" in refusals, Hellermann (2009) conducts microanalyses of the talk-in-interaction at multiple points in time and shows how the learner is gradually socialized in the classroom community of practice.

Another invaluable resource that can be accessed on the internet is the French Learner Language Oral Corpora (FLLOC) database that compiles a number of spoken L2 French corpora (<http://www.flloc.soton.ac.uk/>). Myles, Mitchell, and Hooper (1999) explored formulaic language and creative constructions in learner language with one of these corpora and showed both common developmental trends and dynamic interaction between these features. Finally, a number of longitudinal corpora collected in untutored L2 acquisition settings from adult immigrants have served as the basis for multiple studies of L2 pragmatics (see Skiba, Dittmar, & Bressemer, 2008). These are currently being systematized in

accordance with recognized computational standards and published on the internet by the Max Planck Institute in Nijmegen (http://corpus1.mpi.nl/ds/imdi_browser/).

Most recently, learner corpora containing texts produced in so-called hybrid media such as computer-mediated communication (CMC) have proven rich in pragmatic phenomena. Such corpora have an advantage of containing interactive exchanges typical of spoken conversations yet do not require tedious transcription since the data are produced in a written medium. Classroom-based CMC between learners and NSs can be especially conducive to study of L2 pragmatic development as shown by Belz and Vyatkina (2008). In this study, the synchronous (electronic chat) and asynchronous (e-mail) interactions between learners and NSs revolved around a semester-long class project where the American and German participants discussed intercultural topics and wrote collaborative essays that triggered involvement in a variety of speech acts such as invitation, refusal, and apology. Electronic data produced by learners in CMC interactions with their NS interlocutors were automatically saved and then organized into an electronic corpus. Importantly for CIA research, this corpus also included a built-in NS corpus that served as a valid comparison baseline for learner productions since the NS data came as part of the very same interactions, not from an unspecified external corpus. Moreover, the corpus data were used for a concurrent pedagogical intervention in which learners engaged in corpus-based learning comparing their own and NS use of the focal pragmatic features (German modal particles and pronominal adverbs). The study showed that this approach facilitated L2 pragmatic development because students significantly increased their focal feature use and even approximated the NS norm with respect to frequency and appropriateness. However, the study also highlighted persistent differences in collocational patterns used by learners and NSs.

To advance corpus-based research into L2 pragmatics, there is a need for many more studies on publicly available corpora. New corpora also need to be collected, especially oral and multimedia corpora based on a variety of languages collected from learners at different proficiency levels, as well as developmental corpora tracking the same learners over longer periods of time. Given the resources and time that go into pragmatic annotation, sharing annotated corpora is especially desirable. An excellent example is an undertaking by Maynard and Leicher (2007), who set out to manually annotate MICASE. They plan to annotate this corpus for 25 pragmatic features including discourse style and interactivity (e.g., disagreement, request, humor, sarcasm) that will be computer-searchable. This project is especially valuable because MICASE is freely available and comprises both NS and learner speech samples, thus providing a valid NS comparison baseline for performing CIA. When completed, the annotation of this corpus will facilitate investigations that are lacking to date: ones that will go beyond words and phrases and extend into speech acts and communicative functions which may have multiple linguistic realizations.

Pragmatics in the Analysis of Discourse and Interaction

MARTIN WEISSER

What Is Pragmatics?

Pragmatics, as a linguistic discipline, broadly deals with the analysis and recognition of *meaning* in texts. However, in which way this type of meaning is distinct from that investigated by its neighboring discipline, semantics, is still a matter of debate among at least some linguists. One thing is clear in this respect, though, which is that, in pragmatic meaning, *contextual* influences play a far larger role than in its semantic counterpart. To begin our identification and discussion of the issues that may be involved in the *generation* of pragmatic meaning (see Verschueren, 1999) in and through context, it is perhaps best to start by looking at the contrasting ‘attitudes’ expressed by different researchers in the field toward what exactly belongs to the field of pragmatics.

‘Schools’ of Pragmatics

As already hinted at above, there are in fact two different traditions in pragmatics, sometimes referred to as the “Anglo-American” and the “European Continental” schools (Horn & Ward, 2004, p. x). The first subscribes to the “**component** view” (p. x), a view that sees pragmatics as a separate level of linguistics—such as those of phonetics/phonology, syntax, and semantics—and the second adopts the ‘**perspective** view’ (p. x), which sees pragmatics as a function of language that influences the other levels and incorporates a larger situational context that also includes sociolinguistic factors. Following Leech (1983, pp. 10–11), the former can also be referred to as “PRAGMALINGUISTICS” and the latter as “SOCIOPRAGMATICS.”

Although both approaches are strongly influenced by concepts originating in the analysis of dialogue in *conversation analysis* (CA), proponents of pragmalinguistics still tend to focus more on issues that relate to the ‘sentence’ or *micro-level* (see Mey, 1993, p. 182), often also employing more hypothetical, constructed examples, whereas sociopragmaticists prefer to concentrate more on real-life examples and larger contexts, that is, the *macro-level* (p. 182). A further trait of pragmalinguistics is a strong philosophical background that frequently expresses itself in the use of analyses that employ the same type of traditional formal logic we also encounter in formal semantics.

General ‘Theoretical’ Issues in Pragmatics

Amongst the more theoretically oriented topics investigated by both schools, mainly on the micro-level, are *implicature*, *presupposition*, *reference*, *deixis*, *definiteness*, and *indefiniteness*, as well as *speech acts*. As implicature is explained in detail elsewhere in this volume, only some brief examples of some of the other concepts are provided here, but speech acts will be discussed in more detail later.

Presupposition

Presupposition refers to the fact that, in any conversation or text, certain elements of a discussion can be assumed to be known or understood without first having been explicitly introduced. Thus, if I ask you *When did you stop smoking?*, the underlying assumption is that, prior to this moment, there was actually a period where you were in the habit of smoking. Often, presuppositions like the above are linked to certain grammatical constructions that involve:

1. a change of state, as in the above example;
2. so-called *factive* verbs, such as *regret*, as in *I regret the decision I made yesterday*, where the assumption is that I did indeed make a decision at the said time;
3. *implicative* verbs, such as *manage* or *succeed*, as in *They managed to finish and hand in their essays on time*, which presupposes that the agents (*they*) had to make an effort to achieve this outcome;
4. some form of iteration, as in *I had to go to the office again.*, which expresses the fact that I had already been there at least once before (presumably today);
5. and so forth.

A similar thing happens when I tell you that *My brother is older than me*, when you did not even know that I had a brother in the first place. However, rather than complaining about the fact that I had not mentioned my having a brother before, you will simply assume this as being true, unless, of course, you have any reason to doubt my sincerity.

Reference, Deixis, and (In-)Definiteness

As already pointed out above, when we talk about ‘things,’ we always do this in a certain context, and within this context, it is important to identify the participants in a verbal exchange, as well as locating this exchange and its participants in space and time. Identifying who or what exactly we are talking about is generally a question of assigning an explicit reference to a particular person or entity. Linguistically, this can be achieved by using a deictic or ‘pointing’ expression, such as a pronoun (*I, you, they*, etc.), demonstrative (*this, that*, etc.), a (definite) noun phrase (*the woman on the other side of the road, the Queen of England*, etc.), or a proper noun/name (*John, Mary*, etc.).

If a person is the target of the reference—and especially if there is a personal pronoun involved, we speak of *person deixis*, as in *Can I ask you something?*, where *I* and *you* both identify speaker roles in the verbal interaction. If the reference takes the form of a temporal adverbial (construction), such as in *We’ll be there tomorrow*, this is referred to as *temporal* or *time deixis*, which serves to ‘locate’ the utterance relative to the current time; if it (literally) locates something in space, relative to the speaker and hearer, this is known as *spatial deixis*.

One thing that is particularly interesting about many of the shorter expressions used in these types of deixis is that they only take on an exact meaning in a particular context, but are otherwise semantically rather vague, something that led the philosopher Frege to draw a distinction between the *sense* of an expression, that is, the basic, decontextualized meaning, and its actual *reference* (see Carlson, 2004). This distinction can easily be made clear by looking at the meaning of the local adverb *there* in the last example because we can only really be sure about its exact meaning if we are aware of where the place referred to is located relative to the speaker and hearer, either because it is physically pointed at or the location is definitely already known to all parties involved.

Two special types of deixis are *social* and *discourse deixis*. The former is basically a type of person deixis, but with the additional feature of indicating the social ‘status’ of the

interlocutors. This may take the form of *honorifics*—such as the use of *Sir* or *Madam*—in English, indications of the degree of familiarity, such as in the use of different second personal pronouns in French (*tu* vs. *vous*) or German (*du* vs. *Sie*), or even different speech styles (or levels) that may involve changes in vocabulary and morphosyntax (as in, for example, Korean) at the same time. These are also closely linked to issues of *politeness*, which is another topic that figures prominently in some types of pragmatics.

Discourse deixis, on the other hand, can be seen as a special type of local or temporal deixis because it locates utterances not in the ‘physical’ space or event structure the interlocutors find themselves in, as we saw in our earlier examples, but actually creates references to prior *co-text*, as in expressions like *As I mentioned earlier . . .*, or *On page 22. . .*

The issue of definiteness versus indefiniteness basically revolves around the degree of ‘familiarity’ or ‘unique identifiability’ that is expressed through a reference. Thus, for example, definite articles and pronouns that occur in or as a noun phrase are generally assumed to produce the most specific references that easily help us to identify a referent unambiguously, while indefinite articles or general quantifiers, such as *some* or *any*, supposedly work less well for uniquely identifying a referent (see Abbott, 2004). However, there are some problems with these assumptions, as you can easily see if you look at sentences like *I just saw a man standing across the street and looking into our window* or the frequently cited *The king of France is bald*, where in the first example, clearly a very specific man, performing a specific action, is referred to using an indefinite article, while in the second example, a nonexistent personality is referred to via a so-called *definite description*, that is, a noun phrase with a definite article.

Speech Acts and Cooperative Behavior

The notion of speech as a kind of action was originally expressed by the ‘ordinary language philosopher’ Austin in his book *How to Do Things with Words* (Austin, 1962). There, he contradicted the traditional assumption, dating back to the days of Aristotle, that *sentences* are only used to express *propositions*, that is, facts that are either **true** or **false**:

It was too long the assumption of philosophers that the business of a ‘statement’ can only be to ‘describe’ some state of affairs, or to ‘state some fact’, which it must do either truly or falsely. (Austin, 1962, p. 1)

To prove this point, he developed the theory of *performative verbs* (pp. 14–24), that is, verbs whose use actually constitutes an action, such as *promise*, *christen*, *name*, *declare*, and so forth, which are generally also used in conjunction with a first person pronoun and can also be reinforced by the adverb *hereby*, as in, for example, *I hereby declare this meeting closed*. He later extended this theory into a more general theory of verbal action that distinguished between three different types of function of an utterance:

1. *locution(ary act)*
2. *illocution(ary act)*
3. *perlocution(ary effect)*. (pp. 98–101)

Function (1) essentially comprises the (physical or syntactic) form of the utterance, (2) the basic intention of the speaker in producing it, and (3) the effect it produces in the hearer. Let’s try to clarify this using an example: if I say something like *Can you reach the top shelf?* to you, then the locutionary act would simply consist in me uttering these words with the appropriate rising intonation, the illocutionary part would most likely be me indirectly asking you for help in getting something off this top shelf (that I myself cannot

reach), and the perlocutionary effect would hopefully be for you to recognize my indirect question and ask me in turn what I'd like you to fetch for me from there. However, according to Austin, these functions can only be successfully performed if a number of felicity conditions ("Conditions for Happy Performatives") (Austin, 1962, pp. 12–13) are fulfilled, for instance that the hearer understand and accept the intentions of the speaker or that certain conventions or conventional procedures are followed, such as, for example, in a marriage procedure.

John Searle later developed Austin's ideas further and even claimed that speech acts play *the* most central role in communication:

The unit of linguistic communication is not, as has generally been supposed, the symbol, the word or sentence, but rather the production or issuance of the symbol or word or sentence in the performance of the speech act . . . More precisely, the production or issuance of a sentence token under certain conditions is a speech act, and speech acts . . . are the basic and minimal unit of linguistic communication. (Searle, 1969, p. 16)

To differentiate between the 'locutionary elements' of a sentence, he draws a distinction between "propositional" and "illocutionary force indicator[s]" (p. 30). The force of an utterance, according to him, is indicated through "illocutionary force indicating devices" (or IFIDs, for short) which include "word order, stress, intonation contour, punctuation, the mood of the verb, and the so-called performative verbs" (p. 30).

He identifies five main classes of speech acts, *assertives* (e.g., stating, claiming, reporting), *directives* (e.g., ordering, requesting, demanding), *commissives* (e.g., promising, offering), *expressives* (e.g., thanking, apologizing, congratulating), and *declarations* (e.g., resigning, dismissing, sentencing, christening).

In an attempt to explain how meaning can be expressed and understood in such an 'indirect way,' another ordinary language philosopher, H. P. Grice, formulated the *cooperative principle* (often abbreviated CP). In this, he basically claims that participants in a verbal interaction behave largely cooperatively, both in the construction and interpretation of what they say. The CP embodies a set of *categories*, generally these days referred to as *maxims*, although Grice himself in fact used this term to refer to the subparts of each category. A brief summary of these categories is given below:

1. Quantity: 'say just as much, but no more, than required.'
2. Quality: 'only say what you think is true and you can prove.'
3. Relation: 'only say what is relevant.'
4. Manner: 'be clear, unambiguous, and brief.'

The CP has often been criticized a series of strict rules that are generally untenable, but what most of its critics seem to have overlooked is that they are just guidelines for best case behavior, as well as expressing certain expectations most interlocutors would bring into a verbal exchange, anyway. However, there are certainly accidental or deliberate cases—referred to as *flouting*, *violating*, *infringing*, *opting out of*, or *suspending* one or more of the categories (see Thomas, 1995, for some examples)—where the CP is not adhered to in almost all conversations.

As there seems to be a certain degree of overlap between the different categories of the CP, frequent attempts were made to reduce and 'streamline' the categories involved in explaining the mechanisms involved in the cooperative construction of meaning, most notably by Sperber and Wilson, Horn, and Levinson. The simplest of these is Sperber and Wilson's, who make do with only a single principle, that of *relevance*, claiming that "the expectations of relevance raised by an utterance are precise and predictable enough to guide the hearer toward the speaker's meaning." (Wilson & Sperber, 2006, p. 608)

At the next level, we find Horn's dual distinction between the **Q**(quantity) and the **R**(elation) principle (Horn, 1984, p. 13), where the former incorporates the 'sub-maxims' "MAKE YOUR CONTRIBUTION SUFFICIENT" and "SAY AS MUCH AS YOU CAN" (p. 13) and the latter "MAKE YOUR CONTRIBUTION NECESSARY" and "SAY NO MORE THAN YOU MUST" (p. 13).

In contrast to Horn, Levinson posits the three principles of **Q**(quantity), **I**(nformativeness), and **M**(anner), where the latter may be better classified as *markedness*, though. One further important distinction to both Grice and Horn is that each of Levinson's principles involves cooperative efforts on both the part of the speaker and the hearer.

Technically speaking, though, one could argue that both Horn's and Levinson's principles do not really represent full reductions of the Gricean system, in particular also because they both still do not seem to fully reject the role of *Quality* (Horn, 1984; Levinson, 2000), but which simply does not form part of their systems, as they are primarily concerned with implicatures and inferencing.

Pragmatics Applied

Having discussed all the relevant theoretical issues in pragmatics, we can now turn to the practical aspects of how and where these theories have been and may be applied in the analysis of discourse and interaction. Issues like reference, deixis, and (in)definiteness, which are more grammatical in nature, can relatively easily be incorporated into the regular investigation and teaching of grammar, usually in the context of analyzing written language. Here, we would mainly be dealing with issues such as *cohesion* or *coherence*. Research into the former can improve our understanding of how texts 'hang together' through the use of conjunctions, ellipses, pro-forms, and so forth, and which strategies allow authors to link up the different parts of a text to improve its flow, as well as to make it more 'compact' by eliminating redundancies. Investigating coherence, although it may formally involve some of the same features, is more concerned with identifying the logic behind the sequencing of utterances, whether reference is assigned unambiguously, and deixis successfully employed to reflect spatial and temporal order or meaning.

Those issues like presupposition, implicature and speech acts that embody even more context-dependent cooperative or cultural/conventional mechanisms, as well as maybe a certain degree of indirectness, and tend to involve more lexicogrammatical or semantic aspects, are much more difficult to handle because they follow less clearly defined or researched patterns. Due to this fact, research into them has often been focusing on speech acts in relation to exchange structures in spoken interaction, as in the Birmingham tradition of *discourse analysis* (see Coulthard, 1992), which initially concentrated on classroom interaction, or on identifying certain social norms and sequencing of speech events, two of the major foci in *conversational analysis* (see Seedhouse, 2005). More recent approaches to discourse analysis, as well as sociopragmatics, also tend to focus more strongly on the sequencing and social aspects of linguistic utterances, investigating issues such as *adjacency pairs* or *preferred responses*, which has also had an influence on communicative approaches to language teaching. Different other strategies of verbal interaction, such as the use of *discourse markers* (Jucker & Ziv, 1998; Fischer, 2006), *backchannels*, or the use of (meaningful) *filled pauses*, have more recently also become more of a focus of attention. Issues of politeness and its relationship to (in)directness have been investigated in studies on cross-cultural and interlanguage pragmatics (see Rose & Kasper, 2001, or Bardovi-Harlig, 2002, for some general background).

As pointed out earlier, though, a fair degree of the 'research' in the Anglo-American tradition is still carried out using constructed examples, so the adoption of a more data/corpus-oriented approach in general would certainly be preferable. Research in *corpus*

linguistics and attempts in computational linguistics to improve *dialogue systems* (Leech & Weisser, 2003) have already led to the development of extended *speech act taxonomies* or other aspects (Allen & Core, 1997) of identifying the different levels of meaning involved in constructing meaning in dialogues. Identifying these different levels then also makes it possible to annotate large bodies of data (semi-)automatically, for which both statistical (Stolcke et al., 2000) and symbolic (Weisser, 2004) means have been developed.

Although it is of course still possible to conduct non-computer-based pragmatic analyses in the traditions referred to above, a more widespread dissemination and adoption of pragmatically annotated corpora for research would probably make it considerably easier to investigate all the diverse topics in spoken and written interaction.

Pragmatics of Asynchronous Computer-Mediated Communication

KEIKO KITADE

Computer-mediated communication (CMC) refers to any communication that occurs when human beings interact with one another through messages exchanged via networked computers. Asynchronous CMC (ACMC) occurs when users are not online simultaneously while the messages are exchanged; messages are stored until the user appears online. The distinction between synchronous and asynchronous CMC is controversial because some devices are used for both communications, and the chat feature is not fully synchronous in terms of the process of message transmission (e.g., Garcia & Jacobs, 1999). There are various modes of ACMC, including text-based one-to-one (e.g., e-mail), multiple participants (e.g., Listserv, discussion forum, Twitter, or Wikipedia), or feedback-oriented (e.g., blogs and Web pages). In addition, some audio- or audiovisual-based ACMC media (e.g., Wimba, voice mail) are also available, and many sites that enable multimodal forms of communication combining various types of CMC (e.g., social networking) have become popular.

Over the last 20 years, as CMC use has increased exponentially, it has been increasingly recognized as a genuine mode of communication, and an increasing number of studies have focused on language use in ACMC (also known as asynchronous computer-mediated discourse or ACMD). During the early development of ACMC, most studies focused on the specific characteristics of ACMC compared to traditional modes of communication (e.g., face-to-face) and synchronous CMC. However, more recent studies in ACMC pay attention to the new context that emerges with ACMC and attempt to identify its contextually specific interactional features. This shift in focus is found in studies of both general and L2 (second or foreign language) contexts; however, the new contexts that ACMC offers to L2 education contribute significantly to the pedagogy and methodology of L2 pragmatics in particular. Therefore, this area is discussed separately.

Medium-Specific Features of ACMC

The interactional and discourse features of CMC are more distinct and reflect a more complex evolution than merely the aggregation of spoken and written modes. CMC is often referred to as “Netspeak” (Crystal, 2001), a definition that clearly identifies it as a style of communication that is distinct from traditional modes of communication. Indeed, most studies in the early development of CMC compared ACMC with face-to-face communication by focusing on the negative or restrictive features that are specific to ACMC (e.g., reduced social cues, less interactive, less coherent); this focus encouraged the development of innovative discourse features to overcome or utilize such features.

Most CMC media that emerged during the early development of CMC were text-based; therefore, one of the salient features of ACMC that was recognized early on was “reduced social contextual cues” (i.e., prosodic cues such as intonation, tone of voice, gesture, and facial expressions). The effect of “reduced social cues” has been analyzed from different approaches. “Reduced social context cues theory” (Sproull & Kiesler, 1991) compares

2 PRAGMATICS OF ASYNCHRONOUS CMC

the participation patterns of social factors in a face-to-face meeting with a computer-conferencing system and finds that a lack of social contextual cues inhibits the influence of social factors such as gender, age, ethnicity, and social status. This inhibition results in more equal participation and increases the level of aggression among participants. The “social identification/deindividuation effect” (SIDE) model (e.g., Lea & Spears, 1991) suggests that the participants in CMC heavily rely on remaining social cues (e.g., gender, status, categorical membership, word choice), and that certain stereotypical expectations influence user attitudes and behavior. Furthermore, the hyperpersonal model (Walther, 1996) reveals that online participants take advantage of the communicative limitations of CMC and select intentionally to present positive and desirable cues to their partners. Participants with more exposure to CMC tend to utilize such features and create more thoughtful and carefully edited messages.

The availability of editing time may enhance such features in ACMC and may affect the level of formality and politeness that participants use. While some researchers have claimed that ACMC is often less formal or polite than traditional forms of written interaction, other researchers have suggested that the limited time that is available for constructing and editing messages in ACMC may increase the writers’ focus on the contextual appropriateness, which may result in the use of more formal and polite language (Herring, 2002). Bisenbach-Lucas (2006, 2007) examined e-mail requests written by graduate students to their professors; he found that e-mail communication is also sensitive to situational factors (i.e., status differences, level of imposition, and the role and obligation of participants) in the same way as traditional modes of communication (i.e., more direct strategies are used for lower-imposition requests). Another important study, which compares e-mail and voice mail (Duthler, 2006), suggests that e-mail often offers the opportunity for increased politeness, owing to the practical opportunity to edit the document. However, some studies of ACMC found that the types of conventions used in ACMC, and the frequency with which they were used, varied considerably according to user exposure to the usage of specific ACMC (e.g., Gains, 1999).

In addition, the time intervals that exist between the types of exchanges encourage a distinct discourse structure in comparison to synchronous communication. ACMC users are more constrained in turn taking and topic management in comparison to users of synchronous communication, due to the lack of immediate feedback and multiple topics in a message (Herring, 1999). Sotillo (2000) compares synchronous and asynchronous online discussions by ESL students and suggests that, with their question-response-evaluation format, the former offer an interaction that is closest to that of traditional classroom interaction. The reduced interactivity that is an unavoidable characteristic of asynchronous and text-based communication encourages ACMC to enable multiple functional moves at once (e.g., initiation and responsive actions). In addition, related moves are often located apart, which can make them appear incoherent. Because of this apparent incoherence, initiation moves in ACMC (such as questions and requests) are frequently ignored or more overtly expressed. Those who are involved in asynchronous discussions utilize their editing time by applying innovative strategies to control the quality of the necessary and limited information that is exchanged (e.g., by providing optional information in parentheses as a secondary resource) and to maintain semantic coherency (i.e., topic thread) over multiple, sometimes disordered, moves (e.g., by explicitly referring to the topics in previous messages in the response, quoting previous messages, and naming addressees).

While ACMC has its own unique interactional features, it varies significantly according to medium and situational factors. Herring (2007) suggests that some technological features in CMC (i.e., synchronicity, message transmission, persistence of transcript, size of message buffer, channels of communication, anonymous messaging, etc.) should be considered for CMC analysis.

The Variation of Pragmatic Features in ACMC Contexts

Apart from medium factors, Herring (2007) incorporates Hymes's classification in spoken discourse and describes some social and situational factors that may influence CMC (i.e., participation structure, participant characteristics, purpose, topic or theme, tone, activity, norms, and code). Some earlier studies (e.g., Herring, 2000) suggest that such interactional patterns in ACMC vary according to the static social attributes of the users (e.g., age, gender, or nationality), while more recent studies emphasize the contextually sensitive aspects of ACMC and further consider each ACMC context as a "speech community" where members actively construct community-specific language.

In addition to the characteristics of the participants, other situational factors of each community also shape its ACMC. For example, the choice of formal or casual linguistic style or politeness levels may vary according to the norms of each discussion forum (e.g., Nishimura, 2008). Moreover, while advising in general is considered as a threatening act, a study of peer advice in a public blog community (Kouper, 2010) suggests that advising in the community frequently promotes personal information sharing and thereby contributes to community building. Some more recent studies, particularly those that adopted a constructivist approach, find that interactional features are community-specific and constructed through the development of the online community. The development of a community is indicated with the change of language use in the work of Cassell and Tversky (2005). In their study, at an online intercultural discussion held over a three-month period, participants' use of the first-person singular pronoun decreased as their regional differences receded and they gradually became part of the community. In sum, contextual factors as well as technological factors influence the types of ACMC, and certain types of linguistic behavior may also promote community building. The growing number of social networking sites promotes various types of virtual contexts where members not only exchange information but also engage in community-specific activities.

Pragmatic Features of ACMC in L2 and L2 Learning Contexts

Studies examining the role of ACMC in L2 contexts no longer focus solely on investigating specific advantageous features that ACMC can offer in an L2 learning context; instead, most now explore the new contexts that ACMC allows L2 learners to access. These studies emphasize the media-specific features of ACMC in the L2 context, and suggest that CMC encourages discourse that is more student-oriented and encourages student initiative and equal participation. Asynchronicity itself allows students to plan their discourse, which encourages them to use language that is more syntactically complex (Sotillo, 2000) and appropriate to the context.

An e-mail from a student to a professor is one of the most common modes of ACMC. However, Asian non-native speakers (NNSs) tend to use a style that is distinct from that of NSs (native speakers), in terms of their use of mitigation, emphasis on personal needs, use of more direct requests, and use of lexical rather than syntactic politeness (e.g., Bisenbach-Lucas, 2007). How NNSs express politeness is dependent on the linguistic context, and can vary according to the effect of the pragmatic transfer from L1 or the learner's lack of L2 linguistic knowledge. Most studies find that the time offered to L2 learners by ACMC is usually insufficient for them to overcome such differences and that pedagogical intervention is necessary for L2 learners who often communicate with e-mail in their learning context. These comparative e-mail studies have also highlighted the methodological limitations of applying the Cross-Cultural Speech Act Realization Project (CCSARP) framework developed by Bulm-Kulka, House, and Kasper (1989) to this context. Bisenbach-Lucas (2006) suggests that the analysis of speech acts and e-mail is naturalistic data, and that the

coding category of CCSARP, which was developed as a discourse completion test, needs to be revised to ensure that it can be applied to new media.

One of the most significant advantages of CMC in the L2 classroom is the opportunity for students to engage in meaningful interaction with native-speaking keypals over an extended period. Computer-mediated partnerships function without geographical and temporal restraints (e.g., Belz & Thorne, 2006) and can thereby connect culturally divergent participants through a virtual community. Some studies in computer-mediated partnerships emphasize the availability of an authentic target language (TL) model, particularly in terms of the pragmatic aspects that native-speaking keypals can help to clarify. Other studies have focused on raising awareness of intercultural aspects by encouraging the establishment of personal relationships in the intercultural community.

Utilizing the exposure of TL input in a computer-mediated partnership, Vyatkina and Belz (2006) carry out a corpus-driven study to examine the development of L2 pragmatics. As CMC enables storage and documentation of interactions, both NSs and learner corpora are valuable elements in the instruction of pragmatics. The NS corpus is used as a TL model, against which the NNS corpus is compared, to indicate the learners' difficulties. This innovative corpus-driven approach can enhance the methodological and pedagogical dimensions of L2 pragmatics. It offers the methodological advantage of documenting the learners' pragmatic development alongside longitudinal data. By tracking how learners' interpragmatic production develops, the factors that determine this may be identified. Vyatkina and Belz (2006) examine the use of the German modal particle (MP) in learner corpus (e-mail and chat) to reveal learner development patterns; they suggest that the formulaic use of MP and the particular function of MP that is presented in the pedagogical intervention are more likely to be replicated in subsequent messages. CMC also leads to the availability of authentic materials that can be useful for L2 pragmatic instruction. Not only are documented NS corpora genuine, but they also allow learners to build an interpersonal relationship through interaction. Vyatkina and Belz (2006) conduct a contrastive learner corpus analysis to examine the effect of different types of pedagogical interventions in CMC contexts; they find that learners have increased metapragmatic awareness and that explicit overenhanced instructions are more effective than other types of interventions.

A growing number of studies in computer-mediated collaborative learning highlight the role of intercultural relationship-building encouraged by CMC, particularly where L2 learners become increasingly aware of pragmatic aspects (Kramsch & Thorne, 2002). L2 learners frequently face conflict in their expectations and communication styles when engaging in online intercultural communication (such as text formality or frequency of postings). Thus, pedagogical intervention is necessary if learners are to have the opportunity to reflect on their interaction and the significance of such conflicts. This reflection raises learners' pragmatic and cultural awareness, deepens their understanding of other cultures, and encourages a de-centered perspective, all of which are crucial for intercultural communication. As CMC enables multicultural communication for L2 learners, both in institutional and noninstitutional contexts, it is clear that L2 language education can benefit from the focus on interpersonal relationship-building, where pragmatic aspects play a significant role.

Conclusion

In recent years, the significance of ACMC has changed drastically, as has the focus of studies into the pragmatic aspects of ACMC. The focus is no longer on the media-specific features of ACMC, but rather on the new contexts that ACMC provides, particularly on the contextually sensitive and dynamic interactional features of ACMC. Studies of how ACMC functions in L2 contexts no longer only emphasize the effect and utilization of

ACMC; instead, most studies now investigate actual ACMC contexts encountered by L2 learners and examine how this intercultural communication improves learners' pragmatic and cultural awareness. These shifts in focus suggest that the pragmatic features of a particular ACMC are not simply a result of the media or device itself; rather, they are shaped by the particular ACMC context, which is defined by learner negotiations of communication styles. As technology and ACMC continue to progress, the accessibility and usage of ACMC (e.g., using multiple and hybrid channels of communication, the growing use of social networks and mobile devices) and learners' exposure to varied online contexts will continue to influence the future development of ACMC.

Pragmatics of Chat

CARL S. BLYTH

Introduction

The term “chat,” when used in association with computer-mediated communication, refers to synchronous computer-mediated discourse (SCMD) that takes the form of either private interaction (e.g., one-on-one communication via instant messaging) or public interaction (e.g., group communication in a chatroom). Pragmatic research on SCMD focuses on how linguistic signs are employed in chat contexts and how different meanings and intentions are negotiated among social participants through online interaction. The pragmatic analysis of online chat entails the examination of heterogeneous linguistic phenomena and comprises different approaches and subfields—speech act theory, conversation analysis, ethnomethodology, interactional sociolinguistics, and critical discourse analysis—to name but a few.

In the first section of this entry, the fundamental properties of messaging systems that affect the pragmatics of chat discourse are described. In subsequent sections, pragmatic features typically associated with chat discourse are categorized and discussed in terms of computer-mediated discourse analysis (CMDA). CMDA is a synthetic approach that emphasizes the centrality of discourse for understanding online behavior (Herring, 2004). CMDA organizes research methods and issues around four domains of language: structure (typography, orthography, morphology, and syntax), meaning (speaker intention and illocutionary force), interaction (turn taking and discourse coherence), and social behavior (power, gender, and identity). Thus, following CMDA, this entry organizes pragmatic chat phenomena according to the three above domains relevant to the study of pragmatics: meaning, interaction, and social behavior. The phenomena are not intended to be exhaustive, but rather to represent the different types of pragmatic chat research conducted within these domains. In the final section, promising lines of future research are discussed.

Fundamental Properties of Chat Messaging Systems

Herring (2001) stresses that different properties of computer messaging systems, such as synchronicity, transmission type, and modes of communication, have a profound impact on the pragmatics of online discourse. *Asynchronous* forms of computer-mediated discourse (ACMD), such as e-mail or threaded discussion groups, do not require users to be logged on at the same time in order to communicate. In contrast, chat environments, private or public, are *synchronous*, meaning that they require users to be logged onto the same program at the same time in order to exchange messages. The synchronous nature of chat discourse results in ephemeral and dynamic messages; one message quickly follows another message, thereby creating a flow of discourse in the chat program’s interface. As a consequence, users must periodically scroll down in the chat interface to keep up with incoming discourse (Werry, 1996).

Text-based chat has been the focus of the majority of published research due to its historical precedence, although spoken chat communication via Skype and other forms of Voice-over-Internet-Protocol (VoIP) transmission are gaining in popularity. Herring (2001)

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0940

contends that most users view text-based chat as inherently conversation-like. The most obvious evidence for this claim is the common term itself—*chat*. In general, the term refers to any unplanned conversational discourse of an informal nature. As such, the term typically indexes genres that exhibit features of informal orality. (See the 2011 special issue of the online journal *Language@Internet* for a complete analysis of “computer-mediated conversation.”)

Another important property of chat messaging systems is their facilitation of either one-way or two-way transmission. One-way transmission means that a recipient cannot view a sender’s message while it is being composed. In one-way transmission, the recipient must wait for the sender to submit or send the message before it appears on the recipient’s screen. Two-way transmission allows a recipient to see a sender’s message as it is being composed. Most first-generation chat programs are one-way transmission only. However, “highly simultaneous,” two-way transmitted chat is becoming popular (Anderson, Beard, & Walther, 2010). In addition to the features of synchronicity and transmission type, chat can also be classified in terms of modes—text only or text plus video, audio, and graphics. First-generation chat is largely text-based, whereas second-generation chat is increasingly “bimodal” or “multimodal,” that is, textual messages accompanied by audio, video, or both. Finally, bimodal or multimodal chat is typically conducted by means of two-way transmission, that is, the recipient can hear the sender’s audio or see the sender’s video in real time.

Meaning

Pragmatic meaning refers to contextualized meanings of words and utterances (e.g., speech acts) and larger functional units (e.g., “macrosegments,” Herring, 1996). Studies investigating the intended meaning of online participants’ linguistic production typically invoke the well-known pragmatic constructs of speech acts, illocutionary force, face, and politeness. This line of research is exemplified by studies conducted on the pragmatic meaning of emoticons (short for “emotion icons”) that proliferate in chat, as well as e-mail, blogs, and bulletin boards (Merchant, 2001; Baron, 2004; Provine, Spencer, & Mandell, 2007). These graphic signs are usually characterized as either iconic indicators of emotion that map directly onto facial expressions (e.g., :-(to indicate unhappiness), or as indicators of non-emotional meanings mapped conventionally onto facial expression (e.g., ;-) to indicate joking or :-0 to indicate shouting). Dresner and Herring (2010) contend that, in addition to facially associated meanings, emoticons may function as indicators of illocutionary force, that is, as an index of the relevant speech act being performed by the utterance. As an example of this pragmatic function, Dresner and Herring (2010, p. 258) cite the following exchange posted to a help chatroom on the Internet service provider AmericaOnline (AOL):

JKingsbury : GUIDE>have you ever made a home page on aol?
Guide ASH : JK, yes and I can’t get rid of the stupid thing! ☺

The smiley face emoticon changes the interpretation of the guide’s utterance from an unhelpful and selfish gripe into a “humorous complaint that demonstrates a friendly attitude towards the user” (Dresner & Herring, 2010, p. 258). The characterization of emoticons as “shorthand substitutes for longer textual expressions of intention” is corroborated by the comparatively higher rates of emoticon usage in synchronous chat where efficiency considerations play an important role in communication (Dresner & Herring, 2010, p. 261).

Emoticons have also been analyzed in terms of the pragmatic notions of face and politeness. Brown and Levinson (1987, p. 61) conceptualize face as “the public self-image that every

member wants to claim for himself, consisting in . . . negative face [and] . . . positive face" (p. 61). Reframing face and politeness in conversation analytic terms, Golato and Taleghani-Nikazm (2006) claim that adherence to the preference organization of talk-in-interaction is generally interpreted as polite behavior, whereas deviation from preference organization is interpreted as impolite behavior. More specifically, Golato and Taleghani-Nikazm (2006) demonstrate that face-threatening acts in chat discourse, such as requests, are typically marked by emoticons along with other graphic features of dispreferred structures (e.g., smiley faces to mitigate the impact of a request and a series of dots or dashes to display hesitation or delay). They suggest that these chat features are "graphic representations of affiliative nonverbal behaviors in ordinary conversation such as facial expressions, intonation contours, and interactional delays, all of which are missing from online communication" (p. 318).

Interaction

Research on chat interaction has primarily focused on turn taking, discourse management, and the creation of communicative coherence. Following the influential model of Sacks, Schegloff, and Jefferson (1974), turn taking is conventionally viewed as a system comprising turn construction and turn allocation. Turn construction refers to the form of a turn-at-talk, that is, whether it is constructed of a word, a phrase, a clause, or a complete sentence. Turn allocation refers to the techniques used by participants to select speakers. In addition to these concepts for understanding patterns of interaction, Schegloff and Sacks (1973) emphasize the importance of the *adjacency pair*, that is, the notion that communication is fundamentally based on a sequence of paired actions (e.g., question/answer, first assessment/second assessment).

Several researchers have challenged the applicability of face-to-face turn taking as an explanatory model for CMC interaction (Cherny, 1999; Herring, 1999; McKinlay, Procter, Masting, Woodburn, & Arnott, 1993). Herring (1999) identified two major obstacles to smooth turn taking in CMC environments: the lack of simultaneous feedback and the disruption of turn adjacencies. Because chat messages are displayed in terms of when they are received by the server, the turn-taking system is often disrupted and therefore not always helpful for interpreting a message's contextual relevance. In other words, chat discourse appears to be more fragmented and potentially incoherent than face-to-face discourse (Herring, 1999). To overcome this problem, participants in public chats often employ the compensatory strategy of *addressivity*, the practice of explicitly naming the recipient of a message in the body of the message itself (Werry, 1996).

Recent studies have problematized the binary distinctions of earlier studies such as oral versus written and face-to-face versus online. Anderson et al. (2010) studied the effects of highly simultaneous chat systems to determine whether participants would adopt face-to-face techniques for turn allocation. The data showed that chat participants did not adopt the *no gap, no overlap* ideal of spoken conversation, but rather creatively employed the use of overlapping intermittent messages followed by strategic pauses. Similarly, Condon and Čech (2010) studied the discourse management strategies adopted by dyads engaged in decision-making interaction in three modalities: face-to-face, synchronous chat, and asynchronous e-mail. Their findings show that many features commonly associated with writing may be better understood as characteristic of asynchronous communication. Baron (2010) tested the common assumption that instant messaging (IM) mirrors informal spoken-language turn construction by analyzing IM conversations among American college students in terms of the intonational unit as operationalized by Chafe (1994, 2001). Her data demonstrated an interaction between gender and spoken versus written norms. Male

dyads tended to break their messages into smaller units resembling spoken discourse norms, whereas female dyads produced messages that demonstrated more similarity with written syntax.

Social Behavior and Identity Construction

Another line of SCMD pragmatic research has focused on the correlations of macro-sociological categories (e.g., gender, age, ethnicity) with identifiable social behaviors and styles. The goal of this research is to understand how identities are constructed using the linguistic and extralinguistic resources afforded by different online environments. Of all the social identities analyzed in these studies, gender has been the most frequently examined. In the early 1990s, Herring (1992, 1993, 1994) conducted a series of studies that focused on male and female stylistic patterns in academic discussion forums. Herring's data showed that men were less polite and more adversarial than women, who used more hedges and politeness markers. However, studies of chat environments gave mixed results. Cherny (1994) noted stereotypical gendered behavior in interaction in MOOs, a type of multiparticipant virtual reality game ("MOO" stands for "MUD object-oriented"). Similarly, in a study of Internet relay chat, Herring (2003) noted that females used more positive emoticons while males were more aggressive and overtly sexual. In contrast to these findings, Rodino (1997) reported that Internet relay chat promoted play with traditional gender identities. And Danet (1998) found that traditional gender binaries tended to break down in MUDs (multiplayer real-time virtual worlds) due to the greater anonymity afforded by these environments. ("MUD" stands for "multiuser dungeon," "multiuser dimension," or "multiuser domain.") Finally, several studies have suggested that traditional gender distinctions may be giving way to a more gender-neutral style favored by teenagers in CMC environments (Gross, 2004; Subrahmanyam, Greenfield, & Tynes, 2004).

Future Research

Herring (2002) argues that future CMC research must address several biases: a text bias, a group bias, and a synchronic bias. To date, most of the studies have focused on text-based interaction, and yet audio and video chat technologies are rapidly replacing text-only chat. Future research will need to explore the challenges of multimodality in all its forms. What are the advantages and limitations of different modalities—audio, text, video—for different communicative purposes? What kinds of information do these different modalities carry? How do they interact to create meaning? Current research has also privileged the study of public chatroom discourse over the study of private forms of chat such as instant messaging. Herring (2002) contends that researchers should not assume that findings for group communication scale to small groups or one-on-one communication. And finally, after nearly two decades of data collection, researchers have amassed CMC corpora that would allow for larger-scale, longitudinal studies to explore the evolution of online communicative practices. In light of this wealth of data, Baron (2010) calls for future studies that compare a wider range of data, for example, comparisons of chat practices of different age cohorts (middle schoolers vs. college students vs. adults) as well as comparisons of different nationalities. Do users change their chat practices as they grow older? Do teenagers today employ more gender-neutral discourse styles than an earlier generation of chatters? Do findings for American chat differ from cultures where mobile phone texting is more deeply entrenched, for example in Europe and Asia? Despite these new research questions, one thing is clear: New modes of communication such as online chat are changing the pragmatics of how people interact; and the study of these

new practices and conventions for L1 (and increasingly L2 speakers) will continue to grow in the coming years.

Pragmatics of Lingua Franca Interaction

JULIANE HOUSE

This entry looks at the pragmatics of today's most important lingua franca: global English. In the first part, the concept of "lingua franca," the nature of English as a lingua franca (ELF), and the role ELF has come to play in a globalized world are described. Second follows a review of several empirical studies on the pragmatics of ELF, and finally some conclusions are drawn.

What Is a Lingua Franca?

In its original meaning, a lingua franca—the term comes from Arabic *lisan al farang*—was simply an intermediary or contact language used, for instance, by speakers of Arabic with travelers from Western Europe. Its meaning was later extended to describe a language of commerce, a rather stable variety with little room for individual variation. This meaning is not applicable to today's foremost lingua franca: global English, whose major feature is its enormous functional flexibility and spread across many different linguistic, geographical, and cultural areas, as well as its openness to foreign forms. In both its international and intra-national use, ELF can best be regarded as a special type of intercultural communication where each combination of interactants, each discourse community, negotiates its own lingua franca use in terms of code-switching, discourse strategies, negotiation of forms, and meanings.

In its role as an auxiliary language, English can be compared to Latin at the time of the late Roman Empire, or French in the 17th and 18th centuries. When the so-called Western world in the second half of the 20th century came to depend on border-crossing communication; political, economic, and scientific cooperation; and supranational organization, it so happened that English was in the right place at the right time (Crystal, 1997). By then English had spread into so many ethnically diverse societies, and had already acquired some cultural distance from its original British culture. It therefore offered itself as a convenient language for communication. Another, more linguistic factor that helped propel English into a position of first choice for an auxiliary language is the fact that English has long been, especially in its lexical repertoire, a rich mixture of Romance and Germanic languages, languages of supra-regional importance in their own right.

ELF is not in any sense a restricted language, but a means of communication showing full linguistic and functional range. Users of ELF are not "learners," but rather multilingual individuals possessing "multicompetence" (Cook, 1992), which is to be taken as a yardstick for describing and explaining ELF communication. Relevant is here the rich literature on bilingualism, where the notion of a "simultaneous activation" of speakers' native tongue and ELF in the cognitive structures of bilingual subjects is widely accepted today (Grosjean, 2001).

A major characteristic of ELF is its multiplicity of voices. ELF is a language for communication, a medium that can be given substance with different national, regional, local, and individual cultural identities. When English is used in interactions between, say, German, Spanish, and French native speakers, the differences in native interactional norms,

standards of politeness, and feelings of cultural and historical tradition may remain intact. These norms are not shared, nor need they be. Localized or regionalized ELF varieties—whose linguistic surface is English, but whose speakers creatively perform pragmatic shifts in using ELF—are now taking over the linguistic landscape. Non-native speakers of English anywhere in the world are developing their own discourse strategies, speech act modifications, and communicative styles in their use of ELF.

ELF is no more and no less than “a contact language between persons who share neither a common native tongue nor a common national culture, and for whom English is the chosen foreign language of communication” (Firth, 1996, p. 20). How do people manage to make this type of communication work? In what follows, a number of studies that have examined ELF speakers’ interactional behavior will be discussed.

Pragmatics and Discourse-Related Studies of ELF: Some Research Findings

An important early work on ELF pragmatics is Meierkord’s (1996) analysis of audiotaped English dinner table conversations elicited in a British student residence from subjects of many different L1 backgrounds. She examined opening and closing phases, gambits, topic management, politeness, turn-taking, overlaps, and hesitation phenomena, and found surprisingly few misunderstandings. Trouble spots were usually not overcome by negotiations but by often-abrupt topic changes. Further results include a reduced variety of tokens, shorter turns than in native English talk, frequent use of nonverbal supportive back-channeling, especially laughter, and little interference from L1 discourse norms.

Some of Meierkord’s findings were confirmed by Firth (1996) and Wagner and Firth (1997) who analyzed telephone conversations between employees of Danish companies and their foreign partners, supplementing their analyses with ethnographic information. The authors stress the “fleeting” nature of ELF talk, the fluidity of norms and participants’ attempts at conversational attuning resulting in overtly consensus-oriented interactional behavior and in interactants’ attempts to “normalize” potential trouble sources in a preventive way, rather than attend to them explicitly, via repair initiation, reformulation, or other negotiating behaviors.

As long as a threshold of understanding is achieved, ELF participants adopt a “let-it-pass” principle, an interpretive procedure which makes the interactional style “robust,” “normal,” and consensual. This ordinariness is a joint achievement of interactants, who manage to sustain the appearance of normality despite being exposed to relatively “abnormal” linguistic behavior. Achieving ordinariness is the direct outcome of the “let-it-pass” procedure, to which interactants resort whenever understanding threatens to become difficult. The “ordinariness” of ELF discourse is also achieved via a “make-it-normal” orientation: when ELF speakers are faced with interlocutors’ marked lexical and phonological selections, unidiomatic phrasings, morphological vagaries, and idiosyncratic syntactic structuring, they deliberately divert attention from these infelicitous forms. This behavior is also evident in the surprising absence of “other repairs” and requests for information or confirmation, as these might expose interlocutors’ linguistic “deficits” and threaten their face. They appear to be competent enough to be able to monitor each other’s moves at a high level of awareness preventing breakdown through helping each other in collaborative action and joint discourse production.

An important general characteristic of ELF talk is its inherent variability (Firth, 2009). This variability is not to be equated with ELF speakers’ failure to fulfill native norms, and their widely varying levels of competence in English. Rather it lies at the core of ELF

discourse, where speakers creatively exploit, intentionally appropriate, locally adapt, and communicatively align the potential inherent in the forms and functions, items, and collocations of the virtual English language they use in their performance as the need arises (Seidlhofer & Widdowson, 2007).

If ELF interactants do not seek to adjust to some real or imaginary native speaker norm, they do not conceive of themselves as learners of English as a foreign language either but rather as individual ELF users united in different “communities of practice” (Wenger, 1989; House, 2003, for application of the concept to ELF research). The notion “community of practice” is most appropriate for ELF in that the constitution of a community of practice is governed by a joint purpose, that is, to communicate efficiently in English as the chosen and agreed means of communication without, however, heeding or being constrained by English native norms.

A project specifically concerned with discourse pragmatics is the Hamburg ELF project (House, 2002, 2008, 2009; Baumgarten & House, 2007, 2010a, 2010b; House & Lévy-Tödter, 2009, 2010). Here we have collected conversational everyday ELF interactions between international students of many different L1s, institutional ELF discourse between students and faculty as well as post-hoc interviews. (This is a special domain corpus. The biggest available source of ELF data to date is VOICE, the Vienna–Oxford International Corpus of English.) The analyses of this data essentially confirm previous findings. However, several other characteristics of ELF interactions have also emerged. They will be discussed in what follows.

Recourse to L1: Pragmatic Transfer and Code-Switching

Pragmatic transfer from L1 occurs frequently in ELF discourse. Thus, Asian speakers often employ cyclical topic management, which results in non-sequitur turns-at-talk that are, however, consistently ignored by other participants, such that the talk remains “robust,” “normal,” and never breaks down (House, 2002). Another example of pragmatic transfer is the use of L1-specific conventions of directness. For instance, speakers of L1 German use speech acts with the high directness level conventionalized in German (Blum-Kulka, House, & Kasper, 1989), but not in English or ELF (for details see House, 2002). In the post-hoc interviews, interactants themselves ascribed such an interactional style to native discourse norms. Further, the frequent use of repetitions in ELF talk by Asian speakers not only serves to support speakers’ working memory and ease processing, but can also be interpreted as pragmatic transfer from Asian languages as a sign of politeness, because explicitly verbalized acknowledgement of alter’s message is considered face-supporting and consensus-building.

The second L1 related strategy is code-switching used in ELF talk mostly to overcome speakers’ linguistic limitations (House & Lévy-Tödter, 2009, 2010). A case in point is the use of L1 discourse markers (such as the German gambit *ja*), in particular “uptakers” and “go-ons” (Edmondson & House, 1981). Uptakers usually occur as second-pair parts of exchanges, and go-ons are used as back-channel devices, both expressed with reduced self-monitoring, that is, automatically, “off-guard.” That switching into one’s mother tongue should occur in this particular interactive slot is thus easily explained. Similar findings of the frequent use of code-switching in ELF talk are reported in Pözl and Seidlhofer (2006) with reference to the use of Arabic gambits and other L1 derived discourse phenomena, and by Jenkins (2009) who found many instances of code-switching by ELF speakers of Asian L1s. Cogo (2009) also documents code-switching in ELF discourse. Interestingly, she also found that interactants sometimes switch not to their respective L1s but to a third shared language.

Accommodation: Re-Presenting Information

In ELF talk (parts of) previous speakers' moves are frequently "represented" (House, 2002). "Represents" (Edmondson, 1981) are multifunctional gambits used to support speakers' working memory; to create coherence via the construction of lexical-paradigmatic clusters; to signal receipt and confirm comprehension. All of these uses can be interpreted as a deliberate accommodative strategy to ELF speakers' particular needs. Represents are also known in the literature as "echo-," "mirror-," or "shadow"-elements that typically occur in psycho therapeutic interviews, instructional discourse and aircraft control discourse—genres in which information is deliberately and routinely restated to ensure understanding. The fact that ELF speakers exploit this convention for their own benefit shows that their strategic communicative competence is well developed. Cogo and Dewey (2006) and Cogo (2009) also document many instances of accommodation and strategic repetition in their analyses of ELF talk.

Solidarity and Consensus via Co-Construction of Utterances

ELF speakers consistently demonstrate solidarity and consensus in the face of marked linguistic and cultural differences. For instance, speakers often help one another in cases of formulation problems, joining forces to build up gradually and jointly the discourse in a series of scaffolding moves (House, 2003, 2008). Participants' attempts to negotiate what it is that each one of them wants to convey lead to a feeling of community, solidarity, and group identity.

Re-Interpretation of Discourse Markers *You Know*, *I Think*, *I Don't Think*, *I Mean*, *Yes*, *So*

The pragmatic behavior of the discourse markers *you know*, *I think*, *I don't think*, *I mean*, *yes*, and *so* in ELF discourse differs from English native discourse.

You know is often described as an interpersonally oriented marker used as a hedge and signaling politeness. House (2009) reports that ELF speakers tend to re-interpret *you know* as a more self-referenced way of highlighting formulation difficulties and providing coherence in speakers' own turns. *You know* frequently co-occurs with the conjunctions *but*, *and*, *because*, even taking over their functions in stand-alone position. It is also used when speakers reveal planning difficulties by fumbling for an appropriate formulation. In such cases, *you know* is used in mid-utterance, often inside nominal, verbal, and adverbial groups to help speakers process and plan their own output, and to link stretches of discourse.

The discourse markers *I think*, *I don't know*, and *I mean* also tend to be re-interpreted in ELF talk (Baumgarten & House, 2007, 2010a). In contrast to native English use, ELF speakers often employ these markers in their prototypical meanings, preferring formal structures (main clause complement structures) over the more grammaticalized structures and pragmatic meanings expressed in the verbal routine forms used in native English speech. For instance, *I think* is often used in ELF talk to express speakers' subjective opinion, and *I don't know* functions as a signal of speakers' insufficient knowledge about the discourse topic. *I mean* is often used in ELF talk with a strong evaluative element over and above its main function of reformulation/clarification. It then acts as a focalizing device in a speaker's contributions, and serves as a point of departure for an explicit expression of subjective evaluation, expressing affective involvement in the topic and the discourse (Baumgarten & House, 2007).

The gambit *yeah/yes* is used in ELF talk with a variety of different functions (Spielmann, 2007; Baumgarten & House, 2010b) such as uptaking, back-channeling, agreeing, and

discourse structuring. All of these uses are potent tools for making the discourse (appear) “normal.” The inherent face-saving feature of *yeah/yes* and its overall inoffensive accommodating undertone make it particularly suitable for ELF talk, where interactants are well aware of the precarious nature of their intercultural interaction. ELF speakers therefore often exploit the positive import of *yeah/yes* to downtone objections. Like *you know*, *yeah* can also serve as a self-supporting strategy. But the frequent use of *yeah/yes* in ELF discourse is probably best explained with its polyfunctionality, which renders it “communicatively effective” because a lot of pragmatic content is packed into minimal verbal form. Findings in Baumgarten and House (2010b) and House and Lévy-Tödter (2010) also point to an interesting systematic variation in the use of the tokens *yes*, *yeah*, and German *ja*: *yes* is primarily used as an agreement marker, *ja* as a back-channeling device, and *yeah* as an uptaking and structuring signal supporting speakers’ own moves and turns.

The marker *so* also functions as a speaker-supportive element in ELF discourse. *So* is here used as a deictic element to both support the planning of their upcoming moves and help them summing up previous discourse stretches. *So* functions as a complex double-bind element, a (mental) hinge between what has come before and what will occur next. It certainly does not index other-attentiveness, and is not used with a strong interpersonal function. Rather *so* takes on a text-structuring, self-attentive, and self-monitoring function, acting for instance as a stop-gap “fumble” (Edmondson, 1981) to help speakers bridge formulation problems. In the majority of occurrences, *so* follows hesitation markers such as “erm” or “hmm,” or pauses, and it also often collocates with the connector *and*. All these co-occurrences show that *so* in ELF talk acts as a self-prompting strategy to monitor own output and mark the resumption of speech after being “bogged down” both turn-initially and in mid-turn.

Conclusion

Given the linguistic potential of the English language available for creative appropriation and local re-interpretation, ELF speakers competently engage in self-help interactional behavior both for their own and their interlocutors’ benefit, supporting each other’s speech production, tolerantly letting others’ oddities and infelicities pass, and generally managing to make interactions robust and normal. ELF users are bilingual or multilingual speakers who have more than one language at their disposal, and they show this in the way they mark identity, attitudes, and alliances, signal discourse functions, convey politeness, create aesthetic and humorous effects, or pragmatic ambiguity and so on. In ELF research, we have seen a radical rethinking of the norm against which speakers’ pragmatic discourse behavior is matched. This norm is never the monolingual native speaker, but rather the expert multilingual user. ELF users’ pragmatic fluency (House, 1996) and their strategic competence enables them to engage in meaningful effective communication, and to alternatively adhere to their L1 discourse pragmatic norms as a strategy of identity maintenance or construct new ELF norms to foster a sense of group identity in their local communities of practice. Both strategies are effective and contribute, in their different ways, to ELF users’ increasing independence from English native speaker usage.

Pragmatics of Second Language Computer-Mediated Communication

LAWRENCE WILLIAMS

This entry provides an overview of issues related to the pragmatics of second language (L2) computer-mediated communication (CMC) with a focus on synchronous CMC (SCMC), which involves real-time exchanges between or among participants. Although the creation of the Internet and widespread access to the World Wide Web are relatively recent developments, there is an ever-growing body of research on CMC as a tool for communication and language learning, which has been fostered by the creation of academic journals that report such research (e.g., *CALICO Journal* and *Language Learning and Technology*). However, not all subfields of second language acquisition (SLA) and CMC have received the same amount or type of attention. Such is the case of pragmatics, which is much younger as a subfield of linguistics than syntax, morphology, and phonology.

As pragmatics is a more recently recognized area of inquiry in its own right, many researchers and teachers are still attempting to define and shape its aim(s) and scope. Nonetheless, Belz (2008, p. 45), for example, notes that “There is a general consensus among scholars that *pragmatics* involves the study of communicative language use in sociocultural context.” The primary goal of pragmatics research is to investigate not only how language is used, but also how language is perceived and interpreted by others within a given context, which may itself be difficult to delimit and define given the fluidity of participants’ relationships with one another and the ever-changing nature of communicative environments.

Fundamental Issues

In text-based SCMC, such as chat, it is important to recognize that the contextual factors and cues available to participants are often quite different from those available in face-to-face or *viva voce* (e.g., telephone) exchanges. This does not, however, mean that chat participants necessarily experience uneasiness or difficulty communicating with each other. They simply rely on the text-based discourse being produced in a real-time setting to develop a sense of the linguistic and social patterns that are used and anticipated by members of any given online community.

Interactional Competence

The important issue here, then, is to realize that SCMC poses different challenges for learners. In much of the (SLA) literature, for example, SCMC has often been—and still is—compared to traditional discourse as being deficient or lacking with regard to various types of information about participants and visual cues (although for other perspectives see Chun, 1994; Kroonenberg, 1994; Warschauer, Turbee, & Roberts, 1996); while this may indeed be the case—when compared to spoken discourse in many communication environments—such comparisons serve only to reinforce the false assumption that SCMC should or should not be different from or similar to either traditional spoken or written discourse. In order for learners to understand how to communicate in linguistically and

socially appropriate ways in any SCMC setting, they will need to understand both medium-related aspects of SCMC and how a variety of linguistic and pragmatic devices are deployed in L2 online communities.

The Structure of CMC Interaction

The structure of interaction is another fundamental issue that creates both pragmatic stumbling blocks and learning opportunities for L2 SCMC participants. However, as is the case for the issues discussed in the previous paragraphs, this affects both native speakers (NSs) and non-native speakers (NNs) to varying degrees and in different ways. No two SCMC environments are alike with regard to the number of participants present and the number of messages being typed (i.e., participants' level of activity), which means that turn taking and the adjacency of turns exist on a continuum: At one end, turn taking is quite orderly and easy to follow (in audio and video CMC, for example), yet at the other end, turns are taken in a seemingly random way, since so many pairs that are normally adjacent are dislocated or disrupted, as in text-based CMC (see Herring, 1999; Williams, 2004). Successful communication will depend, at least partially, on participants' ability to match or rejoin disrupted segments of adjacency pairs so that, for example, a seemingly malevolent statement can be interpreted appropriately as either an attempt at humor or an insult. Likewise, it will be necessary to understand that many statements and questions will simply receive no uptake—for whatever reason—especially in contexts where increased activity makes it impossible to maintain and link a multitude of conversational strands at the same time among dozens of participants. According to some of the existing research, L2 learners are capable of maintaining successful interactions (especially when few participants are involved) much in the same way that first language (L1) speakers are able to do (González-Lloret, 2009). L2 learners are able not only to maintain interaction but also to orient to the task they are performing and the language they use (Williams, 2003; González-Lloret, 2009), negotiating their interactions much as NSs do (Tudini, 2007). Recent studies have also explored how the medium of communication affects the interaction itself by exploring, for example, interruptions in the CMC composition process (Smith & Sauro, 2009), and turn taking and overlaps in voice CMC (Jenks, 2009). More studies are needed to understand exactly how and to what extent the medium affects the structure of L2 CMC and what pragmatic effect it has on the interaction.

Addressivity and Social Indexicality

The majority of L2 SCMC research has focused on learners interacting with other members of the same class or level; however, more recently, there has been an increasing number of studies involving telecollaboration (i.e., learners paired with L2 NSs, usually learners of the L1 of the other class), often involving both SCMC and asynchronous CMC (ACMC) (i.e., communication taking place at different times). For example, a series of SCMC and ACMC studies by Kinginger and Belz (Kinger, 2000; Belz & Kinginger, 2002, 2003; Kinginger & Belz, 2005) exploring L2 second-person pronoun use as an important component of pragmatic competence clearly demonstrates that knowing forms (e.g., *tu/du* 'you' or *vous/Sie* 'you') is not sufficient for understanding the social consequences associated with using these forms in socially (in)appropriate ways. The research program by Belz and Kinginger (2003) has revealed that "developmental pathways toward address form use are idiosyncratic," and "historically constituted, through participation, by and for each individual language user" (pp. 641–2). In addition, other variables may also play a role in the acquisition of addressivity in CMC such as learners' characteristics, amount of communication, and participant engagement (González-Lloret, 2008a).

The social consequences of using and interpreting pragmatic dimensions of language (e.g., second-person pronouns that serve as markers of grammatical number and social indexicality) therefore emerge as a central concern of L2 SCMC pragmatics, since participation structures involving NSs tend to have characteristics that are different from those involving NNSs interacting with each other. Williams (2003) and McCourt (2008, 2009), for example, both studied (text-based) SCMC among NNSs (i.e., L1 English learners of French) at different levels of development grouped together, specifically students enrolled in the first three semesters of French at two public US universities, with one learner from each level per triad. Contrary to the findings of Belz and Kinginger (2002, 2003), Kinginger and Belz (2005), and González-Lloret (2008a, 2008b)—whose students were involved in telecollaborative work with NSs—the studies by Williams and McCourt found the learners who interacted with other learners in an *intra muros* setting commented on or noticed inappropriate *tu* (T) ('you' singular, informal) and *vous* (V) ('you' singular, formal, or plural, informal/formal) use fewer than a handful of times. Moreover, even when the (possibly inappropriate) use of T or V was raised by another learner as an issue to be resolved, it was summarily ignored by the participants, all of whom were other learners who understood that it meant *you* as a form of address, even in the case of a translation task where only either T or V would have been appropriate in specific items. The studies by Williams and McCourt, which were designed as diagnostic tools to evaluate specific morphosyntactic and sociopragmatic dimensions of the discourse of learners, demonstrated that learners engaging in NNS–NNS (i.e., learner–learner) interaction will likely require supplemental training (see Williams, 2004) or expanded opportunities for participation in a variety of social situations in order to develop (increased) pragmatic awareness.

Other Pragmatic Research in CMC

Some other studies in the area of pragmatics have explored L2 speech act acquisition (refusal and invitations) through written and oral chat (Sykes, 2005), but the other main area of research has been on the development of intercultural competence via CMC.

Schneider and von der Emde (2006) provided a glimpse into L2 pragmatics in SCMC within the wider scope of the development of intercultural competence. Their study focused on the analysis and management of conflict in telecollaborative environments, and they concluded that “fostering intercultural ‘intellectual relations’ should also be an important component to any (online) intercultural exchange at the university level” (p. 200). Similarly, Tudini (2007) examined the extent to which “NS chat rooms provide opportunities for learners to practice intercultural (content and pragmatic) negotiation strategies” (p. 585). Her results suggest that chat interaction can serve as a learning tool that includes the potential to foster intercultural communicative competence through negotiation, which can be “triggered by pragmatic and culture-specific content, with learners demonstrating initiative and questioning techniques as intercultural speakers” (p. 596).

Directions for Future Research

Although possibilities for future studies on the pragmatics of L2 SCMC are seemingly limitless, teachers and learners could benefit from at least three specific lines of inquiry: (a) analysis of learners' participation in non-educational CMC environments, (b) complementary quantitative and qualitative research methods and analyses, and (c) integration of human-mediated and computer-mediated communication into the same task or series of related tasks as a way of providing a more authentic or realistic communicative environment for L2 learning.

In addition to these specific lines of inquiry, it seems quite likely that video chat (see Eröz-Tuğa & Sadler, 2009) might emerge as a preferred type of SCMC (for learners and non-learners alike), since real-time audio and video will allow participants to regain some of the contextual cues and pragmatic dimensions of language that have been missing from some instantiations of text-based SCMC. In the past, although real-time video conferencing (e.g., Kinginger, 1998) has been an option for telecollaborative learning, cost seems to have constrained its use. However, due to the current availability of increasingly large amounts of relatively inexpensive bandwidth in a growing number of countries, it should soon be possible for video chat to be used widely as a tool for language learning and communication (e.g., Yanguas, 2010).

Pragmatics of Short Message Service

ANNA SPAGNOLLI

Definition

Technically speaking, the short message service (henceforth “SMS”) is a system that allows the exchange of textual messages from one mobile phone to another. These messages (also called “texts” or, simply, “SMSs”) are composed by typing on the keyboard of the phone; they are immediately delivered with an “alert” signal, and read/replied to by the receiver at his or her convenience. Although the purpose of a text can also be to send commercial information (medical, financial, and so forth), the research on the pragmatics of SMS has focused so far on SMS exchanges for personal communication. Also, although the technology allows one to send a message to many receivers, the vast majority of the studies consider one-to-one exchanges as the prototypical kind of relation supported by this service.

Before going into the details of the practices of personal SMS communication, it is necessary to understand where SMS communication can be positioned with respect to other communication modes, and the main implications of such a positioning in terms of finding the origin of a certain communication practice.

The broad category in which SMS communication falls is mediated communication, because a technology provides the venue on which the communication encounter can take place. This venue is not metaphorical or virtual, as one might think: it is supported by physical technologies; it has spatial and temporal coordinates; and is characterized by inhabiting practices including access regulation. It does not consist of the mere resources of the technical medium; rather, it depends on the ways in which these resources are singled out by the user, enriched with symbols, made sense of with usage practices. The communication environment is thus a hybrid of technical and symbolic resources, a compound that is captured in the literature by the concept of “socio-technical package” (Kling, 1980). The principle for understanding mediated communication is that communication practices and language use on the one side need to be connected with technical affordances on the other. The ensuing communication environment has been called communication “mode” (Herring, 2001), to distinguish it from communication “medium,” which is characterized instead by the technology used.

Positioning a medium along the synchronous–asynchronous dimension is a common way to capture some of its technical affordances for communication. In the case of SMS, the medium allows an asynchronous exchange, since the communicants are not expected to be copresent at the same time on the mediated environment. However, confirming that the medium does not determine the usage but only affords it, SMS can also be used in quasi-synchronous exchanges, with a very short or negligible delay between a message and its reply. Other dimensions that capture the affordances of a medium refer to the communication modality: the orality–writing dichotomy is one of them; SMSs have the immediacy and informality of oral communication, most of the time, even though they are less ephemeral than an oral exchange because they are stored in the cell phone and can be retrieved at ease. But the adoption of an informal register varies according to gender and age (Ling, 2004), as will be discussed in the next section, as well as to the contingencies of each specific exchange. More specific kinds of affordance will be considered

in the following sections, while addressing three aspects of SMS usage: its language, its functions, and its structure.

The Language of SMS

Not only popular discourse, but also scientific studies of SMSs are concerned with the lexicon and the composition of these short messages. Regarding lexicon, attention has been paid to simplifications such as abbreviations (i.e., “Fri” for “Friday”), acronyms, contractions (i.e., “Gd” for “good”), clippings (i.e., “hav” for “have”), initialism (i.e., “t” for “the”) (Thurlow, 2003) and to emoticons, namely special configurations of characters that are typed sequentially in order to create a symbol or a figure (called “emoticons” since they express the emotional connotation of a message). In addition, emphasis has been put on the length and complexity of the words used; to the specific topics indexed by the words used; and to informal spelling (unconventional spelling such as “nite” for “night” or “afta” for “after”; g-clippings such as “goin”; letter/number homophones such as “2” for “to”). Regarding composition, attention was paid to message complexity (number of sentences); the usage of punctuation and capitalization; the use of openings and closings.

Both lexicon and composition are connected to sociodemographic categories, since they can vary with age, gender, or nationality. Thus, women are found to send longer messages than men in contexts as different as exchanges between friends in Norway (Ling, 2004) or TV shows in Italy (Herring & Zelenkauskaitė, 2009). Younger users are more likely to use abbreviations, while capitalization at the beginning of a sentence or with names and punctuation is mostly used by young adults (Ling, 2004). This variation testifies that the medium *per se* cannot determine the kind of language used. The medium offers some affordance/constraints (Hard af Segerstad, 2002), which are exploited by the specific communication practices developed by the community of usage.

In the case of lexicon and composition, the practices observed adapt to technical constraints. One main technical constraint is that each message has a size limit, although this limit has extended over the years since the original 160 characters, and varies with the phone model. Another constraint is the inputting system, which is awkward since it requires pressing each letter, one by one, on the small phone keyboard (attempts at overcoming this limit have been made through predictive software that guesses the complete word out of the initial characters inputted, but still the writing of long messages is not encouraged). The use of abbreviations, then, reflects these constraints, and allows one to avoid some of the paraphernalia of the oral encounter (Rettie, 2007).

In order to have a realistic idea of the nature of SMS language, however, some commonplace assumptions need to be dispensed with. The representation of this language seems to dwell more on its unconventionality and discontinuity with respect to nonmediated discourse than is actually the case. First, studies on SMS tend to insist on users’ recourse to emoticons. The peculiarity of emoticons notwithstanding, it seems that the resort to them—as well as to shortenings—is overestimated with respect to the actual usage in SMS and is not an exclusivity of SMS but can be found in other communication modes (Thurlow, 2003; Ling, 2004; Spagnolli & Gamberini, 2007). Second, teenagers are overrepresented in the studies of SMS language, possibly leading to an overemphasis of certain communication practices that adults may not like to adopt (see above for some instances of linguistic variation connected to age). Third, complaints are frequently made that the abbreviations and informalities used in SMS are likely to compromise the development of proper linguistic skills in young users and to impoverish language in general if they are regularly adopted in a linguistic community. However, there is scientific evidence that mastering SMS language contributes to defining and improving overall literacy skills (Plester & Wood,

2009); also, a message can be designed with accuracy, even if it contains shortenings, since the words are carefully chosen and “strategies of self-presentation and linguistic play” are implemented (Ling, 2004, p. 151).

In addition, there is a latent criticism of the quality of SMS communication, reflecting a theoretical position according to which—in brief—media vary in their “bandwidth,” namely in the number of cues that support the communication process and the social identification of the communicants (reduced social cues theory, by Sproull & Kiesler, 1986; and media richness theory, by Daft & Lengel, 1984). Textual communication is extremely limited and poor from this perspective, especially in providing expressive connotations and social cues. The success of SMS in friendship maintenance (see next section), however, contradicts this prediction. In fact, several predictions of the bandwidth hypothesis have failed to be confirmed (Whittaker, 2002), probably because they take face-to-face as the ideal medium for any communication needs, and root the richness of a certain medium only on its technical properties.

To sum up, people use a plethora of different media to communicate (Licoppe & Smoreda, 2006), and consider each of them appropriate to specific circumstances. SMSs are attributed some pragmatic functions that also motivate the particular language used. The next section deals with these functions.

Types of SMS Usage

The types of SMS usage described here also represent the main reasons why people would turn to this medium to communicate. Given the focus on the pragmatics of SMS communication, and then the interest in discussing the usage of this communication mode, the present description will rely on studies that are based on the analysis of SMS; it will not consider theoretical essays, anecdotal reflections, or studies based on participants’ self-reported communication behavior through focus groups, surveys, or journals.

A rough idea of the reasons for preferring SMSs over other modes of personal communication emerges from the list of the topics that are most often found in SMS exchanges. Researchers have repeatedly found that SMSs are used to chat, arrange meetings, share experiences or events, and—to a lesser degree—make jokes and participate in message chains (Grinter & Eldridge, 2003; Thurlow, 2003; Ling, 2004). These topics show when it is considered appropriate to communicate with somebody via an SMS. More specifically:

- SMSs are used as notes to inform the receiver about something that allows him/her to pursue a certain course of action or fix a course of action that was not properly completed. These SMS are usually single messages, that is, they do not expect a response (Grinter & Eldridge, 2003) but serve as reminders or explanations for actions such as being late or not answering the phone. This is possible because SMSs are “easy to send, always received, and regularly checked” (Grinter & Eldridge, 2003, p. 444), which is not the case for other communication modes that require the simultaneous availability of the communicants and are not connected to a personal medium that users always carry with them.
- SMS allows friendship maintenance thanks to “high transportability (more so than email), reasonable affordability (more so than email), good adaptability (e.g. also voice-phone) (. . .) and general suitability (e.g. it is quiet, discrete)” (Thurlow, 2003, p. 15). Friendship maintenance means that people can share their experiences, and be present in a friend’s life sometimes as soon as an event happens, regardless of physical distance between communicants; this contributes to a sense of intimacy even where participants have no visual or acoustic access to each other. A peculiar way of using SMS socially

is the co-reading of SMSs observed in teenagers (Taylor & Harper, 2002; Ling, 2004 p. 153); if this usage happens frequently, then it can be assumed that this possibility also affects the message composition.

- SMSs are used to fine-tune arrangements (Thurlow, 2003; Ling, 2004); they are used not only to plan meetings, but also to give last-minute updates, since the other person is reachable wherever she or he is thanks to the mobile phone.

In most of these usages, SMSs are exchanged with a restricted circle of known people (Grinter & Eldridge, 2003; Cui, 2007; Spagnolli & Gamberini, 2007): reaching somebody wherever they are, with a short text requiring mutual knowledge to be appreciated without sounding impolite, and getting straight to the point without greetings and closures would hardly be appropriate with strangers or acquaintances. The exception is represented by greetings exchanged via SMS: they are longer, include a signature, and are not sent to the same restricted “circle” of people with which SMSs are exchanged daily (Cui, 2007). They are more convenient than greetings cards if the sender resorts to templates to compose them and sends them to a group managed through the contact list of the mobile phone. Finally, SMS is used for romantic or sexual communication (Ling, 2004), although this is less well documented because of the sensitivity of the topic.

The next section will look more closely at SMS usage by considering specific communication practices characterizing this mode.

Structural Practices

Characteristics such as intimacy, individualization, or informality, which are attributed to the communication mode mediated by SMS, are achieved not just through semantic and syntactic choices in the message composition, but also through specific practices building single messages and message sequences.

Ethnographic case studies have highlighted the existence of social norms affecting the way in which an SMS exchange is produced (Taylor & Harper, 2002; Grinter & Eldridge, 2003; Tamminen, Oulasvirta, Toiskallio, & Kankainen, 2004). For instance, resorting to SMS is encouraged in circumstances that would make other communication modes unviable, such as in class or at night; participation management and context maintenance are required to handle the intersection with other activities with which communicants are engaged during an SMS exchange; and negotiations allow the user to switch from SMS to other media.

When it comes to the detailed practices through which an SMS exchange is built and relevant social norms are implemented, a systematic analysis of collections of complete SMS exchanges is needed. So far, published works carrying out this kind of analysis have highlighted that SMSs are most often part of a sequence of messages rather than single messages (Grinter & Eldridge, 2003; Spagnolli & Gamberini, 2007). Receiving a reply to an SMS depends partly on the recipient’s willingness to do so, but partly also on some features that make the reply more or less relevant, such as the kind of action produced through the message—for example, greetings (Cui, 2007) or “sticky notes” (Grinter & Eldridge, 2003) are often single messages.

Probably the most frequently reported practice is the absence of utterances through which the message (Ling, 2005) or, more properly, an SMS exchange (Spagnolli & Gamberini, 2007) is opened and closed. Therefore when openings and closings are present, they represent a marked way of starting or ending the encounter, for example emphasizing the mutual presence on the venue after a long period without communicating.

Finally, another structural characteristic of an SMS exchange is its length, which seems connected to the actions performed in the messages. From this point of view, SMS sequences are pragmatically coherent, since actions started in one message (e.g., questions, information) are usually replied to in a message sent by the receiver (e.g., answer) in what constitutes an “adjacency pair” according to conversation analysis (Schegloff, 2007). Even when actions seem not to get a reply *prima facie*, “this is because they are actions topically or pragmatically connected to actions that receive a reply; actions replied via one ‘ring’ or actions replied implicitly” (Spagnolli & Gamberini, 2007, p. 352). The length of an SMS sequence is also dependent on the total number of messages exchanged, which is usually symmetric between communicants (Spagnolli & Gamberini, 2007); this can be read as a social norm favoring reciprocity in the exchanges (Taylor & Harper, 2002).

Conclusions

According to the studies published so far, SMS represents a communication mode that is selected among the repertoires of media available when the exchange needs to be private, informal, convenient, short, and intimate. In addition, some detailed observations of the structure of SMS exchanges have shown their pragmatic coherence and their compliance with a social norm of reciprocity. The pragmatics of SMS communication can be understood by paying attention to the practices through which the whole SMS exchange is built, as well as to the way in which these practices adapt to the possibilities of the medium (e.g., asynchronicity, one-to-one relations with people on a contact list, textuality, limited size, constant availability, individualization of the tool) and the contingency of the situation.

Pragmatics of Stance

PENTTI HADDINGTON

Introduction

“Pragmatics” is here understood broadly as the study of how language and talk are used in discourse and how their use is influenced by nonlinguistic factors. “Stance” refers to the ways in which speakers talk and use language to express different kinds of positions, attitudes, and feelings. Taking a stance in speech or in writing is a predominant and multifaceted feature of language use and it has been studied broadly.

Pragmatic research on the expressions of stance can be placed on a “subjective–intersubjective” continuum. At the subjective end of the continuum, the act of taking a stance can be understood as the way in which speakers or writers express their position toward an entity or a proposition. At the more intersubjective end of the continuum, taking or adopting a position is seen as an intersubjective achievement. Individual studies on this “subjective–intersubjective” continuum should not be seen as being mutually exclusive or contradicting each other. Rather, they both provide a rich view of how speakers use language to express their attitudes and to adopt positions in discourse. Still, “stance” is not an unproblematic notion.

Subjective Stance

A large body of research in pragmatics has shown that speakers and writers use various linguistic forms (units, phrases, and words) to express their stance either toward a subsequent proposition in an utterance or toward some entity or referent (see Thompson & Hunston, 2000). In general, this body of research understands stance as a subjective attitude which rises from the speaker’s internal mental positions, aims, and beliefs. Linguistic forms are then seen to represent the language user’s *subjective* (also *internal*, *individual*) stance.

Research has especially focused on linguistic forms that express a speaker’s or writer’s evidential, evaluative, epistemic, or emotional stance. Linguistic *evidentials* (e.g., adverbs, modals, and verbs) can be used for evaluating the degree of reliability of knowledge or for specifying the mode of knowledge (see Chafe, 1986, and below). Speakers and writers also frequently *evaluate* other people, objects, or events by using, for example, adjectives (“That is *nice*.”) (see Channel, 2000). *Epistemic* expressions are used to display the speaker’s degree of knowledge or belief (e.g., “*I think* she was here,” “*I know* she was here,” “*I don’t know* if she was here.”) Finally, *emotional* expressions refer to linguistic elements by which speakers express their feelings and emotions, such as joy, sadness, and anger (e.g., “*I’m sad* and *angry*.”) (Martin, 2000).

There are several linguistic frameworks which have approached stance from this perspective. Influential and extensive research in the *appraisal framework* within systemic functional linguistics has explained how attitudinal and evaluative meanings are expressed in discourse, especially through evaluative words (Martin, 2000). *Corpus linguistic* research has shown that a large number of linguistic forms that are very frequent in discourse are used for expressing a personal attitude or feeling. Using the Longman Spoken and Written

English Corpus (LSWE), Biber, Johansson, Leech, Conrad, and Finegan (1999) have studied the occurrences and frequencies of adverbs, verbs, adverbials, and modal markers and shown that they frequently function as ways to express stance in discourse. Channel (2000) uses corpus linguistics as a method for studying how words and phrases receive negative evaluative meanings as a result of their frequent use in particular collocational contexts.

Discourse-functional linguistics, which usually relies on recorded data (audio or video) of spoken discourse, has focused for example on the expressions of evidential stance in discourse. In one study, Chafe (1986) has shown how speakers express different degrees of evidentiality (reliability, belief, induction, sensory evidence, hearsay evidence, deduction, and expectation) linguistically with adverbs, modals, and verbs. Downing (2001), by using the British National Corpus, focuses specifically on the adverb *surely* and shows how it displays the speaker's confidence toward the truthfulness and reliability of the subsequent claim. There is also recent research in discourse-functional linguistics which shows how particular frequently occurring and grammaticized linguistic markers are used to display speaker stance toward a proposition encoded in the following utterance. These studies have focused, for example, on such epistemic, evidential, and evaluative stance markers as *I think* (Kärkkäinen, 2003), *I don't know* (Scheibman, 2000), and *I guess* (Kärkkäinen, 2007). (See also Thompson, 2002.)

The two main arguments in the above studies have been that first, speakers and writers have a wide array of linguistic resources available to them for expressing their attitudes and opinions, and second, that these resources express the *speaker's subjective stance*. Nevertheless, many of these studies acknowledge that the studied linguistic forms do not only express a subjective position or an attitude toward a subsequent clause, sentence, or utterance, but that they emerge in the situated social context and can also be used for constructing agreement and affiliation, for displaying disagreement and conflict with prior discourse or between speakers (e.g., Chafe, 1986; Kärkkäinen, 2006), or for constructing and maintaining relationships between speakers and hearers (Hunston, 2007). In other words, these linguistic resources can be used for the intersubjective and dialogical expression of stance.

Intersubjective Stance

How do people use language to communicate their stances to each other in spoken discourse? What are the linguistic and interactional mechanisms that they rely upon in order to agree or disagree with a position taken by a coconversationalist? This question has been asked in a broad, more interactionally oriented line of pragmatic research. Within this framework, it is possible to identify three different approaches to talk and language. First, there is *discourse-functional* (see above) research that focuses more on how morpho-syntactic, prosodic and lexical practices are used for taking a stance in dialogic interaction (Du Bois, 2007). Second, in *conversation analysis* there is research that focuses on how speakers through the production of situated social actions adopt and understand positions in sequentially unfolding interaction. Third, *interactional linguistics*, which is informed by the conversation analytic method, specifically focuses on how linguistic forms feature in the design of social actions.

What is common to these approaches is that they rely on audio or audio-video recordings of naturally occurring spoken discourse and microdetailed transcriptions made of them. As regards "stance" specifically, they also build upon the idea that speakers use language to negotiate their positions in spoken discourse with and relative to other participants in the conversation and what they have said. They argue that speakers use different linguistic forms and practices—not only to display their stance toward a subsequent utterance or

proposition, but also to agree and disagree, to affiliate and disaffiliate with other speakers; to adopt positions with respect to topics and themes, events, objects and themselves in spoken discourse; to modify their stances; and to design them with respect to immediately prior talk.

These studies show how linguistic structures and practices are used for the intersubjective construction of stance in two ways: (a) stances can be taken and designed on the basis of and as responses to previous talk, and (b) stances can be constructed for particular recipients. Thus, the general objective is to study how particular linguistic constructions and interactional practices are used for collaborative and intersubjective stance taking. That is, whatever positions we take, the positions are not left hanging in the air; they are not produced in a vacuum. Rather, they are made socially available for coconversationalists; they can be agreed upon, contested, disagreed with, left uncommented, and so forth.

There are a few studies that have taken this broad theoretical starting point. One of these is Du Bois's (2007) *discourse-functional* work on stance taking. Du Bois outlines "stance" as follows: "Stance can be approached as a linguistically articulated form of social action whose meaning is to be construed within the broader scope of language, interaction and sociocultural value" (Du Bois, 2007, p. 140). Furthermore, Du Bois sees stance taking as a tri-act in which speakers take stances about (and position themselves with respect to) an object of talk; at the same time, speakers negotiate their positions and attitudes relative to one another (and align themselves with respect to one another). The use of particular linguistic structures can also invoke and index different sociocultural values, which further position the speaker with respect to objects and other speakers. For discourse-functional linguistics, and perhaps for traditional linguistics more broadly as well, Du Bois' (2007) contribution has been to show that linguistic stance taking is an intersubjective social act and that language form and its indexical properties within the sequential, sociocognitive, and cultural context are important resources for constructing and understanding stances in spoken discourse. By building on the framework outlined by Du Bois (2007), Haddington (2006a) shows how in a news interview an ethnic identity comes to be presented in a dubious light, not through individual utterances or linguistic forms but gradually in and through sequentially unfolding discussion. With the same background, Kärkkäinen (2006) studies story completions and shows how the tellers, by using for example assessments, encourage story recipients to partake in the evaluation of the story. Consequently, she shows how a stance toward a just-prior story is jointly accomplished in a story-reception sequence (see also Kärkkäinen, 2007).

Prominent research in *interactional linguistics* has also explored how interlocutors use linguistic structures as part of social action to adopt positions with respect to their coconversationalists. Keisanen (2006) studies tag questions and negative yes/no interrogatives and how they are used in American English conversations in such actions as requests for confirmation, challenges, disagreements, and assessments for negotiating evaluative, affective and epistemic positions. Haddington (2007) describes a linguistic practice called the NEG + POS pattern by which interviewees in televised news interviews deny the relevance of the question or a presupposition in it and then respond to the question in their own terms. Halonen and Sorjonen (2008) show how interrogatives in Finnish are used for calling into question a prior action. Steensig and Larsen (2008) study the affiliative and disaffiliative uses of questions in Danish. Rauniomaa (2007) studies Finnish stance markers *minusta* (i.e., I think) and *minun mielestä* (i.e., in my opinion, to my mind, it seems to me) as they are used in assessments. In another study, Rauniomaa (2008) focuses on repetition and shows that by repeating a linguistic form, a speaker takes a stance—not to a person, object, or subsequent utterance, but toward the ongoing activity or another speaker's (lack of) contribution in just-prior talk.

In addition to linguistic pragmatic research on stance, there are plenty of studies that take social action, sequence, or turn construction—rather than a linguistic form or practice—as their starting point and study how social actions in their sequential contexts are designed and used for adopting and negotiating positions. This work in *conversation analysis* has studied, for example, agreements and disagreements (Heritage & Raymond, 2005), questions (Koshik, 2002), challenges (Keisanen, 2007), and responses (Gardner, 2001). A classic paper among these is Pomerantz's (1984) study on assessments. She shows that the production of assessments in talk is a highly routinized, constrained, and organized sequential activity. She continues by claiming that by producing an assessment, participants partake in a social activity in which they first introduce a referent of which they have direct knowledge and then produce an assessment of it. Furthermore, assessments tend to be sequentially organized into first assessments and second assessments. A first assessment often prefaces and is followed by a coparticipant's second assessment, in which she reports either an agreeing or a disagreeing stance about the referent introduced by the first speaker. It is noteworthy that the way in which the first assessment is designed invites either a preferred or a dispreferred second assessment. More recently, conversation analytic research has also started to study how nonverbal practices (e.g., gestures and gaze) are used as resources for taking a stance (e.g., Haddington, 2006b; Stivers, 2008).

Finally, there are also conversation analytic studies that focus specifically on the use of prosody for expressing stance. Niemelä (2005), who studies direct-reported speech (DRS) in storytelling sequences, shows how prosodically voiced DRS in stories is often followed by matching voiced direct reported speech produced by story recipients (either in responses to stories or in second stories). According to Niemelä, such matching voiced DRS functions as a display of an affiliative stance. In two important papers, Ogden (2006) and Local and Walker (2008) show that particular phonetic features cannot be connected to specific displays of affect, emotions, or stance (e.g., sadness, joy, anger). In the first one, Ogden (2006) shows that agreements and disagreements do not have any unique phonetic properties. Rather, the phonetic devices which speakers use are related to the action that the turn produces in its sequential context. Ogden (2006) continues by describing a phonetic pattern in which a preferred second assessment is phonetically “upgraded,” whereas a dispreferred second assessment is “downgraded.” In line with Ogden's work, Local and Walker (2008) show how expressions of stance and affect cannot unproblematically be connected to particular phonetic features of talk; they argue that stance and affect are understood as part of the turn and sequence in which they occur.

Discussion

“Stance” is not an unproblematic analytic notion for pragmatics, and there are at least two reasons for this. First, as has been outlined above, “stance” is used broadly to refer to very different kinds of linguistic, cognitive, and social phenomena. It has been used as a near-synonym or even an umbrella term for such notions as “affect,” “emotion,” “evidentiality,” “epistemicity,” and “evaluation.” It has also been used as an analytic notion to cover such acts as evaluating people, objects, and events, and negotiating social positions and attitudes in discourse. Consequently, rather than being a clearly conceptualized notion that refers to a specific phenomenon, its broadness can be confusing. Second, in linguistics “stance” is an analyst's category that continues to be connected to different linguistic practices but which does not explain how or for what purposes a linguistic practice is used in discourse. An analyst should be able to say more than simply that a linguistic practice “expresses a stance.”

While these points remain partly unanswered, it should be noted that pragmatic research on stance and stance taking has been valuable and helpful—especially for linguists in

that it has supplemented existing linguistic research by foregrounding the idea and by providing evidence that linguistic forms have social functions in discourse. Furthermore, some of the above studies have helped linguists to recognize the importance of studying how humans use language in real everyday conversations. Thus, they can be helpful in highlighting the importance of understanding the intersubjectivity, reflexivity, and dialogicality of language use, and thereby supplementing existing knowledge of language and linguistic form.

In the future, it would be valuable to combine different linguistic methods, for example interactional linguistics, cognitive linguistics, and corpus linguistics, in order to obtain a comprehensive view of how speakers and writers use linguistic forms to adopt positions in discourse. Such a study would enhance our knowledge by exploring the degree to which expressing one's position and attitude, or taking a stance, is a multifaceted linguistic-interactional phenomenon.

Pragmatics Research Methods

ANDREA GOLATO AND PETER GOLATO

As the entries in this encyclopedia demonstrate, there are a number of theoretical approaches to the study of pragmatics, or language use. And similarly, there are a number of different research methods, that is, data collection techniques and subsequent data analysis procedures. Given that various theoretical approaches employ similar data collection and data analysis procedures, this entry is not organized by theoretical approach but by research methods. The reader should note that there is no intrinsically “best” or “ideal” research method per se for the study of pragmatics. Instead, different research questions within the field of pragmatics call for different research methods; that is, if one is interested in speaker intuitions, one will need to employ different data collection and data analysis procedures than if one is interested in actual language use.

The research methods described here are used not only in native speaker pragmatics research, but also in cross-cultural pragmatics (i.e., research comparing speech events across languages) and in research on the acquisition of pragmatics (or developmental pragmatics, that is, research on the development of pragmatic comprehension by children, as well as on speech events produced, understood, or both produced and understood by adult learners of a second language).

The entry is structured as follows. We first discuss data collection procedures, categorizing them into observational, elicited, and experimental collection procedures. For each procedure, we briefly explain how researchers proceed in order to collect the data and mention some of the advantages and disadvantages of each method. We then describe the types of analyses that can be done on the different types of data collected. These types of analyses fall into either qualitative or quantitative analysis paradigms.

Before embarking on a research project, the researcher needs to comply with their country's and their institution's rules and regulations concerning research with human subjects. In many countries, data collection without the participants' knowledge and informed consent is illegal.

Observational Data Collection Procedures

Observational data collection procedures are those in which the researcher simply records interactions in real-life settings without influencing what is to be recorded, for instance, without setting up the encounter, without asking participants to behave in any particular way, and so forth. Such data are also called naturally occurring data. As a clarification of what counts as naturally occurring data, Potter (2002; 2004) suggests what he terms the

(conceptual) dead social scientist's test—would the data be the same, or be there at all, if the researcher got run over on the way to work? An interview would not take place without the researcher there to ask the questions; a counselling session would take place whether the researcher turns up to collect the recording or not. (Potter, 2002, p. 541)

Such data can be captured in a variety of different ways. Researchers can either audio record or video record naturally occurring data; they simply set up and turn on the recording

equipment, and then leave the recording site in order to have minimalistic impact on the interactants. Typically, telephone interactions are audio recorded. When the participants in the interaction have visual contact with each other, video recording can be chosen in order for the researchers to have the same access to the interaction as the participants. However, depending on the recording site, it might not be feasible to record a video and hence audio recording might be the only possible way to capture any data at all. This can happen if one is recording in a factory/company setting where industry secrets might be at stake, when subjects do not consent to being video recorded, and so forth. With this form of data collection, researchers collect not only specific target phenomena, for example, compliments or requests, but the entire interaction. On the one hand, this is a disadvantage as potentially large amounts of data need to be collected in order to have enough instances of a given phenomenon for analysis. On the other hand, the data collected for one specific project might be reused when investigating a different phenomenon (provided that subjects have given their consent for reuse of the data).

Field observations are another observational data collection procedure. Here, researchers are at the research site either as observers or as observing participants. Whenever the speech event under investigation is uttered, the researcher writes it down immediately while also taking notes on the contextual features of the utterance, such as who uttered it, when it occurred in the interaction, how it was uttered, and so forth. At times, a researcher interested in a particular phenomenon trains various data collection assistants and sends them out into the field, which results in quicker collection of greater quantities of data. In contrast to audio- or video-recorded interaction, the researcher only has direct access to the interaction once, and afterward has to rely on the field notes. With field observations, the data cannot be replayed or re-examined.

Researchers interested in pragmatic features of online communication or written communication in general can use as their data sources written, electronic, or both written and electronic corpora which they either compile themselves (by accessing Web chats or other computer-mediated communications, blogs, Google, newspaper archives, etc.) or which have been compiled by various organizations or institutions (for a list of existing corpora, see <http://linguistlist.org/sp/Texts.html>).

Elicited Data Collection Procedures

As the name suggests, in elicited data collection procedures the researcher exerts varying amounts of control over the data to be gathered. That is, typically, the interactions are happening for the sole purpose of the research project and subjects are performing speech events under conditions predetermined by the researcher.

A number of researchers also use interviews in which they either elicit personal narratives or commonly known stories from subjects, have subjects describe various pictures, or have them tell a picture story. Topics are selected such that the telling will include the speech event, variable, or grammatical feature under investigation. In a strict sense, personal narratives could also have been described under observational data as the researcher is typically only providing the topic and asking follow-up content questions. Some researchers, particularly those conducting ethnographic work, play back interviews (specifically personal narratives) to other subjects asking them to comment on various features of the interaction or narrative. The researcher can then use these third-party testimonies as support for his or her analysis of the narrative or narrative pattern (e.g., Koven, 2007). Interviews can also take the form of recall protocols in which the interviewer asks the subjects to remember the last time they participated in a particular speech event (for example, a complaint or a compliment) and to describe in detail the context of the interaction, including what was

said and what the response was. This method allows for the rapid collection of very specific speech events from a variety of interactants and contexts; however, the researcher has to rely on the account by the informant and has no independent way of checking the accuracy of the account.

Role plays are very frequently used in research on cross-cultural and developmental pragmatics as they allow the researcher to control for a number of variables (e.g., the number and gender of speakers, contextual features, etc.) such that the main variable under investigation is exclusively the realization of the same speech event in two different languages or with adults and children. In role plays, researchers put subjects into pairs or small groups, in which each speaker is given a role card which describes in detail the interaction they are supposed to perform with the other subjects. In order to increase the authenticity of the interaction, it is generally recommended that subjects perform roles with which they are familiar in real life. However, research has shown that imagined roles and real-life roles still interfere (Wildner-Bassett, 1989; Kasper & Dahl, 1991). Role plays have an advantage in that they closely represent oral production, for instance, they contain turn-taking features, hesitations, silences, and negotiation of meaning just as nonelicited data do (Kasper & Dahl, 1991); however, they are still driven by the interests of the researcher and thus do not always allow for the same free topic or action development (Kasper, 2000). In order to prevent stilted interactions, it is typically recommended that researchers pair up role players who know each other. In some role-play scenarios, the cards contain instructions to perform the specific speech event under investigation (e.g., “when appropriate in the interaction, pay your partner a compliment”). In order not to unduly influence the role players, researchers have recently begun to include specific instructions on only one of the role cards such that the other participants are unaware of the purpose of the role play. At times, it is possible to create role-play scenarios in which it is not obvious to the role players which speech event is under study.

Discourse completion tasks and production questionnaires are yet another very frequently used form of data elicitation, particularly in cross-cultural and developmental pragmatics research. Here, subjects are presented with a situation to which they have to respond. The situation is designed such that the speech event under investigation is believed to be the next action (e.g., “Your friend has offered you a piece of gum, and you say: _____.”). Discourse completion tasks vary in terms of the amount of contextual information they provide, whether responses are written down or audio recorded, and whether the next line of talk of the prior speaker is included in the scenario. In general, subjects are presented with 4–10 similar scenarios all targeting the same or similar speech event. Again, discourse completion tasks afford administrative advantages and do not require time-consuming transcriptions (Billmyer & Varghese, 2000). They seem, however, to primarily tap speaker intuitions as they are metapragmatic in nature (i.e., they do not require subjects to actually interact, but do require subjects to reflect upon interaction), and research suggests that these forms of elicitation yield data which differ from observational data and actual language use (Golato, 2003).

Experimental Collection Procedures

These are procedures in which subjects perform tasks in the context of experiments which yield data primarily in the form of reaction times, usually measured to the millisecond. In contrast to observational and elicited data collection procedures, experimental collection procedures typically do not involve subjects producing or understanding either naturally occurring or elicited speech events. Instead, they involve subjects performing a task which requires them to make a response, classically a decision or a judgment about a visually or

auditorily presented language-oriented item, though many such studies feature timed reading tasks (e.g., self-paced reading) and other less consciously controlled measures (e.g., eye tracking). The items themselves bear linguistic characteristics which by design are of interest to the experimenter. Items are usually presented under carefully controlled conditions and include test, control, and distracter items. Thus, the data from such collection procedures consist of subjects' responses to language-oriented items presented under contrasting experimental conditions. Considered together with subject-related biographical (e.g., age, sex) and experiential variables (e.g., native language, additional language(s), time spent on study abroad, etc.), the data are used to make inferences about how the subjects processed the items in real time.

To take one example, a researcher might design an experiment in which adult subjects were asked to decide whether a test sentence containing a scalar or quantity implicature such as "some dogs are canines" was true or false. Depending on their reading, such sentences are held to be both true (i.e., some, and possibly all dogs are canines) and false (i.e., some, but not all dogs are canines). Control sentences in the experiment might include "some canines are dogs," "all dogs are canines," and "all canines are dogs." The time subjects take to answer "true" or "false" is recorded for each sentence. One recent study (Bott & Noveck, 2004) found that among other things, subjects take significantly longer to respond to test sentences when told to interpret *some* as meaning *some but not all* than when they are told to interpret *some* as meaning *some and possibly all*.

Generally, in experiments such as these, faster response times will occur when subjects are responding to structures which are thought to be less ambiguous, which they have previously encountered with some measure of frequency (e.g., lexical frequency as determined through large corpora), which are by some measure hypothesized to be expected (e.g., they involve co-occurrence, are grammatical, etc.), or all of the aforementioned. Slower responses occur when subjects are presented with structures which are ambiguous, occur less frequently, or which are by some measure hypothesized to be unexpected, or all of these. Thus, experiments of this kind can allow researchers to infer when learning has occurred. In addition, they can be used to investigate empirically the relative efficacy of different theoretical accounts of pragmatics (e.g., Bott & Noveck, 2004).

The features of experimental collection procedures which make them ideal for examining real-time language processing are the same ones which make them less than ideal for examining real-time interaction. To date, the constructs typically under study in work on experimental pragmatics have been very different than those under study in other areas of research on pragmatics.

Data Analysis

Once the data have been gathered, researchers typically transcribe their audio or video recordings. The different approaches to discourse have different transcription conventions that vary in terms of the detail with which the spoken language is rendered in writing. For instance, in some approaches only actual words are noted; in others, silences are marked with a symbol; in yet others, silences are timed. Which transcription convention one chooses ought to depend on the nature of the research question and the theoretical framework in which one works. Regardless of the transcription convention, most researchers consider the actual recording as their primary data and any transcript as a supportive tool for the analysis. In terms of the actual analysis of the recorded data, different theoretical approaches have varying foci. In conversation analysis and interactional linguistics, for instance, researchers investigate actions as they are accomplished through linguistic practices; here, analytic claims are made based on the interactants' (not the researcher's)

orientations to prior and upcoming turns. In certain discourse analytic approaches, the coparticipants' orientations take a subordinate role to the analyst's interpretation of the action. In some areas of discourse analysis (such as text analysis, or functionalist linguistics) grammatical features and devices are analyzed for their function in discourse. And researchers working in sociolinguistics, in certain approaches within discourse analysis, and in ethnography, all use the data both in terms of its content and its formal features to analyze various variables such as age, gender, language background, power, race, and so forth. Depending on the nature of the research questions, the analyses are either primarily descriptive in nature, or they employ descriptive statistics and correlations. Yet others make arguments based on both descriptive and inferential statistics.

Researchers interested in cross-cultural pragmatic analyses or developmental pragmatics often use data gathered through observational or elicited collection procedures from two groups or at two different points in time, and then compare these two sets of data. For instance, a researcher interested in describing cultural differences in apology design might compare how apologies are done by native speakers of English and by native speakers of Spanish; alternatively, researchers might compare how Chinese-speaking learners of English realize requests in English before and after having been taught English request patterns. Depending on the research question, the researcher may simply provide a descriptive account or else employ statistical procedures to compare the data sets. Data gathered through real-time processing experiments are always analyzed using both descriptive and inferential statistics.

This entry has provided an overview of the manifold data collection and data analysis procedures used in the field of pragmatics. To reiterate, there is no single best or optimal methodology for conducting research in pragmatics. The research question under investigation should guide the researcher's decision concerning the choice of data collection and analysis procedures. Not surprisingly, advances in newer forms of communication (e.g., cell phones, discussion boards, text messaging, and other forms of synchronous or asynchronous forms of communication) continue to lead to new and exciting developments in the way pragmatics research is conducted and the questions that it investigates.

Pragmatics: Overview

MARTA GONZÁLEZ-LLORET

Pragmatics may be defined as “the study of language use” (Levinson, 1983, p. 5); however, such a simple definition hardly reveals what the field really encompasses and it may be more productive to describe the range of phenomena studied within the domain of pragmatics (Levinson, 1983). Such a description would have been easier to develop 30 years ago than it is now, since the boundaries of the area of pragmatics have grown to intersect with disciplines such as linguistics, sociology, discourse analysis, conversation analysis, philosophy of language, anthropology, cognitive psychology, human–computer communication, computer-mediated communication, bilingual/multilingualism, ethnography of communication, and first and second language acquisition.

In general, pragmatics is concerned with the study of meaning as communicated (verbally, nonverbally, and with silence) by the speaker and interpreted by the listener. Research is undertaken by considering how the message is organized, what the context of the message is, who the speakers are, and what their relationship is. As defined by David Crystal, pragmatics is

The study of language from the point of view of users, especially of the choices they make, the constraints they encounter in using language in social interaction and the effects their use of language has on other participants in the act of communication. (Crystal, 1997, p. 301)

The definition of pragmatics, and the area itself, has evolved through the years, with shifting research emphases. The following historical overview, far from being exhaustive, attempts to provide the reader with an idea of the main topics and trends that shaped pragmatics into what it is today.

Historical Overview

The term “pragmatics” surfaced in the United States in the late 1930s. In 1938, Charles W. Morris, a philosophy professor at the University of Chicago, proposed pragmatics as part of a semiotic theory (theory of signs) which studied signs in terms of their relations to (a) objects (semantics), (b) each other (syntactics), and (c) people (pragmatics). This idea was further explored by the German philosopher Rudolf Carnap who stated that pragmatics encompassed studies in which reference is made to the speaker, to the user of the language (1955); from this perspective communication was not viewed as an abstract language system, but rather as a system that considered the users engaged in the communication. At the same time in Europe a movement towards a linguistic philosophy that promoted the study of ordinary language in its own right (ordinary language philosophy) was gaining interest. Its main exponent, Ludwig Wittgenstein (1953) proposed speaking as a changing activity (a “form of life”) dependent on history, culture, and context.

In the late 1960s, as a break from Chomsky’s transformational grammar, generative semantics (e.g., Ross, 1970) emerged as a branch of linguistics with a special interest in including pragmatic phenomena as part of semantics within a grammatical theory. Generative

2 PRAGMATICS: OVERVIEW

semantics was largely influenced by philosophers of language such as J. L. AUSTIN (1962), John SEARLE (1969), and H. Paul Grice (1975), who put forward some of the most basic principles of pragmatics, which have been adopted, investigated, revised, and challenged up to this day. Among these were three important ideas: first, the idea that language is not just an abstract system to describe a world that can be reduced and captured by truth-conditions; second, the idea that language is a complex system in which the speaker, the hearer, and the context of the message are situational variables that determine meaning (Austin, 1962); and third, the idea that language is used not only to *say* things, but actively to *do* things, that is, the speech act theory (see SPEECH ACTS RESEARCH) initiated by Austin (1962) and later advanced by Searle (1969). Although not without criticism (e.g., Thomas, 1995), speech act theory is one of the most studied topics in pragmatics today.

To Austin's and Searle's ideas, we need to add the very influential notion by Grice that communication is a cooperative action as well as the concept of implicature (see CONVERSATIONAL IMPLICATURE) (Grice, 1975). According to Grice, the meaning of a sentence is different from the speaker's meaning (i.e., not only what is said, but also what is implicated). When inferring the speaker's meaning, the hearer has some expectations that the conversation is a rational and cooperative activity (cooperative principle) and would follow some rules, or rather, conditions for communicating successfully, called maxims, which specify the amount of talk (quantity maxims), the truthiness of the talk (quality maxims), the relevance of what is said (maxim of relation), as well as the clarity of the talk (manner maxims).

These ideas provided a starting point for neo-Griceans such as Atlas (2005) and Levinson (1983) who expanded Grice's idea of rules and principles in communication, as well as for relevance theorists Sperber and Wilson (1986). Based on Grice's idea of implicature, but rejecting the idea of speakers following a group of maxims or behavioral rules, relevance theory emerged as a better foundation for theoretical pragmatics. Dan Sperber and Deirdre Wilson (Wilson & Sperber, 1981; Sperber & Wilson, 1986) proposed that all communication is a process guided by efforts and rewards in which we try to minimize the effort and maximize the rewards. According to Sperber and Wilson, everything we say is relevant or otherwise we would not say it, and the expectation of relevance among speakers is enough to clarify and maintain meaning. Relevance theory is one of the most influential proposals of cognitive pragmatics in the last decades.

Current Research

A large part of pragmatics research today has to do with social and cultural aspects of language including social cognitive research (see PRAGMATICS AND COGNITION), linked to those cognitive views of pragmatics described above. As Verschueren points out pragmatics is an approach to language which "takes into account the full complexity of *its cognitive, social, and cultural* (i.e., '*meaningful*') functioning in the lives of human beings" (Verschueren, 1999, p. 870, italics in original). These social and cultural studies in the area of pragmatics were largely influenced by work in sociology (Goffman, 1955; Brown & Gilman, 1989) and ethnography of communication (Hymes, 1972).

One of the most productive areas of research in pragmatics has been based on the concept of POLITENESS (and face-threatening acts). The work by Lakoff (1973), Leech (1983), BROWN and LEVINSON (1987), and Thomas (1995) has motivated investigations of politeness from multiple perspectives, from purely theoretical to studies of intercultural and CROSS-CULTURAL PRAGMATICS, as well as acquisition of politeness rules by both children and speakers of other languages. This interest in social interaction (see PRAGMATIC SOCIALIZATION), how people use language to communicate their positions and feelings (stance) (see PRAGMATICS OF STANCE), and how speech communities interact (see PRAGMATICS AND

CULTURE), is largely responsible for pragmatic research in languages other than English. The interest in cross-cultural communication (see CROSS-CULTURAL PRAGMATICS) as well as for the well-established study of speech acts, gave birth to the renowned Cross-Cultural Speech Act Realization Project (CCSARP) where researchers such as Shoshana BLUM-KULKA, Claus Faerch, Juliane HOUSE, Gabriele KASPER, Elite Olshtain, Ellen Rintell, Jenny Thomas, Eija Ventola, Helmut Vollmer, and Nessa Wolfson studied two speech acts (requests and apologies) in six languages: Canadian French, Danish, German, Hebrew, Russian, and Australian, American, and British English (Blum-Kulka & Olshtain, 1984). Their studies became the foundation of one of the most fruitful areas of pragmatics today which has extended to languages on all continents (see CARLA for an extended bibliography at www.carla.umn.edu/speechacts/index.html).

Another large subarea in pragmatics has developed parallel to the growth of applied linguistics, second language acquisition, and second language studies. Second language pragmatics examines how speakers of a language other than their own communicate with others either by using a lingua franca (see PRAGMATICS OF LINGUA FRANCA INTERACTION) or another language in a variety of contexts (see PRAGMATIC COMPETENCE IN MULTILINGUAL CONTEXTS). How their cultural and social background (see SOCIETAL PRAGMATICS) as well as their first language (see PRAGMATIC TRANSFER) affects the way they interact, how their pragmatic abilities develop (see INTERLANGUAGE PRAGMATICS and SOCIOCULTURAL THEORY AND INTERLANGUAGE PRAGMATICS), and how this process is affected by instruction either inside (see CLASSROOM RESEARCH ON PRAGMATICS) or outside the classroom (see PRAGMATIC DEVELOPMENT IN STUDY-ABROAD CONTEXTS) through, for example, pragmatic awareness (see PRAGMATIC AWARENESS IN SECOND LANGUAGE LEARNING). As Kasper, Nguyen, and Yoshimi (2010) point out in the introduction to a recent volume of *Pragmatics and Language Learning*, this area has developed in the last 20 years towards a view of pragmatics as “the study of language-mediated social action” (p. 3), moving toward a conceptualization and analysis of pragmatic competence as interactional competence and as the ability to perform social actions in their natural setting.

This move towards an interactional view of pragmatics has its origins at the end of the 20th century. At this time, a movement emerged in favor of a view of pragmatics which focused not only on language as *action*, but as *interaction* (Thomas, 1995; Verschueren, 1999). Most recently, in this same line, Kasper has argued for a *discursive* approach to pragmatics in which meaning and action are constituted not only *in* but *through* social interaction (Kasper, 2006, p. 282). Traditional studies in politeness, identity, speech acts, and so forth, are being explored from an interactionist perspective in which categories are not discourse-external or predetermined but rather achieved locally by the members of the interaction during the interaction (e.g., Locher, 2004).

As part of this interactionist movement and with an important antecedent in Levinson's chapter on conversation analysis in his influential *Pragmatics* (Levinson, 1983), a growing number of researchers in the field are paying attention to the organization of conversation and how interaction is structurally and systematically organized by participants to accomplish everyday social activities. From this empirical approach, researchers are reconceptualizing classic topics in pragmatics such as politeness (e.g., Cook, 2006), speech acts/speech act sequences (see González-Lloret, 2010, for an overview), cross-cultural communication (e.g., Márquez Reiter, 2008), INTERLANGUAGE PRAGMATICS (e.g., Ishida, 2006), and instructed second language pragmatics (e.g., Huth & Taleghani-Nikazm, 2006), in regular conversation as well as institutional interactions (see INSTITUTIONAL PRAGMATICS). In addition to this thrust for the study of naturally occurring data, there is still a strong and fruitful tradition of experimental pragmatics (see SECOND LANGUAGE EXPERIMENTAL PRAGMATICS) that investigates different aspects of pragmatics such as the use and acquisition of routines (see PRAGMATIC ROUTINES), pragmatic strategies (see COHEN, ANDREW D.), the use of corpus

4 PRAGMATICS: OVERVIEW

linguistics in pragmatics (see PRAGMATICS IN LEARNER CORPORA), its intersection with grammatical knowledge (see PRAGMATICS AND GRAMMAR), and best testing practices (see TESTING IN PRAGMATICS RESEARCH), all of these from a variety of approaches and research methods (see PRAGMATICS RESEARCH METHODS).

Finally, the integration of technology into everyday communication has opened new lines of pragmatics investigation into how people engage in interaction that is mediated by technology (see CYBERPRAGMATICS), from email (see PRAGMATICS OF ASYNCHRONOUS COMPUTER-MEDIATED COMMUNICATION) and other mobile devices (see PRAGMATICS OF SHORT MESSAGE SERVICE) to online environments (see SYNTHETIC IMMERSIVE ENVIRONMENTS AND SECOND LANGUAGE PRAGMATIC DEVELOPMENT), from expert speakers to language learners (see PRAGMATICS OF SECOND LANGUAGE COMPUTER-MEDIATED COMMUNICATION). Studies in this recent area range from the description of the basic pragmatics of computer-mediated communication (see PRAGMATICS OF CHAT) to studies of speech acts (e.g., Baym, 1996), illocutionary force (e.g., Dresner & Herring, 2010), identity (e.g., Nguyen & Kellogg, 2005), cross-cultural/intercultural communication (e.g., Belz & Thorne, 2006), interlanguage pragmatics (e.g., González-Lloret, 2008), or politeness (see POLITENESS IN COMPUTER-MEDIATED COMMUNICATION).

Associations, Journals, and Publications

Today's diverse and important developments in pragmatics research are disseminated through a growing number of pragmatics-specific venues in addition to those for applied linguistics in general. The first journal dedicated to pragmatics, *Journal of Pragmatics* (Elsevier), appeared in 1977. In the first editorial, Haberland and Mey (1977) proposed a shift of perspective for the study of language that would look not just at what an utterance means but to why an utterance is produced. Today, with 12 issues per year, the journal provides a forum for pragmatic studies in sociolinguistics, general linguistics, conversation analysis, discourse analysis, cognitive linguistics, computational linguistics, and applied linguistics among other areas of linguistic research (www.elsevier.com/wps/find/journaldescription.cws_home/505593/description#description).

In 1986 in Antwerp, the International Pragmatic Association (IPrA) was established "to represent the field of pragmatics in its widest interdisciplinary sense as a functional (i.e., cognitive, social, and cultural) perspective on language and communication" (Ipra Web site). The association's quarterly publication, *Pragmatics*, started in 1991. As of 2009 it is published online, with open access to all articles 12 months after publication (http://ipra.ua.ac.be/main.aspx?c=*HOME&n=1267). In Asia, the Pragmatics Society of Japan was established in 1998 and its journal has been published since 1999 (www.soc.nii.ac.jp/). And, since 2003, there also exists a China Pragmatics Association (www.cpra.com.cn/).

Currently, a plethora of journals and book series focus on different areas of pragmatics. Among journals: *Chinese Language and Discourse*, *Cross-Cultural Communication*, *Discourse & Society*, *Discourse Studies*, *Functions of Language*, *Intercultural Pragmatics*, *Journal of Historical Pragmatics*, *Journal of Politeness Research*, *Journal of Sociolinguistics*, *Language and Dialogue*, *Language in Society*, *Multilingua*, *Pragmatics and Cognition*, *Pragmatics and Society*, *Research on Language and Social Interaction*, *Semantics & Pragmatics*, *Spanish in Context*, *Studies in Language*, *Text & Talk*, *Speech Communication*. Among books: the *Pragmatics & Beyond* series (John Benjamins), *Interactional Sociolinguistics* (Cambridge), *Language in Society* (Oxford), and *Pragmatics and Language Learning*, and a monograph series connected to the International Pragmatics and Language Learning Conference (www.nflrc.hawaii.edu/searchsite_publication?keyword=PragmaticsLL&display_order=alphabetic).

This diversity of work falling under the pragmatics umbrella demonstrates the difficulty encountered in attempting a concise definition. Rather than a component of linguistics, pragmatics might best be seen as a perspective on language (e.g., Mey, 2001), a perspective which is interdisciplinary. Pragmatics as we know it today is informed by a variety of epistemologies, research methodologies, and philosophies of language. The investigations fuelling the field are conducted in a large variety of linguistic, social, and geographical contexts. The entries in this volume aim at reflecting the contextual richness and scope of the field, including contributing authors from Finland, Germany, United Kingdom, Spain, Sweden, Switzerland, Israel, United States, Canada, Japan, Korea, and Australia. They can be grouped within four large subareas of research: (a) language acquisition, both first (see CHILD PRAGMATIC DEVELOPMENT) and second language (see SECOND LANGUAGE PRAGMATIC DEVELOPMENT); (b) linguistics; (c) social/communication research; and (d) computer-mediated communications. Within each subarea, the entries address topics that outline what pragmatics is today, reflecting a variety of approaches, methods, epistemologies, and views of the world.

Pragmatics: Quantitative Methods

FRANCESCO ARCIDIACONO

Quantitative Methods and Pragmatics

Quantitative research has the goal to conceptualize the reality in terms of variables, to measure these variables, and to study the relationships between them (Punch, 2009). In the case of pragmatics (Ochs & Schieffelin, 1979; Green, 1989), the variables may be on categorical, ordinal, or interval scales, such as categorical variables that correspond to conversational or discursive strategies (Ochs & Schieffelin, 1983; Freedle, 1990). In pragmatics, different analyses can be applied to verify the inferential relations among variables, but in cases where there are three or more categorical variables multipath frequency analysis is especially useful.

The aim of this entry is to describe how to apply log-linear analysis as one type of multipath frequency analysis in order to explore pragmatic phenomena, using as an example data from a study on verbal conflicts in family conversations.

Overview of Verbal Conflicts and Log-Linear Analysis

Based on the belief that verbal conflicts among adults and children are educational tools of interaction and means of cultural socialization, this entry illustrates a quantitative method used to analyze these conversations (Arcidiacono & Pontecorvo, 2009). Parents–children’s adversarial conversations (video-recorded during everyday interactions at dinnertime, and then transcribed turn by turn) were categorized in terms of the following variables which were seen as relevant dimensions of conflict (Labov & Fanshel, 1977; Vuchinich, 1990; Garvey & Shantz, 1992):

1. the orientation (with two dimensions: serious, non-serious),
2. the modality (with two dimensions: mitigated, aggravated), and
3. the closing (with three dimensions: withdrawal, submission, compromise).

Traditionally, the quantitative technique used to measure the relationships between two categorical variables was to compare observed frequencies to the frequencies expected by either chance or a hypothesis, and then to compute the difference with a Pearson chi-square statistic (χ^2) in which a large value indicated that there is a relationship between the variables. For more than two variables, several chi-squares could be computed to measure the relationships between variables 1 and 2, variables 1 and 3, and variables 2 and 3, for example. While perhaps providing insight into the main effects of one variable on another, no insights would be gained on possible interactions among the three variables. In order to test for the statistical significance of the main and interaction effects between variables, a multivariate extension to chi-square tests called hierarchical log-linear analysis is used in which models are applied to represent the logarithm of the expected cell frequency as a linear combination of the variables’ effects.

2 PRAGMATICS: QUANTITATIVE METHODS

In our example, the following research question was addressed: What are the discourse patterns when parents activate the conflict with their children? We hypothesized an association between (a) serious and aggravated dimensions of the conflict with withdrawal as the closing strategy and (b) non-serious orientations and mitigated modalities with final compromises as the closing strategy.

An Example Study

Conducting the Analysis

A $2 \times 2 \times 3$ design was used in order to test three variables of verbal conflict and to explore the association among these factors and their levels. The data were analyzed using the statistical program BMDP Dynamic 7.0 (Brown, 1983). For this program, as the first step the researcher needed to type in syntax and to paste the control language (Table 1) at

Table 1 Control language

<i>Syntax</i>		<i>Description of codes and functions</i>
/ INPUT	TITLE IS "CONFLICT". VARIABLES = 4. FORMAT IS FREE.	Name of the file data Number of variables (including frequencies)
/ VARIABLE	NAMES = O, M, C, FREQ.	O = orientation; M = modality; C = closing
/ CATEGORY	CODES (O) = 1, 2. NAMES (O) = S, N. CODES (M) = 1, 2. NAMES (M) = MI, A. CODES (C) = 1, 2, 3. NAMES (C) = D, SO, CO.	Codes or cutpoints are required if there are more than 10 values for any categorical variable S = serious; N = non-serious MI = mitigated; A = aggravated D = withdrawal; SO = submission; CO = compromise
/ TABLE	INDICES = O, M, C. COUNT = FREQ. DELTA = 0.5	Variables defining indices for tables Variables containing frequencies when input is a cell indices and frequencies Value to be added to each cell before the analysis
/ FIT	MODEL = OMC. ASSOCIATION = 3.	Describes the log-linear models to be fit to data in a multiway table: the hierarchical model to be fitted Estimates partial and marginal association for all effects of order
/ PRINT	LAMB.	Specifies types of tables to be printed: the table of estimated log-linear parameters and their standard errors
/ END		End of the input of control language

Table 2 Data set

<i>Closing</i>	<i>Modality</i>	<i>Orientation</i>		<i>Total</i>
		<i>S</i>	<i>N</i>	
D	MI	2	7	9
	A	20	5	25
	Total	22	12	34
SO	MI	0	0	0
	A	22	0	22
	Total	22	0	22
CO	MI	12	3	15
	A	11	0	11
	Total	23	3	26

a command prompt in order to code variables and dimensions. Using a “free” format, variables are separated by one or more blanks, a single comma, or both. The file is then saved as a command file (format.DAT) that in our case was named Conflict.DAT.

Then the researcher enters the data as text (or using a pre-existing file in the computer system). Table 2 reports the data set for our study (including frequencies of each variable under examination). At the end, this input file is saved as Conflict.INP. The program is thus ready to run and to analyze the data.

As mentioned before, the use of log-linear models aims at understanding the relationships between factors through a screening for an appropriate model, testing, comparing, understanding models under consideration, and examining cells with large disparities between observed and expected values under a chosen model. According to Marascuilo and Busk (1987) “multidimensional contingency tables can be examined in a unified way by using log-linear models in either a hypothesis testing mode or model-building approach” (p. 443). In the first case, the researcher sets up a number of null hypotheses to be rejected.

Table 3 Hierarchical models of interaction

<i>Models</i>	<i>Description</i>
[OMC]	Multivariate dependence: model of saturation
[OM][OC][MC]	Multivariate independence: dependence of three couples of variables
[OM][MC]	Marginal multivariate independence: dependence of two couple of variables
[OM][OC]	
[OC][MC]	Marginal multivariate independence: independence of one variable from the other two
[OM][C]	
[OC][M]	H_0 —Multivariate independence: same probability for each category
[MC][O]	
[O]	
[M]	
[C]	

Table 4 Decisional models

<i>K-FACTOR</i>	<i>D.F.</i>	<i>LR CHISQ (G^2)</i>	<i>PROB</i>	<i>PEARSON CHISQ (χ^2)</i>	<i>PROB</i>	<i>ITER</i>
0-MEAN	11	92.15	0.00	92.14	0.00	0
1	7	43.33	0.00	41.71	0.00	2
2	2	0.43	0.80	0.47	0.79	11
3	0	0.00	1.00	0.00	1.00	1

In the second case, specific main effects and interactions are supposed to exist and inter-relations among variables are tested for goodness of fit.

In our case, the strategy was to compare sets of models and then to define models based on hypothesis tests for individual parameters within a specific set. Table 3 shows seven possible hierarchical models of interaction computed in the study: from the more complex [OMC], named the dependent model of saturation, to the simple model [O][M][C] that postulates the independence between variables. In log-linear analysis “the idea is to find the least complex model that nonetheless generates expected values not too discrepant from the observed ones, as determined by a goodness-of-fit-test” (Bakeman & Gottman, 1986, p. 194); so, three steps in the model-building approach include (a) a backward analysis that begins with the saturated model, (b) a consideration of more parsimonious models, and (c) an examination of each bi-dimensional interaction and main effects.

Results of the Study

After running the statistical program with the control language and the input data, we obtain the file Conflict.OUT containing different records. First, we consider the decisional table models (Table 4).

At this stage, the likelihood ratio chi-square G^2 (Marascuilo & Busk, 1987; Rojewski & Bakeman, 1997a, 1997b) is used as the associated statistical test in order to explore the decisional models and to test for goodness of fit. Starting from each specified model, the program deletes in turns each simple or multiple effect. Through backwards elimination the probability associated to the difference between the saturated model and the model that fits better is considered. By this procedure, the program automatically screens all possible models in a generating class hierarchy for the most parsimonious one. Starting with the saturation model is not required: whatever model the researcher starts with, the backward elimination algorithm drops the least useful term one step at a time, stopping when the deleted effect is significant. In a design with K variables, the K -factor interaction parameter ensures that the hierarchical structure of the model is preserved. The goodness of fit of a log-linear model is tested using the likelihood ratio statistic G^2 (instead of the Pearson chi-square statistic χ^2) because G^2 can be partitioned into unique components that have the additive property similar to the sum of squares of the analysis of variance. In other words, G^2 is additive under positioning for nested models and its p value has to be > 0.05 for a well-fitting model. At this stage, the expected frequencies need to be tabulated. For a three variables model, we use an iterative proportional fitting algorithm. This procedure permits adjustments to fit each of the marginal sub-tables specified in the model. In Table 4, the algorithm indicates the highest significance level for the K -factor = 2. Having dropped the three-way term, the remaining generating models are two-way interactions and main effects.

We now consider Table 5, in which marginal and partial association are simultaneously used to screen various interactions, and to determine whether they are necessary, not necessary, or questionable. Different G^2 statistics are assessed for each combination of the

Table 5 Association options

<i>Effect</i>	<i>Partial association</i>				<i>Marginal association</i>			
	<i>D.F.</i>	<i>CHISQ(G²)</i>	<i>Prob</i>	<i>Iter</i>	<i>D.F.</i>	<i>CHISQ(G²)</i>	<i>Prob</i>	<i>Iter</i>

OC	2	12.54	0.00	2	2	10.80	0.00	2
MC	2	21.16	0.00	2	2	19.41	0.00	2
OMC	2	0.43	0.80					

Table 6 Ratio of the log-linear parameter estimate to its standard error

	<i>Modality</i>		<i>Orientation</i>	
			S	N
<i>Closing</i>		MI	-2.66	2.66
	MI	A	2.66	-2.66
D	-0.53	0.53	-2.29	2.29
SO	-1.50	1.50	0.57	-0.57
CO	2.37	-2.37	1.18	-1.18

variables. As both tests lead to the same association options about the effects to be considered, no problem exists in choosing partial or marginal association (if either the partial or marginal test is not significant, judgments can be made according to the researcher's knowledge about the variables).

In our case, significant G^2 values concern the two-way interaction models.

Once estimates of expected frequencies are obtained, the effect parameter estimates are produced and related to odd and odd ratios. The models of two-way interactions [OM] [OC][MC] are then examined (Table 6). The estimates of the effects are similar to the calculation of main and interaction effects in a factorial analysis of variance. In our case we only consider the interaction effects because they override main effects. Odds are described as the ratio between the frequency of being in one category and the frequency of not being in that category. In order to investigate the quality of fit of the model further, we evaluate the individual cell residuals that show why a model fits or display a lack of fit. This process involves standardized residuals for each cell. The cells with the largest residuals show where the model is least appropriate.

Generally, odd ratios above 1 indicate positive association among variables, while odd ratios smaller than 1 indicate negative association. If the value is 1, the variables are not associated. In our case, significant associations concern a confidence interval of z-scores ≥ 1.96 and $p < 0.05$. In particular, the interaction between orientation and modality (i.e., the four cells at the top right side in Table 6) reveals an association between the serious orientation and the aggravated modality, while the mitigated modality is associated with the non-serious orientation ($z = 2.66$); the interaction between orientation and closing

(i.e., the six cells at the bottom right side in Table 6) confirms the association between the non-serious orientation and the withdrawal (recall that withdrawal was coded as “D” in the dataset) in closing conflicts ($z = 2.29$); the interaction between modality and closing (i.e., the six cells on the left side in Table 6) shows a significant association between the compromise and the mitigated modality to close a conflict ($z = 2.37$).

Results indicated that one discourse pattern used when parents activate verbal conflicts with their children was explained by a model associating the serious orientation to the aggravated modality (i.e., first hypothesis), but not necessarily followed by a withdrawal. When parents engage in a non-serious way, conflicts develop through a mitigated modality, in turn associated to a compromise as closing (i.e., second hypothesis). Another pattern indicates the interaction between the non-serious orientation and the withdrawal as closing.

Conclusion

As this analysis highlighted some discursive patterns generated by specific models, other possible lines of investigation (Arcidiacono, in press) have been devoted to specifically explore the cases in which children activate verbal conflicts with parents.

The use of log-linear models is useful to investigate association structures between a set of categorical variables, because “one of the advantages in using the log-linear models and the associated G^2 statistics is that there are many ways that one can partition the likelihood ratio statistic” (Marascuilo & Busk, 1987, p. 454). In applying the log-linear analysis, the use of the statistical program BMDP Dynamic 7.0 is based on a simple control language and a clear output. However, there are alternative options, such as ILOG, R, SAS, and SPSS software programs that offer practical solutions to combine different variables’ effects available to be interpreted by the researcher. In the case of quantitative methods in pragmatics, we also encourage an awareness of other different models for analyzing contingency tables that are based on the binomial or multinomial nature of a response variable (see also Goodman, 1964; Marascuilo, 1966; Marascuilo & McSweeney, 1977).

Prator, Clifford

MARIANNE CELCE-MURCIA

Clifford H. Prator (1911–93) was an exceptional administrator, a sociolinguist, a practical phonetician, and a language methodologist. Born in Fort Valley, Georgia in 1911, he completed his K-12 education there; while in high school, he developed a love for Latin and the Romance languages. He received his BA in French from Asbury College in Wilmore, Kentucky and pursued graduate work at the University of Michigan, where he received his PhD in Romance Philology in 1939. He then worked as an instructor of French and Spanish (1939–42) at the University of Michigan and became familiar with the work in English language teaching being done by the linguists Charles Fries and Albert Marckwardt.

After administering educational projects in Latin America (1943–6), Prator came to the University of California, Los Angeles (UCLA) in 1947 as an assistant professor of French. In 1949 he was transferred to the English department, having been asked to develop the first English as a second language (ESL) program for UCLA's burgeoning foreign student population. He also served as associate foreign student advisor for several years. Prator was promoted to associate professor in 1951 and to professor in 1960.

As vice chair of the English department and head of the ESL section, which he directed from its inception until 1974, Prator was the moving force behind development of both the postgraduate certificate in TESL (teaching English as a second language) and later the Master's degree in TESL. He also made important contributions to, and served as one of the early administrators (1977–9) of, UCLA's Interdepartmental PhD program in applied linguistics.

Some of Prator's most important yet least known work was as a sociolinguist doing language survey work, which then informed educational planning. This began with his groundbreaking report on language teaching in the Philippines (Prator, 1950), and included, among others, his coauthored report on language teaching in Kenyan primary schools (Hutasoit & Prator, 1965), a summary of research on language use and language teaching in East Africa (Prator, 1975a), work done at the Bourguiba Institute in Tunis and the American University of Cairo, and a comparative summary of Ford Foundation projects in North Africa and the Middle East in which he had been involved in the mid-1970s (see Fox, 1975, for more detail).

Prator's best known work relating more generally to the teaching of English as a second or foreign language is his *Manual of American English Pronunciation* (1957). This textbook went through four editions between 1957 and 1985, the last two editions having been coauthored with B. W. Robinett. The fourth edition (Prator & Robinett, 1985) is still being used as a textbook and reference. One related journal publication (Prator, 1971) deals with the question of when it is important to teach allophonic accuracy rather than just phonemes in English pronunciation instruction.

Among Prator's better known articles dealing with language methodology is "In Search of a Method" (Prator, 1980), which critiqued the orthodox audio-lingual approach to language teaching and offered instead an eclectic and pragmatic approach based on ten guiding principles, which included: no method provides the whole answer, practical experimentation trumps doctrinaire allegiance, the needs and motivations of your students are the primary concern, and what is new is not necessarily better. As one of Prator's

former students and colleagues, this author's personal favorite among his methodology articles is "Development of a Manipulation-Communication Scale" (Prator, 1975b), in which he criticizes audio-lingualism and calls for greater attention to meaning and communication, arguing that language teaching needs to move from manipulation to communication, which is the ultimate aim of instruction. Although only a published version of this short paper could be found in a source from 1975, this author remembers learning the content in a class she took with Prator in the fall semester of 1962. Prator's (1991a) paper "The Cornerstones of Method" also reflects his eclectic approach to methodology in that the three cornerstones he discusses are: (a) linguistics (what we know about language), (b) psychology (what we know about learners), and (c) education (what we know about the aims of instruction).

Prator's most controversial publication, which has been published (Prator, 1968) and republished many times (most recently perhaps in Prator, 1991b) is "The British Heresy in TESL." In this article Prator is polemic rather than eclectic, which was quite atypical if one judges his publications collectively. He attacks the British inclination to allow local non-native varieties of English to develop and establish themselves as standards in former colonies, especially with respect to pronunciation. Prator argues that such a policy can only lead to increasingly divergent varieties of English that will ultimately have no international intelligibility. Prator contrasts this "heretical" position with that of language educators in France and in the USA, who favor teaching the native speaker standard in pronunciation lessons. Over the years, Prator's fiercely polemic view in this article has been presented alongside more progressive and pragmatic positions on the emergence of "World Englishes." Unfortunately, those who know Prator only through this article have a skewed and incomplete notion of his accomplishments.

After his retirement in 1979, Prator continued for many years to teach his remarkable graduate seminar on language policy, based on his extensive work overseas. By his own oral history account in the UCLA Special Collections, Prator worked in Latin America in Colombia, Brazil, Chile, Peru, Argentina, Mexico, and Ecuador. In addition, Melvin J. Fox (Fox, 1980) of the Ford Foundation has reported first-hand knowledge of teaching, surveys, or projects that Prator did in Algeria, Egypt, Ethiopia, Ghana, Jordan, Kenya, Morocco, the Philippines, Tanzania, Tunisia, Uganda, and Zambia. There are undoubtedly other countries where he did research or consulting.

The relationship between Prator's overseas projects and the development of the TESL and applied linguistics programs at UCLA was symbiotic and truly extraordinary: the projects brought hundreds of foreign professionals to UCLA for graduate study or as visiting scholars, and they created opportunities for US graduate students and faculty to work overseas, thereby contributing to the growth and excellence of the UCLA graduate programs he had created.

Prator was also active in several professional organizations. He was a member of the board of directors of NAFSA (the National Association of Foreign Student Advisors) for six years and served its English language section for one year as vice chair and two years as chair. He also served TESOL (teachers of English to speakers of other languages) both as a member of the executive board and as vice president. In addition, he was on the advisory committee of CAL (the Center for Applied Linguistics) in Washington, DC.

Those who knew Clifford Prator remember him as an intellectually discerning academic, a supportive yet demanding mentor, a gifted administrator (who always seemed to get his way), and a genuine internationalist.

Praxis and Second Language Acquisition

JAMES P. LANTOLF

The focus of the present entry is on *educational praxis* in second language development. Praxis, in this case, is defined as the necessary integration of theoretical knowledge of features of a language and concrete goal-directed communicative activity. The integration is understood from the perspective of dialectics, as will become clear throughout the remainder of this entry.

According to Vygotsky (1997a, p. 88) education is defined as “the artificial development of the child. Education is the artificial mastery of natural processes of development. Education not only influences certain processes of development, but restructures all functions of behavior in a most essential manner.” Education is not just an undertaking whereby knowledge is obtained, but it is an intentionally organized, and therefore artificial, activity that restructures mental behavior. This position is diametrically opposed to classic Piagetian psychology, a perspective that is reflected in many SLA theories whereby instruction is only seen as effective if students are developmentally ready to learn. On this view, instruction becomes a matter of timing and if, as Ellis (2007, p. 91) suggests, it is “ill-timed and out of synchrony with development . . . it can be confusing; it can be easily forgotten; it can be dissociated from usage, lacking in transfer-appropriateness” and “it can be unmotivating.” Vygotsky (1987) reverses the Piagetian process and argues that effective instruction must precede and indeed lay down the path for development to follow. This of course is the basis of Vygotsky’s most popular, though often misunderstood concept of the *zone of proximal development* (ZPD).

A sociocultural-theoretic approach to L2 teaching and learning challenges one of the foundational assumptions of most SLA research, which makes a distinction between basic research and theory, on the one hand, and classroom practice, on the other. Gass and Mackey (2007, p. 190), for example, reflect this perspective as follows: “Like most SLA researchers, however, [Rod] Ellis is cautious about making direct connections between theory, research, and teaching practice.” With regard to their own interactionist approach to SLA, the same authors go on to state that because their primary concern is with “how languages are learned . . . direct application may be premature.” Consequently, researchers have frequently voiced concern over how to bridge the gap between theory or research, on the one hand, and practice, on the other (see Erlam, 2008).

In an early book-length manuscript written around 1926 but not published until 1982 entitled *The Historical Meaning of the Crisis in Psychology: A Methodological Investigation*, Vygotsky (2004) lays the foundation for his theory of human psychology—a foundation clearly linked to Marxist philosophy and in particular the 11th thesis on Feuerbach: “Marx has said that it was enough for philosophers to have interpreted the world, now it is time to change it” (Vygotsky, 1997b, p. 9). For Vygotsky this means that psychology must reconceptualize the relationship between theory/research and practice. Rather than two separate undertakings, he argued that they are in fact two necessary components of a single dialectically unified activity—*praxis*. In the following quote from *The Crisis in Psychology* Vygotsky describes the relationship:

2 PRAXIS AND SECOND LANGUAGE ACQUISITION

Previously theory was not dependent on practice; instead practice was the conclusion, the application, an excursion beyond the boundaries of science, an operation which lay outside science and came after science, which began after the scientific concept operation was considered completed. Success or failure had practically no effect on the fate of the theory. . . . Now the situation is the opposite. Practice pervades the deepest foundations of the scientific operation and reforms it from beginning to end. Practice sets the tasks and serves as the supreme judge of theory, as its truth criterion. It dictates how to construct the concepts and how to formulate the laws. (Vygotsky, 2004, p. 304)

For Vygotsky, the previous distinction between general and applied psychology no longer holds and, in effect, applied psychology *is* psychology. The new psychology must be anchored in *praxis*: the approach to scientific research where theoretical statements are put to the test in concrete practical activity. To paraphrase Sanchez Vazquez (1977, p. 99), *praxis* is the dialectical unity of the ideal (i.e., theory) and objective material activity (i.e., practice). With regard to the topic at hand, this requires a two-way relationship between theoretical knowledge of a language and the use of this knowledge to carry out specific communicative (oral and written) activities in all spheres of human social interaction. The next section considers the implications of a *praxis*-based orientation for L2 education.

Praxis in L2 Education

It is fair to say that most SLA researchers assume that cognitively the process of acquiring a second language is universal; that is, no matter where acquisition occurs, in the everyday world or in a formal educational setting and everywhere in between, the psychological mechanisms that guide the acquisition process are the same (see Long, 2007). From the perspective of sociocultural theory (henceforth, SCT), however, because the social environment plays a central role in psychological development and because the environment varies, L2 development is not necessarily a universal process. In other words, learning a new language in the everyday world entails different mechanisms from learning the same language in a formal educational setting. To appreciate the significance of this argument, it is necessary to discuss briefly the important distinction Vygotsky makes between *scientific* and *spontaneous* concepts.

Scientific and Spontaneous Concepts

Although the ZPD is arguably the most well known and widely adopted feature of Vygotsky's theory, his proposal that the basic unit of formal education is conceptual (some use the term "theoretical") knowledge of a given domain as formulated through scientific research is in many ways more important. Scientific concepts "represent the generalizations of the experience of humankind that is fixed in science, understood in the broadest sense of the term to include both natural and social science as well as the humanities" (Karpov, 2003, p. 66). These concepts are explicit, and therefore accessible to conscious inspection, domain specific, and "aimed at selecting the essential characteristics of objects or events of a certain class and presenting these characteristics in the form of symbolic and graphic models" (Karpov, 2003, p. 71).

Scientific knowledge contrasts sharply with what Vygotsky calls *spontaneous* knowledge formed during concrete practical experience largely on the basis of "an immediate observable property of an object" (Kozulin, 1995, p. 123). Spontaneous knowledge is empirically based, usually, though not exclusively, inaccessible to conscious inspection, and requires lengthy periods of practical experience to develop. This type of knowledge, as Karpov

(2003, pp. 69–71) points out, “may work if the common salient characteristics of objects or events reflect their significant, essential characteristics” but it runs into problems on several counts, such as when the observable common features of a set of objects are not the essential features of the entire class of objects under consideration. As Vygotsky (2004) noted, the goal of science is to discover through rigorous analysis the usually hidden essence of the object of inquiry. If things were the way they appeared under the direct scrutiny of our senses, science (and concomitantly education) would be unnecessary. To illustrate the distinction between spontaneous and scientific knowledge, consider how the concept *circle* is understood in the two domains. Our everyday knowledge of circle is a generalization usually arrived at by extracting the common geometric shape of objects such as wheels, pancakes, bracelets, coins, etc. It is often the way teachers introduce the concept in school. The scientific concept of circle, on the other hand, is “a figure that appears as the result of a movement of a line with one free and one fixed end” (Kozulin, 1995, p. 124). The scientific definition, according to Kozulin, encompasses all possible circles and “requires no previous knowledge of round objects to understand” (p. 124).

An especially relevant type of spontaneous knowledge, Vygotsky (1987, pp. 202–5) suggested, is the unconscious knowledge that children develop of their native language. Children’s appropriation of their first language is by and large implicit and not open to conscious inspection. As Wertsch (2007, p. 185) notes, we acquire our first language in childhood not as something to be intentionally appropriated but as a means of mediating our participation in specific cultural activities (e.g., meals, play, scoldings from parents, etc.). When children come to school, however, and enter into activities mediated by written texts, what had been previously invisible becomes visible and available for conscious inspection and analysis. At this point, education places systematic focus onto language as a legitimate object of study with the purpose of helping children gain intentional control over the most important symbolic artifact developed by human culture. The quality of intentional instruction, however, is crucial in determining the level of control achieved (Vygotsky, 1987).

Vygotsky (1987, p. 218) argued that scientific and spontaneous knowledge each have their strengths and weaknesses. The strength of the latter is that it is saturated with personal experience and its use is spontaneous, or automatic. Its weakness consists in the fact that it is tied to concrete empirical situations and is therefore not sufficiently flexible so as to be easily extended to a wide array of circumstances. Its automatic quality, which is part of its strength, is at the same time a weakness. The fact that spontaneous knowledge is not easily accessible to conscious inspection means that we have less intentional control over it in order to make it serve our needs.

By the same token, the strength of scientific knowledge resides in its visibility and rigor, which imparts greater flexibility and control to the individual. However, its weakness is that it does indeed lack rich personal experience and it also requires a fair amount of time to gain the necessary automatic control (i.e., proceduralization) over it. Thus, for scientific knowledge to be of value it must be connected to practical activity—the domain where spontaneous knowledge dominates, otherwise the result is what Vygotsky, among others, describes as “verbalism”; that is, knowledge “detached from reality” (Vygotsky, 1987, p. 217). As Ilyenkov (1974) warns, verbalism is “that chronic disease of school education” that leaves people with the inability to connect systematic scientific knowledge to practical concrete activity. Indeed, unless the connection is made we do not develop knowledge as such but only “an illusion” or “surrogate” for knowledge (Ilyenkov, 2007, p. 71). The needed connection is what praxis is all about. The following section focuses on praxis in L2 instruction.

Systemic-Theoretical Instruction and L2 Praxis

Two of the most important scholars to propose pedagogical approaches grounded in Vygotsky's praxis-based psychology are Gal'perin (1979) and Davydov (2004). Each scholar developed a slightly different model of educational praxis. Because my intent is to provide the reader with a general understanding of L2 praxis rather than with information on the subtleties between the two models, and because, with the exception of Ferreira (2005), most of the L2 praxis research draws on Gal'perin's model, I will focus exclusively on his approach, referred to as systemic-theoretical instruction (STI)—an approach to education which centers on learner understanding and internalization of scientific concepts.

Gal'perin proposed a multiple-phase procedure, which begins with presentation of the concept and terminates with its automatization (i.e., internalization) in practice. These phases are bridged by two additional procedures: materialization and verbalization. Verbalization, in turn, comprises two subcomponents: verbalization of the concept as such and verbalization of the concept as it accounts for and guides one's performance of practical activity. Verbalization requires learners not to memorize the verbal definition of the concept but to use a SCOPA, or schema for the orienting basis of action (see Figure 1) as a guide to self-explanation of the concept through private speech. This forces learners to listen to themselves and determine whether or not they feel they indeed understand the concept. It also compels them to externalize their reasons for deploying the concept as they do. Externalization is an essential aspect of psychological development that further deepens understanding of, and control over, concepts. Materialization requires the conversion of the verbal representation of the concept into an imagistic depiction, or SCOPA, on the theoretical assumption that a concrete image is more coherent, more easily comprehended and thus serves as a more flexible guide of activity than does a verbal definition alone.

While some L2 researchers such as Rod Ellis acknowledge a role for explicit (i.e., conscious) knowledge in L2 instruction, most do not pay sufficient attention to the impact of the quality of such knowledge on learning (however, see DeKeyser, 1998). Hammerly (1982, p. 421), for example, supports rule-of-thumb knowledge, which he describes as "*simple, nontechnical, close to popular/traditional notions*" (italics in original), and recommends that grammar explanations be "short and to the point" because if they are complex and extensive "it is too much for the students to absorb" (p. 421). The problem with this approach to explicit knowledge is that rules-of-thumb are not always complete, coherent, or accurate. They generally describe what is typical in a specific context rather than an abstract principle that promotes a deep understanding of the concept allowing learners to use the language flexibly across an array of contexts.

Whitley (1986) offers a good example of a typical rule-of-thumb presented in textbooks for teaching Spanish to L1 English speakers. The rule describes use of verbal aspect (preterit/imperfect): preterit "reports, records, narrates, and in the case of certain verbs (e.g., *saber*, *querer*, *poder*) causes a change of meaning" and imperfect "tells what was happening, recalls what used to happen, describes a physical or mental emotion, tells time in the past, describes the background and sets the stage upon which another action occurred" (Whitley, 1986, p. 108). The problem with the rule, as with most empirically based rules, is that it is not fully accurate, because while one can find evidence of use of verbal aspect that accords with the rule, it is also the case that one easily finds exceptions to the rule, as for instance use of preterit to describe emotions. The problem is that most textbooks provide examples of language designed specifically to illustrate and therefore support the function of the rule. Ilyenkov (1974) calls this circumstance application of the "notorious principle of visual learning." The result is that the real object of study "remains outside the classroom door, beyond the boundaries of the academic subject" (Ilyenkov, 1974). The rule-of-thumb

approach along with the principle of visual learning gives the impression that language study is about learning to produce correct forms while avoiding incorrect forms rather than understanding language as a cultural artifact for meaning creation in social and psychological activity.

L2 Studies

Two early studies on L2 instruction within Gal'perin's framework were both successful but very short-term projects, each lasting only a few hours. The first by Carpay (1974) was concerned with Russian verbal aspect and the second by van Parreren (1975) dealt with attributive adjectives in German. Oboukhova, Porshnev, Porshneva, and Gaponova (2002) conducted a more extensive study lasting several weeks on teaching verbal aspect in L2 French to L1 Russian speakers. In the study the concept of aspect was materialized as a cartoon and presented via computer. The students then completed a series of activities based on the cartoon in which they were asked various questions about the formation and use of French verbs. While this was happening, the conceptual explanation of how to form and use aspect in French was displayed in a corner of the computer screen. When completing the activities the students were required to verbalize their reasons for inflecting verbs for either of the two aspects of French. As they moved through the activities, the explanation displayed on the computer screen became increasingly abbreviated. Over time the students' verbalizations also were increasingly abbreviated until they became subvocal private speech. However, whenever the students made a mistake, they were cued to externalize their explanation. This process was continued until the students were able to complete a sequence of activities without recourse to externalization. The learners' performance on a posttest narrative was significantly better than a control group that had not received the computerized instruction. In interviews conducted with the learners, one of them commented that concept-based instruction made things easier and that "the learned knowledge has remained in my head" (Oboukhova, et al. 2002, p. 112).

Negueruela (2003) and Yáñez-Prieto (2008) reported on long-term studies in which Gal'perin's model was implemented in normal 16-week university Spanish L2 classes. It is important to recognize that in both studies the classes were not conducted as experimental or quasi-experimental activities. Students enrolled as they would in any language course and the syllabus followed was the same as in other sections of the course. The only difference was that the pedagogical principles followed for instruction in specific features of the L2 were rooted in SCT and Gal'perin's model of developmental education. In Negueruela's study the features designated for STI were verbal aspect, mood, and article use, and in Yáñez-Prieto's project verbal aspect as well as figurative language was the object of special instruction. These two studies have been reported on in a number of different publications, including Lantolf (2007, 2008). Swain, Lapkin, Knouzi, Suzuki, and Brooks (2009) traced the development of learner understanding and use of active, passive, and middle voice in L2 French. The findings of the study reveal that learners were able to develop a deeper understanding of the concept of voice as a result of instruction provided through a SCOPA integrated with the activity of *linguaging*, Swain's (2006) terminology for use of language (spoken or written) with a psychological rather than social function.

A more recent study by Lee (2010) integrates scientific principles from cognitive linguistics with pedagogical principles from Gal'perin's pedagogical model to provide instruction on the notoriously difficult English phrasal verb constructions for university ESL learners in a North American setting. Lee's SCOPA for phrasal verbs that integrate the particle "out" is given in Figure 1.

Frame 1 visualizes the basic concept imparted by "out" in English whereby the particle indicates a position external to a container. Frame 2 depicts movement of an individual

Figure 1 SCOBAs for particle “out” (Lee, 2010). © H. Lee

entity out of a collection or set of other individuals, as in “The teacher gives out the activities work sheets.” Frame 3 shows movement out of a container, as in “Mary ran out of the house,” and frame 4 illustrates the increase in the boundaries of a container, as in “Fred spread out the map on the table.”

A difficult feature of phrasal verbs for learners to master is their metaphorical use. Using the SCOBAs such as given in Figure 1, Lee was successfully able to explain to learners the relationship between literal and figurative meanings of phrasal verbs formed with “out” (Lee also provided instruction on two additional particles, “up” and “over”). Metaphorical uses of “out” include the following: “It turned out that Nancy had written the letter,” “Bad storms always bring out people’s anxiety,” and “At some point fossil fuels will run out.” Through a series of pre- and posttests, Lee reports considerable improvement in the learners’ ability to correctly interpret both the literal and metaphorical uses of phrasal verbs. In the case of “out” mean performance improved from nearly 56% accuracy on the pretest to 74% accuracy on the posttest among a total of 23 students who participated in the course. The improvement for “up” and “over” was approximately the same in percentage increase from pre- to posttest scores. Through communicative practice guided by SCOBAs, learners eventually internalize the relevant concept and are able to use it to mediate their performance in the L2.

On the other hand, a study carried out by Ferreira, and discussed in Ferreira and Lantolf (2008), yielded mixed findings. The study was based on a semester-long university course on ESL writing in which genre as defined in Halliday’s system-functional linguistics was the scientific concept around which the course was organized. Although some of the students improved in their writing, as assessed by independent judges, and in their understanding of the concept of genre, as determined by self-explanations of their performance and by comparisons of genre features in their own culture and Anglo culture, others were resistant to STI. They complained that they found the approach too “theoretical,” and that they failed to perceive the relevance of conceptual knowledge for writing performance. Similar resistance was reported by Negueruela (2003) and Yáñez-Prieto (2008) at the outset of their courses but this faded as the learners eventually developed an appreciation for the significance of conceptual knowledge for their own learning. The source of the resistance in all three studies was the students’ previous educational experiences. In Negueruela (2003) and Yáñez-Prieto (2008) the students had to confront the fact that they had internalized

rules-of-thumb that were not useful. The confrontation took place in self-talk as they attempted to explain new concepts and their own performance to themselves—an important component of concept-based instruction as formulated by Gal'perin. In Ferreira and Lantolf (2008) it was hypothesized that the resistance emanated from previous writing courses where instruction was heavily reliant on specific empirical guidelines that, if followed, would result in the production of acceptable English texts and where discussion of the abstract conceptual basis of quality texts was avoided.

An important aspect of language instruction grounded in praxis is as follows: because of the dialectic of conceptual knowledge and concrete practice, development is expected to take place in both domains. That is, educators and researchers have generally been interested in the effects of particular instructional behaviors on learner performance. While this is of course paramount, according to Negueruela (2003), development in the conceptual domain is no less important. This is because both components of a dialectical process require growth. In other words, improvement in performance is connected to improvement in conceptual knowledge. It is possible for one component to grow without concomitant growth in the other. With regard to performance, given sufficient time and exposure, learners are able to increase their proficiency in a language. However, this can take a great deal of time and effort on the part of learners, and many learners often give up before attaining reasonably high levels of proficiency. Moreover, because performance in the absence of understanding as Vygotsky (1987) argued, as in the case of L1 learning, is often closely tied to specific contexts of language use, it is not so easy for learners to transfer improvements in one context to another context. On the other hand, development of conceptual knowledge decoupled from concrete practical experience is essentially nugatory. Dialectical development based on praxis requires interaction between both components. Each feeds the other and as a result learners are empowered to effectively engage in communicative activity in a wide array of contexts. Not too surprisingly, development of the conceptual component often precedes development of the practice component; on the other hand, the practice component, as Vygotsky argued, provides the test of the effectiveness of conceptual knowledge. This developmental profile was quite apparent in the studies surveyed in this article, and it was especially clear in Ferreira's (2005) project where learners showed progress in their understanding of the concept of genre but, for the most part, improvement in writing performance lagged behind.

Conclusion

Praxis—the dialectical unity of theory/research and practice—is the foundation on which Vygotsky's psychology of human development is built. It has particularly important implications for education, which is a specific type of cultural activity organized around scientific knowledge as the basic unit of instruction. However, scientific knowledge by itself is dormant and of little value in promoting genuine development. It must be married to concrete goal-oriented activity. The manifestation of L2 educational praxis described in this entry is systemic-theoretical instruction, which provides students with coherent, sophisticated, but at the same time comprehensible concepts of relevant features of the target language. This is achieved through SCOBAs, which are imagistic representations of the concepts that mediate and promote improved understanding of and performance in the L2. The goal is not for learners to behave like native users of the language but to intentionally create their own meanings that may or may not reflect what native users do. In this way, L2 instruction empowers learners to use the new language to fulfill their particular needs rather than some predetermined expectations of how the new language should be deployed.

Prediction in Teaching Pronunciation

WAYNE B. DICKERSON

Learners and teachers of English as a second or foreign language (ESL/EFL) take for granted that learning grammar means learning rules. They do not often think of learning rules for pronunciation. Instead, images of listening and speaking come to mind.

Prediction as an Aid to Instruction

Despite these dominant images, rules have been part of pronunciation textbooks for more than a half-century, guiding learners on how to pronounce the {Z} and {D} morphemes, place discourse stress, and use intonation (Prator, 1951). Listening and speaking come to mind because pronunciation learning was conceptualized as forming new oral-aural habits through abundant, if not always meaningful, drill work. In this context, prediction was an *aid* to learning, not an *aim* of instruction.

Prediction as an Aim of Instruction

With the advent of transformational-generative grammar and cognitive psychology in the 1960s, the case for language being rule-governed rested largely on rules of syntax (Chomsky, 1959). However, in 1968, with the publication of *The Sound Pattern of English*, Chomsky and Halle demonstrated the broadly rule-governed nature of phonology.

The cognitive revolution in linguistics invited a reevaluation of pronunciation teaching, starting with its goals. Seen through the lens of the competence/performance dichotomy (Chomsky, 1964), the emphasis of pronunciation on listening and speaking was all about performance. By contrast, the new linguistic model suggested that pronunciation teaching should be about developing learners' competence in the new sound system. While fundamental, a knowledge of rules is insufficient for second language learners; they still need good listening skills (perception) and articulatory control (production) to communicate. From this reevaluation came the conviction that pronunciation instruction should add a third goal: developing prediction skills. This trilogy of goals (prediction, production, perception), called the 3Ps (Dickerson, 2004), elevates prediction to the same status as production and perception and highlights the value to learners of making good judgments about the sounds to use even before (*pre-*) speaking (*-diction*).

Preparing to Teach for Prediction

If prediction was to become a beneficial third goal for pronunciation teaching and learning, then three challenges had to be addressed. First, no repository of learner-friendly rules covering English pronunciation existed. Second, even if such rules were available, no understanding of how formal rule learning might affect one's spontaneous speech had yet surfaced. Third, no pedagogical materials built around the 3P model had been developed to show how to present the rules, offer the right kinds of practice, and test prediction skills.

2 PREDICTION IN TEACHING PRONUNCIATION

The story of prediction in teaching pronunciation is the story of how language teachers have tried, and continue to try, to meet these three challenges.

Learner Rules for Pronunciation

Applied linguists have contributed learner rules to pronunciation teaching for many years. In the areas of phrase and discourse phonology—discourse stress (also called *accent*, *nucleus*, *prominence*), intonation, and rhythm—rule use was the earliest to develop.

While rules for contrastive stress were well known (Prator, 1951), learners had to await the descriptive work of Halliday (1967) before rules for non-contrastive discourse stress began to appear in pronunciation textbooks (Gilbert, 1984; Dickerson, 2004). Communicative language teaching in the 1980s spurred on the development of rules for discourse stress (Hahn & Dickerson, 1999).

Croft (1961) popularized the Trager-Smith (1951) analysis of English intonation (based on Pike, 1945). O'Connor (1967) synthesized British work on intonation for learners of English. Brazil's work on intonation patterns for learners (1994) goes back to his analytical work in the late 1970s and early 1980s and is still influencing pedagogical texts (Gorsuch, Meyers, Pickering, & Griffiee, 2010). Using various notational devices, pronunciation texts associate intonation patterns with sentence types or pragmatic functions, such as a rising contour for a tag question indicating uncertainty but a falling contour for a tag question seeking confirmation (Lane, 2005).

Pike (1945) described English-style rhythm as stress-timed. Prator (1951) and Lado and Fries (1954) integrated his description into their pedagogical texts. Since then, that description of English rhythm, with its beat controlled by the prominent stresses of content words, has echoed across the decades to current texts like Lane (2005).

While predicting vowel reduction in function words has been a staple in pronunciation materials for more than a half-century, the prediction of other rhythm-facilitating features, like linking, trimming, and palatalization, became popular only in the early 1980s as another by-product of communicative language teaching. Now nearly all pronunciation texts guide learners to predict natural speech phenomena (Weinstein, 1982).

By contrast, a particularly challenging area of rule writing has been word-level phonology, covering the consonants, vowels, and position of stress in polysyllabic words. Early efforts to use standard orthography as a guide to segmental phonology (e.g., Prator, 1951) made progress with consonant prediction. But, with vowel prediction, they oversimplified patterns in the two ways that phonics had, namely, by offering non-distinctive patterns and by ignoring the defining role of word stress in vowel quality. Stressless vowel patterns (e.g., Gilbert, 2001) can sometimes narrow the range of pronunciation options, but they cannot truly predict vowel sounds; for nearly every spelling pattern predicting a stressed vowel, its unstressed counterpart predicts a reduced vowel. To be more helpful, Dickerson (2004) reanalyzed English vowel spelling for learners, making use of predictable word stress. He also went beyond major stressed vowels to provide accessible rules for all vowels in a word, stressed and unstressed.

Acknowledging the importance of word stress, textbook authors over the years have tried to help learners with the stress of words. O'Connor (1967) and Bowen (1975) say that you have to memorize the stress of a word because it is unpredictable. In a similar vein, Prator (1951) directs the student to a dictionary for the stress of a polysyllabic word. Trager and Henderson (1957) suggest that learners will get the feel for word stress by practicing each pattern (e.g. ˈ ˌ ˘) using illustrative words. From such practice learners learn the patterns but not which word uses each pattern. Prator and Robinett (1972) offer statistical guidelines for the stress of two-syllable words. However, there is no way to

know if a particular word is among the 75% that follow the rule or the remaining 25%. For the stress of words longer than two syllables, a popular approach has been to use word endings as a guide (Dauer, 1993). But not all polysyllabic words have endings. Another approach suggests that the stress of a root form can guide you to the stress of a derived form; for example, from *agréé*, predict *agrément* (Lane, 2005). Unfortunately, learners frequently do not know the stress of the root form, and not all polysyllabic words have a root form. For many derivatives, the stress also changes, e.g. *préside*, *président*, *présidentiel*. These nonsystemic approaches can help learners, which is why they continue to appear in current textbooks (Dauer, 1993). But they do not offer comprehensive guidance, especially for words that learners have never before encountered.

Unique among ESL texts are those that attempt a system-level solution to word-stress prediction that can provide a solid basis for vowel prediction. In the 1970s, before word stress was generally acknowledged to be rule-governed, Guierre documented some 30 word-stress patterns for learners, showing that English word stress is overwhelmingly predictable. He later showed how stressed vowels could also be predicted (Guierre, 1984). Dickerson (2004), whose work began in the mid-1970s, reduced learner word-stress rules to four, drawing on his own research and on Chomsky and Halle (1968). He associated vowel prediction with each stress rule so that learners who predict the stress of a word would also know how to pronounce its stressed and unstressed vowels (see examples below).

The main difficulty with many learner rules is their inconsistent adherence to principles of good pedagogical rule writing. The most important principle to respect is the No-Prior-Knowledge Assumption (NPKA) (Dickerson, 1983): A learner rule must not require the learner to already know the target language (e.g., the meaning or pronunciation of words) or to have specialist knowledge about the target language (e.g., word etymology). It must be fully accessible to literate learners with minimal prerequisites for its use. Stated this way, the NPKA is obvious. It is nevertheless often violated (Dickerson, 1990).

According to Dickerson, a good learner rule must do the following:

1. Adhere to the No-Prior-Knowledge Assumption.
2. Apply unambiguously; the trigger implicating it is well defined.
3. Operate mechanically; its output must not rely on guessing.
4. Yield a single, unitary output, except where acceptable variation exists.
5. Generate a pronounceable output in one pass; cyclic rules are too burdensome.
6. be productive; a rule for a handful of words is not worth the bother.
7. Be accurate; the larger the word group, the higher the predictive accuracy should be because of the exceptions to be learned. Common exceptions must be listed.
8. Be memorable; it must be brief, simple, template-like for segmentals, and in a form that can be practiced easily.

Word-Level Rules Exemplified

Learner rules for phrase- and discourse-level phonology, as noted above, are common in pronunciation textbooks. By contrast, word-level rules are much less so. Therefore, we illustrate two system-level word-stress rules found in Dickerson (2004) and Hahn and Dickerson (1999) and a sample of their associated vowel patterns to show how they satisfy the NPKA and other pedagogical rule-writing principles.

While conventional wisdom disparages standard orthography, Chomsky and Halle (1968, pp. 48–9, 96, 184n.) commend it repeatedly as remarkably close to the ideal representation of English words. For learners, this contrarian endorsement means that the common spelling of words provides superb input if rules are written to use such input.

4 PREDICTION IN TEACHING PRONUNCIATION

As background, two powerful, simplifying insights derived from Chomsky and Halle (1968) guided Dickerson's pedagogical work on word stress and vowel prediction. First, polysyllabic English words have major stress *on only one of two possible syllables*—in Dickerson's terminology, the *Key Syllable* (the *Key*) and the *Left Syllable*, immediately to the left of the Key. The Key Syllable is the starting point for each word-stress rule which tells the learner whether the major stress falls on the Key or the Left Syllable. Second, no vowel in English can be predicted without first knowing its stress.

The Key Stress Rule (KSR) applies to words having -iV endings, defined as the letter *i* followed immediately by the letter *a, o, u*, or by *enC*, words like *Virgin(ia, radi(o, convoluti(ion, gymnas(ium, conveni(ent. In this set of more than 10,000 words, the Key Syllable is immediately to the left of the -iV ending, as underlined above. The pedagogical rule states simply: For KSR words, place major stress on the Key, as in *gymnásium, convénient*.*

To predict the stressed vowel left of the KSR ending (K), note that the letter *i* followed by one consonant letter (C) predicts a lax vowel ($iC + K = \text{lax}$), as in *Virginia*, while all other vowel letters followed by one consonant letter predict tense vowels ($\check{V}C + K = \text{tense}$), as in *convénient* (Dickerson, 1980).

We illustrate the Left Stress Rule (LSR) as it applies to long -y nouns, namely, to nouns that end in a -y and have at least two syllables to the left of the -y, like *immunity, majesty, melody, agility, tyranny, colony. The Key Syllable is immediately to the left of the -y ending, as underlined. The Left Syllable is immediately to the left of the Key. The rule states: For LSR words, place major stress on the Left Syllable, as in *týranny, cólony*.*

To predict stressed vowels in the Left Syllable ($\leftarrow$), note that the letter *u* followed by one consonant letter predicts a tense vowel ($uC\leftarrow = \text{tense}$), as in *immúnuity*, while all other vowel letters followed by one consonant letter predict lax vowels ($\check{V}C\leftarrow = \text{lax}$), as in *májesty* (Dickerson, 1980). By stressing left, the Key is predictably unstressed.

Only four vowel quality patterns (VQPs) are illustrated here. They are still enough to show that, while good patterns can be simple, they are not sufficient. Learners also need a mechanical way to convert the predicted lax and tense vowel qualities into the correct vowel sounds or symbols. Several approaches are available. Gilbert (2001) offers one for her special vowel symbols. The one found in Dickerson's work can be used for traditional vowel symbols. It is called the Name-Shape Translator.

The translator works like this: If the VQP predicts a tense vowel for a vowel letter, then the learner uses the English *name* of that vowel letter as the sound of the target vowel. If the VQP predicts a lax vowel for a vowel letter, the learner uses the *shape* of the vowel letter as a cue to the lax vowel symbol for that target vowel. The shape of the vowel letter and the shape of the vowel symbol are easy to associate. For both tense and lax vowels, the letter *y* has the same value as the letter *i*.

Tense is in the name of the letter.

a = /ey/
e = /iy/
i = /ay/
y = /ay/
o = /ow/
u = /uw/

Lax is in the shape of the letter.

a = /æ/
e = /ɛ/
i = /ɪ/
y = /ɪ/
o = /ɑ~ɔ/
u = /ʌ/

If a pattern predicts a reduced vowel (not illustrated here), the translator converts it directly to /ə/ if the vowel spelling is *a, o, u*, to either /ə/ or /ɪ/ if the vowel spelling is *e, i, y*, or to /ər/ if *r* follows the vowel.

These stress and vowel quality rules conform to standards for good rule writing: Each stress rule applies to other unambiguously defined word groups. For each word, locating

its Key and Left Syllables is a mechanical process. The learner need not know the meaning, morphological derivation, or pronunciation of a word in order to judge which stress rule applies. The rules predict the major stress and the quality of the major stressed vowel in these word sets with an accuracy greater than 95%. VQPs make use of the stressing information, namely, the Key and Left Syllables—a valuable redundancy. Furthermore, each is stated in a template-like form that is easy to use and to practice. Finally, the Name-Shape Translator uses mnemonically transparent associations.

Rule Learning and Spontaneous Speech

For any new pedagogical goal to flourish, it must have the support of an accepted learning model. For prediction, that model comes from learning strategy research (Cohen & Macaro, 2007). One implementation is called *covert rehearsal* (Dickerson, 1984, 2000).

Since our brain cannot easily attend to the flow of our conversation and also analyze our performance as we converse, covert rehearsal is done in private, where we can speak aloud without self-consciousness and engage in rule use without distraction. Covert rehearsal is a recursive sequence consisting of the following steps (Dickerson, 2000). Although the first is not a strategy, the remaining steps are based on learning strategies (Sardegna, 2009).

1. Find privacy.
2. Perform aloud.
3. Monitor performance.
4. Compare performance with models.
5. Change performance to match models.
6. Practice changed performance aloud until fluent.

There is nothing novel in the claim that practice results in learning. The novelty of covert rehearsal is that the practice is not public and is initiated by the learner. Furthermore, the learner is the monitor and the source of correction. As in any other strategy training, learners can be taught these steps and encouraged to incorporate them into their learning.

Teaching and Testing the 3Ps

When pronunciation teaching expands to accommodate the goal of prediction, it has a major impact on instruction. It affects the following.

- Our learning objectives. Production now requires mastery and use of rules for private practice.
- Our understanding of the teachers' and learners' roles. It is the teacher's job to prepare learners to be self-teachers, because they are responsible for their own improvement.
- Our use of in-class and out-of-class time. To safeguard class time for oral work and feedback, rule learning can be moved to out-of-class time, where well-designed materials can help learners master each new rule and integrate it with old rules.
- Our teaching practices aimed at modeling covert rehearsal and encouraging rule use. For example, in class, before calling on learners to speak, teachers can direct them to practice utterances aloud in their own space, examining them for accuracy, repairing them, and practicing their repairs. When they make mistakes, instead of correcting them, teachers can guide learners to inspect their utterances and self-correct. Out of class, learners can be encouraged to link prediction and production by immediately reading

aloud the words or phrases for which they have made predictions. Teachers can also require students to make audio recordings of their exercise materials and to rehearse aloud before they record. These techniques build up learners' skill at using rules in covert rehearsal.

- Our testing. While perception and production tests remain unchanged, the testing of prediction is different in that we want to know the rule resources learners can marshal consciously for the tasks of monitoring and correcting their speech. For this, pencil-and-paper tests on novel words, phrases, dialogues, and passages allow learners to demonstrate their knowledge of rules.

Choices

The prerequisites for incorporating the goal of prediction into a pronunciation class or into the pronunciation part of a lesson are in place—a well-tested set of learner rules, an understanding of how to convert learned rules into acquired rules, and pedagogical materials and practices for teaching the rules and teaching learners how to use the rules in self-instruction. Teachers now have a choice of continuing with 2P instruction, trying 3P instruction, or fashioning a hybrid of the two because any amount of rule use gives learners a distinct advantage.

Prescriptive and Descriptive Grammar

SÖLVE OHLANDER

Introduction

The terms *prescriptive* and *descriptive* grammar contrast two approaches to grammatical phenomena. A prescriptive (or *normative*) attitude, *prescriptivism*, implies that “one variety of language has an inherently higher value than others, and that this ought to be imposed on the whole of the speech community” (Crystal, 1992, p. 312). This view, then, is that of a guardian or legislator of what is assumed to be correct grammar, typically formulated in terms of “dos” (*prescriptive* rules) and “don’ts” (*proscriptive* rules), in the name of good usage. Well-known English examples of prescriptive grammar are the rules “Don’t split infinitives!” (as in *to boldly go*) and “Don’t end a sentence with a preposition!” (as in *Who did you speak to?*). The prescriptive traditions of other languages may differ in content, although not in attitude.

A different approach was advocated by, for example, Jespersen (1933, pp. 19–20), that is, “a purely *descriptive* grammar which, instead of serving as a guide to what should be said or written, aims at finding out what is actually said and written . . .” This means that the linguist’s job is to record and describe language as it is, without trying to improve it according to some preconceived standard of correctness (e.g., “Don’t split infinitives!”). The emergence of descriptive grammar is closely related to that of modern descriptive linguistics in the first few decades of the 20th century, in which the Swiss linguist Ferdinand de Saussure and the American Franz Boas played pioneering roles. Descriptive linguistics, however, is a considerably wider notion (see Gleason, 1961).

Descriptive grammar deals with the grammatical system at large, prescriptive grammar with a narrow subset of phenomena, especially those displaying divided usage. Descriptivism has long provided the norm for scholarly grammars, such as Quirk, Greenbaum, Leech, and Svartvik (1985), and Huddleston and Pullum (2002), where the notion of rule—in the sense of “generalization”—differs from prescriptive rules. Sweet (1891, p. 5) insists that “the rules of grammar have no value except as statements of facts: whatever is in general use in a language is for that very reason grammatically correct.” For example, the descriptive grammarian should account for the fact that *It was me* (rather than *It was I*) is in general use and thus grammatically correct, whereas a prescriptive rule might condemn this usage. The focus of prescriptive grammar is on right versus wrong in more or less absolute, static terms, usually based on the written language in a fairly formal register, often with a literary bias. Descriptive grammar, by contrast, is sensitive to language variation and change, and considers appropriateness in relation to different social settings, registers and styles.

Historical Outline

The descriptive–prescriptive dichotomy can hardly boast a very long history, certainly not in comparison with linguistics or language teaching (Kelly, 1969; Robins, 1979). The term “prescriptive” applied to English grammar has been in use only since the 1930s (Crystal, 2006, p. 94); the normative approach itself dates back to the 18th century. In an international

historical context, despite the fact that the modern distinction was not explicitly formulated, the prescriptive tradition can be traced back to the Greek and Latin grammarians of classical antiquity, who also provided a descriptive framework for Renaissance grammarians; outside Europe, the early Indian grammatical tradition was essentially descriptive (Lyons, 1968, pp. 10–20).

In 17th- and 18th-century England, the Latin-inspired tradition was adopted by many grammarians, often having foreign learners of English as their intended readership. The degree of dependence on the Latin model varied: the dramatist Ben Jonson's posthumously published grammar (1640) conformed closely to it, whereas John Wallis's grammar (1653), although written in Latin, deviated substantially.

Among the numerous works on English grammar published in the latter half of the 18th century, Robert Lowth's *A Short Introduction to English Grammar* (1762) stands out as the starting-point of what, in retrospect, might be called the prescriptive movement. There had been earlier signs of prescriptive attitudes, particularly in connection with the lively debate, in the 17th and early 18th century, on the need to "fix" the language, (see Howatt, 1984, p. 109) protecting it from change and corruption. In this debate, in which writers like Daniel Defoe and Jonathan Swift participated, the notion of "correctness" loomed especially large.

While Lowth may be considered the instigator of the prescriptive approach to English, the American-born Lindley Murray, whose grammar (1795) was heavily dependent on Lowth's, was his prophet. Together—not sparing even great writers like Shakespeare, Milton, and Swift from rebukes for "false syntax"—they set the pattern for the traditional school grammars of the 19th century, defining a core of usage controversies and codifying the rules of correct grammar. This prescriptive canon lives on in many of today's usage handbooks, as well as on the Internet; "the same issues that bug people now were bugging them 250 years ago" (Crystal, 2006, p. viii).

However, dissenting voices were heard from early on, arguing for a more descriptive approach, based on "custom"; one of them was the scientist Joseph Priestley in his grammar of 1761. Interestingly, even Lowth, having first defined grammar as "the Art of rightly expressing our thoughts by Words," stresses that a grammar of English should be based on "the established usage and custom of it" (Lowth, 1762, p. 1). Apparently, his use of the phrase "established usage" has little in common with Sweet's descriptive view of "general use" (see above).

In the closing decades of the 19th century, methods of teaching languages, including prescriptive grammar, came under increasing fire from linguists (Sweet, Jespersen, and others) within the so-called Reform Movement with its emphasis on pronunciation and spoken language, whole texts rather than separate sentences, and inductive grammar teaching, starting from examples rather than rules (Howatt, 1984, pp. 171–91). Practical language skills rather than knowledge of grammar rules were gradually taking center stage. However, prescriptivist attitudes among pedagogical grammarians as well as the educated public were not easily abandoned, as shown by the success of H. W. Fowler's *Modern English Usage* (1st ed. 1926). This "epoch-making book . . . made the name of Fowler a household word in all English-speaking countries" (Gowers, 1965, p. iii). Despite objections from linguists, Fowler's reputation in the 20th century as *the* authority on English usage says a great deal about the enduring appeal of prescriptivist attitudes to grammar and usage.

Prescriptivist Principles

Underlying descriptivism is the scientific idea of observing and describing reality as accurately as possible. Prescriptive grammar, by contrast, derives its authority from what are

ultimately social and moral considerations. The grammars by Lindley Murray (1795) and William Cobbett (1819) can be seen as connecting the social and linguistic dimensions of English society, emphasizing the importance of high linguistic standards as a mark of high social status, as well as the role of such standards in promoting upward social mobility (Robins, 1979, p. 123). Thus, prescriptive grammar had—and still has—a social agenda: “Prescriptive rules are often social rules that are believed to mark out a speaker or writer as educated or as belonging to a particular social class” (Carter & McCarthy, 2006, p. 6). Further, for Jonathan Swift (and many other people), “the correct use of language was a moral issue,” it being “a moral duty to stem the tide of corruption and degeneration in order to restore the old values” (Howatt, 1984, p. 109). The rationale behind such views is a conception of language change as decay (see Aitchison, 1991).

A closely related idea is that of a Golden Age of language “purity.” Purist concerns have, from the start, played a central role in prescriptive argumentation, not only concerning English. This is clear from the following statement by Palmer (1939, p. xxxiv): “One of the most widely diffused of the many linguistic illusions current in the world is the belief that each language possesses a ‘pure’ or ‘grammatical’ form, a form which is intrinsically ‘correct,’ which is independent of usage, which exists, which has always existed, but which is now in danger of losing its existence” (cf. Aitchison, 1991, pp. 7–13).

Apart from subscribing to purist “illusions,” prescriptive grammarians have often been accused of indulging in rules of a subjective and arbitrary nature, especially where normative pronouncements simply reflect what Huddleston and Pullum (2002, p. 7) call “taste tyranny” or “aesthetic authoritarianism.” A different, sociolinguistic kind of bias resides in the view that formal written language should constitute the norm for standard English, thus “confusing informal style with ungrammaticality” (Huddleston & Pullum, 2002, p. 8).

Some of the arguments used by prescriptivists may be seen as attempts to ground rules in external principles, intended to enhance their authority. One type of criterion consists of appeals to Latin grammar. The prescriptivist aversion to sentence-final prepositions (*Who did you speak to?*), impossible in Latin, is a case in point, deriving from the notion that Latin and English should adhere to the same syntactic rules; conformity to the Latin model also underlies the rejection of *It was me* in favor of *It was I*. Another well-known criterion is formal logic, exploited to condemn cases like *She didn’t say nothing*, featuring the (non-standard) double negative construction. Lowth’s formulation to the effect that two negatives cancel each other out, being equal to an affirmative, was passed on, via Murray, to generations of English speakers. The underlying assumption is that logic and grammar are governed by the same rules. A third type of argument, with—prima facie—more linguistic credibility, builds on analogy. For example, the sentence *It’s clear who/whom they had in mind* may be compared to *They had me in mind*, where the accusative form *me* (versus the incorrect **I*) is supposed to prove the correctness of the accusative form *whom* as well (and, accordingly, the incorrectness of *who*)—on the grounds that there should be no difference in case marking between personal and interrogative pronouns (Huddleston & Pullum, 2002, p. 10).

Much of prescriptive grammar can be said to be fueled by a drive for clarity, simplicity, and consistency, supported by various arguments. In practice, this striving for a more orderly language often translates into an abhorrence of grammatical variation and change.

Relationship Between Descriptive and Prescriptive Grammar

At first sight, the difference between descriptive and prescriptive approaches may seem obvious. In reality, the relationship between them is rather less clear-cut. For one thing,

no prescriptive grammar, from Lowth onwards, is devoid of description. Also, as noted by Stern (1983, p. 123), “The native speaker’s judgement . . . constitutes the norm which must guide (and is therefore prescriptive for) the second language teacher and the second language learner.”

Today’s pedagogical grammars usually draw on descriptions provided by scholarly grammars; in this way, these descriptions will gradually filter down to language learners. Thus, even a purely descriptive, scholarly grammar will, by virtue of its authority, have *prescriptive implications*, via pedagogical grammars. It is difficult to envisage how things could be otherwise: pedagogical grammars are “inherently prescriptive, since their purpose is to tell students what to say and write” (Greenbaum, 1988, p. 34). The important thing, rather, is that the norms conveyed to the language learner should have a solid descriptive basis. The basic fault of traditional school grammars may not be their prescriptive orientation per se but their inadequate descriptive foundations (cf. Gleason, 1961, p. 209).

In other words, the relationship between descriptive and prescriptive grammar can be viewed in different ways: the *linguistic* relationship between language data and a grammar should be *descriptive*; the *pedagogical* relationship between a grammar and a language learner is necessarily *prescriptive*. Further, the prescriptive effect of descriptive scholarly grammars is strengthened by the fact that such grammars tend to describe the standard, most prestigious, variety.

Remnants—or reminders—of prescriptive rules are also to be found in scholarly grammars. For example, Quirk, Greenbaum, Leech, and Svartvik (1985, p. 14) “occasionally refer to the prescriptive tradition . . . because it may affect attitudes towards particular uses that may in turn influence the preferences of some native speakers”; the social dimension of prescriptive rules may impact on usage choices. From a pedagogical perspective, Carter and McCarthy (2006, p. 6) argue that it is “important that learners are aware of the social importance which attaches to certain prescriptive rules while at the same time being aware of the way in which English is used by real speakers and writers of the language.”

Some Further Perspectives

For linguists, usage determines grammatical correctness. For most other people, “correctness is not to be determined by majority usage . . . It is assumed to be somehow immanent in language and known by those who speak with authority on the language” (Greenbaum, 1988, p. 33). Linguists are often accused of being too permissive, while ordinary language users’ feelings of linguistic insecurity or inferiority—“I can’t speak proper English”—are exploited by usage manuals. In many cases, however, the judges of usage are “self-appointed authorities who . . . often disagree” (Quirk, Greenbaum, Leech, & Svartvik, 1985, p. 14). It may well be asked, therefore, why usage issues should be left to amateurs rather than to professional, linguistically trained grammarians (Greenbaum, 1988, p. 35). Recent years have seen some signs that this situation may be changing.

Despite its lingering shadows, the prospects of old-style prescriptive grammar are looking dim. Among linguists, the Lowth/Murray/Fowler kind of approach was never an option. In British schools, prescriptive grammar started losing ground in the mid-20th century (Crystal, 2006, pp. 196–203). Further, any large-scale comeback of prescriptive grammar is extremely unlikely in view of all the “new Englishes” in various parts of the world, as well as the present status of English as the world’s lingua franca. In short, the odds are heavily against the imposition of a unified norm of the kind that emerged under completely different circumstances in the 18th century; even a notion like standard English is no longer beyond question. On the other hand, prescriptivism may turn up in new areas of language use, in different guises.

With regard to norms of appropriateness, rather than correctness, a softer kind of prescriptivism may be seen, especially within the field of language for specific purposes (LSP), where descriptions of different registers, styles, and genres form the basis for recommendations on how to produce contextually appropriate language; academic language is a case in point (see Carter & McCarthy, 2006, pp. 140–54). Usage variation, as opposed to classical prescriptive grammar, is no longer a question of right or wrong. At the same time, a more rigid attitude, insensitive to context, is discernible in the crude grammar checkers supplied in computer programs, telling writers, among other things, to avoid passive constructions.

Another area where prescriptive attitudes are in evidence is that of language maintenance and planning, where the main intention is the preservation or establishment of desirable usage norms; in fact, much of the prescriptive tradition could be called a misguided kind of language planning. Prescriptive attitudes are perhaps most noticeable in vocabulary, where the idea of political correctness has had lexical repercussions in relation to, especially, gender, race, and ethnicity. In a few cases, however, grammar has also been involved, for example concerning the choice of personal pronoun in sentences like *If anyone calls, tell them/him or her I'll be home by ten*, to be contrasted with . . . *tell him* . . . , now advised against on grounds of linguistic sexism. Political rather than grammatical correctness has here become the basis of new prescriptive rules: certainly food for thought in a prescriptive context.

Prestige Planning

ULRICH AMMON

Prestige planning has received little attention from language planners and, to the extent that it has, it has been impeded by lack of clarity, even on basic concepts. In sociology, “prestige” and “stigma” are often opposite concepts in the rough sense of “attributed positive value” (or “esteem”) and “attributed negative value” (or “disdain”), with neutral evaluation in between. The term “low prestige” can be ambiguous in that it can mean either “low positive evaluation” (above the range of stigma) or “negative evaluation” (within the range of stigma). The scale stretching from “(high) prestige” down to “(strong) stigma” can be used for imprecise verbal comparisons (x carries higher prestige or stronger stigma than y) or can—in principle, though with remaining caveats—be metricized (Wegener, 1992, pp. 269–71; see the entire text also for different concepts and different theoretical foundations of “prestige” in sociology). One could then specify by how many degrees x’s prestige is higher or x’s stigma is stronger than y’s. The following entry, however, will not deal with details of measuring prestige, and will use the term “prestige” to refer to the entire scale of “prestige–stigma.”

Prestige is attributed to human beings—individuals or groups—or to things or features owned by human beings, such as certain professions, social roles, skills, behaviors, habits (here language comes in), or other possessions. Human beings or their possessions are therefore the *carriers of prestige*. It even seems that the possessions are the *direct* carriers of prestige and bestow prestige on human beings who own them, who would then be only *indirect* carriers of prestige. The process can be transitional, however: Once human beings have acquired prestige (through their possessions), they can bestow it on certain features or things they possess—as long as these remain somewhat exclusive. Prestige has its base in the attitudes of those individuals who attribute it, and can therefore be assessed by methods of attitude measurement (Garrett, 2005).

In language planning, the most important carriers of prestige are (a) the linguistic and sociolinguistic features selected or constructed in the planning process, in other words the *contents of language planning*, and (b) the *language planners* themselves. But prestige is also an aspect to be heeded with respect to (c) the individuals or groups for whom the planning is designed, in other words the targeted *subjects of language planning*. (The term “subject,” from norm theory [see von Wright, 1963, p. 77], captures the intended meaning better than terms more common in language planning like “people,” for instance [as in Kaplan & Baldauf, 1997, p. 56, who follow Cooper, 1989].) The prestige of the contents of planning and of the planners themselves can be decisive for the acceptance of the contents of planning by the subjects of planning. But the order of acceptance among the subjects of planning can also be crucial. It seems particularly important that the most prestigious individuals or groups among the subjects of planning adopt the contents of planning, that is, not only support it rhetorically, but take possession of it and use it regularly. They usually function as role models whose choices and behaviors the other subjects of planning follow. Cases in point are some postcolonial countries where the national elites propagated the—often newly standardized or modernized—indigenous language, yet did not adopt it themselves, but continued to use the colonial language. This was certainly one of the reasons why the new language could not be established for the functions for which it was

planned. An example is India, where Hindi could not replace English as the sole national official language, though the Constitution of 1950 decreed this should be achieved by 1965. One reason among others was probably that the Indian elites, notably long-term president Jawaharlal Nehru, remained somewhat indecisive and continued to use English for the most prestigious functions (King, 1997, pp. 125–36), which might well have been better for the country. By contrast, the full adoption and use of Swahili by the governing elite of Tanzania, notably long-term president Julius Nyerere, most likely contributed to its firm establishment as an official language of the country together with English (Coulmas, 1985, pp. 135–6). It should be added that gauging the weight of the prestige factor is often close to impossible, as is the precise evaluation of the outcome as ultimately for the good or for the bad of the country. (For other aspects of the importance of elites in language planning, see Kaplan & Baldauf, 1997, pp. 199–201.)

What constitutes the prestige of the language planners? It seems most important that the subjects of planning believe them to be competent in their field (i.e. in matters of language) and to have authority. These features mostly coincide, but not always, as planners can appear to be authorized (by a higher authority) but not fully competent, or, inversely, not to be authorized but to be fully competent. Thus in the case of the German spelling reform of the 1990s, the competence of the planners, mostly linguists, who had been publicly authorized by the German government, was challenged by renowned literary authors, who for example denigrated them publicly as “sogenannte Fachleute” (“so-called experts”) in the influential magazine *Der Spiegel* (“Schwachsinn Rechtschreibreform,” 1996, p. 262). This undermined the planners’ prestige, which exacerbated problems with acceptance of the reform. Therefore, language planning should seek to combine, as perfectly as possible, authority with competence in the choice of planners. Both features contribute to the prestige of planners, as do perhaps other attributes like the planners’ social standing, for instance as members of “prestigious” professional groups, or their prominence in public life. In the case of language academies, these conditions were often met to a considerable extent when renowned scholars or writers were authorized as the planning staff by the highest authority of the state: the sovereign (see Cooper, 1989, pp. 3–11 on the Académie française).

As these explications suggest, “acceptance planning” might be a possible alternative term for “prestige planning,” but would highlight somewhat different aspects. Ager proposed the further distinction between “prestige planning” and “image planning,” and related the latter to identity: “The identity, of the speakers of a language, is how they see themselves [. . .] The term *image* reflects this identity, in the same way that prestige reflects status.” Ager is of the opinion that both image and prestige are more attitudinal and therefore “less tangible” than identity and status, but that the former are often not clearly distinguished from the latter. Being “attitudes,” they “can be affected by propaganda,” which, he believes, is one way of improving a language’s image, since promoting a language can improve the self-image of speakers. Planners should also be aware of the possibility that the image of a language, as well as its prestige, can be perceived differently from inside and from outside the respective group (Ager, 2005a, pp. 1041–3; see also Ager, 2005b).

In spite of all the potential specificity of image planning, prestige is of particular importance for language-planning content. It relates to practically all the potential goals of language planning (on goals, see e.g., Nahir, 1984) or its major components, which have come to be classified as the planning of *corpus*, *status*, and *acquisition* (Kloss, 1969, distinguished *corpus planning* from *status planning*, which Haugen, e.g., 1987, elaborated on, and to which Cooper, 1989, pp. 33, 157–63, added *acquisition planning*). Corpus planning focuses on linguistic structures in the wide sense (selection or construction of writing system, orthography, grammar, syntax, forms of texts, and speech acts), status planning on use

and legal foundation of use in domains (i.e., types of situation), and acquisition planning on institutions, curricula, and methods of teaching and learning.

But how exactly should prestige planning interact with these three well-established components of language planning? Haarmann, who introduced the term (first in German: *Prestigeplanung*, 1984), seems to view prestige planning as an additional component equivalent to, and of the same rank as, corpus and status planning, not yet taking into account Cooper's acquisition planning, whose book he does not mention in his references (Haarmann, 1990, especially p. 105). Kaplan and Baldauf (1997, pp. 50–1) seemingly endorse this view. It indeed appears plausible in the face of the truism that corpus and status planning have to be neatly adjusted to each other to make a plan work. Similarly, questions of prestige have to be considered for each detail of corpus and status planning, and probably also of acquisition planning, which would warrant viewing prestige planning as an equivalent third or, respectively, fourth component. Yet its relevance extends, as shown above, even further, namely to the choice of planners, and it may also relate to the other three components differently than they do to each other.

This could, however, depend on how prestige planning is conceived. Haarmann (1990) and Kaplan and Baldauf (1997) seem to align it with promotional activities for the content of planning (similar to Ager's "propaganda" above), though they are not entirely explicit about the relationship. They also suggest a hierarchical order of such efforts according to the social rank of agents (i.e., planners or authorities of planning)—from (a) government (highest order) via (b) agencies or organizations, (c) groups, down to (d) individuals (lowest order)—and seem to assume that the rank of agents conveys the analogous rank of prestige to the content of planning (Kaplan & Baldauf, 1997, p. 50). Thus they give the following examples of such ranking with respect to corpus planning, for instance:

1. government: "the elaboration of writing systems [...] for new standard languages in the Soviet Union since the 1920s";
2. agencies: "the efforts to provide norms for the terminological modernization of national languages in Nordic countries [in recent years!];"
3. groups: "the attempts to elaborate a written standard for modern Occitan, made by [...] the movement of the *Félibre* since its foundation in 1854 [in France!];"
4. individuals: "the efforts made by J. H. Campe [...] and others in connection with language purism [...] in Germany [in the 18th and 19th centuries!]" (Kaplan & Baldauf, 1997, p. 51).

This, however, provides only a rough frame of orientation, because prestige can vary widely between individuals, between groups, and so on, based on the assumption that the prestige of planners or authorities of planning gets, at least to some extent, transferred to the content of planning, which makes it more or less desirable for acquisition and use by the subjects of planning. Another rough frame of orientation can be deduced from the distinction between high domains (government, parliament, law courts, educational institutions) and low domains (family, peers), which transfer higher or lower prestige to the languages or varieties commonly used there. Yet sociolinguistics has at its disposal more subtle distinctions and explanations of the sources of prestige. Even the doyens of the discipline supply promising hints, like Weinreich (1974, p. 79) who writes: "The value of a language in social advance might be designated *prestige*," from which it would follow that it is not so much the prestige of planners nor even the domains of use which bestow prestige on linguistic features, but their instrumentality for social advance or rather the assumption of such instrumentality by the subjects of planning. However, Weinreich (1974, p. 79, n. 36) cautions that there is the possibility of "multiple prestige rating," that is "a hierarchical order [of prestige!] derived from several mutually irreducible sources." Kloss

(1969, pp. 143–4) refers to four potential sources of prestige of a language or variety: “rich literary heritage, high degree of language modernization, considerable international standing, or the prestige of its speakers.” From this it would follow that, for example, winning over prestigious writers for a language or language variety would be an effective means to boost its prestige and, therefore, a valid goal of prestige planning.

Weinreich’s instrumentality for social advance would be an additional source, not necessarily identical to any of the four named by Kloss. It is easy to see that these sources can occur in different combinations and be further diversified, and can thus bestow different levels and kinds of prestige on linguistic features. Thus, a modern language of international standing may be preferred for business while a classical language is preferred for religious purposes, the two languages consequently symbolizing wealth and theological erudition respectively. Just think of Standard English versus Classical Arabic, a pairing which will in some societies be associated with economic privileges versus Muslim priesthood.

A typology of languages and varieties according to status and function can therefore serve as a framework for indicating prestige differences and is, in fact, implicit in most actual prestige planning (see, e.g., Hult, 2005, for Sweden’s attempt at propping up Swedish vis-à-vis English in Sweden). Kaplan and Baldauf (1997, pp. 14–27, overview p. 15) offer such a typology conceived from different viewpoints, such as political (language of wider communication, pan-regional, national languages, official, literary, regional, and religious languages), social (educational, majority, first, second, creole/pidgin, foreign, vernacular, and classical languages), educational (foreign, second languages, mother tongue, non-standard varieties, community and heritage languages), and popular; although the latter hardly provides a sound basis for planning, it can be important for communication with the subjects of planning and for implementation. For more precise definitions and possible operationalizations of such status types of languages and varieties, see Ammon (1989).

Prestige planning needs close attunement to status planning. The two components are not always easily kept apart, as prestige planners are inclined toward intertwining them for a language, for instance “increasing its status and hence its prestige” (Sallabank, 2008, p. 128). It seems clear however, that prestige planning has to take into consideration the status that linguistic features already have at the outset of planning and which has a bearing on their prestige, as well as their planned status. Thus, a variety which is planned for use in science, for example in an attempt to nationalize scientific education, needs a different kind of prestige from a variety to be introduced in the family domain or even only for token usage in endeavors of language maintenance or revival (on the latter see, e.g., Sallabank, 2008). Language planners should also be aware of the possibility of the same variety having divergent prestige for different groups within the same society, for example for women as compared to men (see, e.g., Gordon, 1997) or for lower-class versus upper-class males. The lack of awareness of such differences especially in mainstream society has been highlighted terminologically by distinguishing “covert” from “overt” prestige (Trudgill, 1972).

Priming Research

PAVEL TROFIMOVICH AND KIM MCDONOUGH

What Is Priming?

Priming methods are one of the predominant experimental paradigms employed to study cognitive aspects of language learning and use. Priming methods originated in psycholinguistics, but have become increasingly common in applied linguistics over the past two decades. For example, a search in the *PsychInfo* abstract database for the period 2001 to 2010 yields 125 citations for studies investigating priming in second language (L2) learners or bilinguals, a nearly 150% increase from the number of studies (53) published on the same topic between 1991 and 2000. The term “priming” refers to the phenomenon in which prior exposure to specific language forms or meanings either facilitates or interferes with a speaker’s subsequent language comprehension or production. Priming is believed to be an implicit process that occurs with little awareness, and this implicit nature makes priming one manifestation of a larger system of human memory—implicit memory. Briefly, implicit memory involves memory for cognitive operations or procedures which are learned through repeated use, and includes memory for skills and habits, as well as priming. As an implicit cognitive phenomenon, priming suggests that language users’ prior experience with language shapes their subsequent language use, which is often interpreted as a form of implicit learning.

Although the term “priming” describes all situations in which prior language exposure influences subsequent language processing, different types of priming have been defined in the literature (McDonough & Trofimovich, 2008). For example, language users will access the meaning of the word *cat* more quickly if they recently read the word *dog* as opposed to an unrelated word, such as *shoe*. By activating the meaning of *dog* in comprehension or production, speakers more quickly activate the meaning of *cat* due to the shared meaning between the two. This kind of priming is called “semantic priming,” and it describes the tendency for speakers to process a word more quickly and/or more accurately when they have been previously exposed to a word related in meaning. In an example of a different kind of priming, if a speaker uses a prepositional dative, such as *my husband gave our lawnmower to the neighbor*, later in the conversation her interlocutor is likely to produce another prepositional dative (*my daughter sent a birthday card to her grandmother*) rather than a double-object dative (*my daughter sent her grandmother a birthday card*). This type of priming is called “syntactic priming” because it refers to the tendency for speakers to produce a syntactic structure that appeared in the recent discourse, as opposed to an equally acceptable alternative.

Historical Discussion

One of the first observations of priming as a phenomenon is attributed to James Cattell (1860–1944), an American psychologist who between 1883 and 1886 worked in Wilhelm Wundt’s psychological laboratory in Leipzig, Germany. Cattell’s time in Germany coincided with what has been called the golden age of the chronometric approach to the study of

2 PRIMING RESEARCH

the human mind (Meyer, Osman, Irwin, & Yantis, 1988). The chronometric approach relies on the use of reaction times (response latencies) to study various mental processes, including language comprehension and production. While in Leipzig, Cattell conducted numerous experiments of this kind, examining the speed with which people reacted to letters, words, and sentences in their first language (L1) and their L2. In one experiment, Cattell (1885/1947) discovered that it takes people about twice as long to read words that are semantically unrelated as to read words in a sentence. This demonstration suggested that a meaningful context has a facilitatory effect on the processing of individual words.

It appears that the term “priming” was first used by Feldman and Weld (1939), who defined it as a state of attentional preparedness for perception (e.g., the decision to wake up early increases the likelihood that the alarm will be heard), and later by Lashley (1951), who used it to describe internal activation or readiness of linguistic elements in speech production (i.e., preparing a structural configuration of an utterance before producing it). However, in the sense we use it now, the term “priming” did not become mainstream until the early 1960s, when Segal and Cofer (1960) published a study which replicated and extended an earlier experiment by Storms (1958). Segal and Cofer demonstrated that when language users are exposed to a list of words, they are more likely to reuse these words to perform a subsequent task. Segal and Cofer referred to this phenomenon as priming. Since then, priming has been used as an experimental technique to address many interesting questions about how languages are organized in the human mind, and how people learn them. Examples of such questions could be found in seminal early investigations by Meyer and Schvaneveldt (1971) on semantic priming and by Bock (1986) on syntactic priming, and in recent reviews of priming literature by McNamara (2005), McDonough and Trofimovich (2008), and Pickering and Ferreira (2008). Beyond the study of language, examples of priming research in the wider context of cognitive psychology can be found in edited volumes by Bowers and Marsolek (2003), and Kinoshita and Lupker (2003).

The history of priming research is closely tied to the development of instruments that have allowed researchers to present different kinds of language materials to participants and to measure their responses to these materials. For example, Cattell used a gravity chronometer to present language materials (e.g., letters or words) to participants. The gravity chronometer was an early version of a tachistoscope, an instrument which was used for over 100 years in psycholinguistic research to present visual stimuli to participants rapidly, for a given amount of time (Benschop, 1998). The Cattell version of the gravity chronometer featured an electromagnet controlling a screen; when the electric current flowing through the spiral of the electromagnet was broken, the screen would fall and would reveal an object to be seen by the participant (for example, a card with a word written on it). To record participants' reaction times, Cattell used another sophisticated device of the day—a Hipp chronoscope (depicted in Cattell, 1886). The chronoscope was an electromechanically controlled timer which allowed researchers to record reaction times with millisecond accuracy when participants pressed a telegraphic key or even when they simply spoke in response to a stimulus (Benschop & Draaisma, 2000; Schmidgen, 2005).

Yet another early technological invention used in psycholinguistic research was a memory drum. This device consisted of a rotating kymograph drum which showed lists of words or sentences, or series of pictures for fixed intervals of time so that participants could view them and respond to them individually (Haupt, 2001). According to Haupt, the memory drum was the standard way of presenting language materials in research on memory and language for almost 100 years, from about the 1890s to approximately the mid-1970s, when affordable computers and monitors became available (Bailey & Polson, 1975). Over the past several decades, nearly all psycholinguistic research, including priming research, has been carried out by using powerful personal computers running multifunctional psychological software which allows researchers to present various kinds of stimuli

to participants (e.g., images, texts, audio, video) and to measure participants' reactions to these stimuli (e.g., in terms of accuracy, speed, duration). Examples of common psychological presentation software are E-prime (Schneider, Eschman, & Zuccolotto, 2002), DMDX (Forster & Forster, 2003), PsyScope (Cohen, MacWhinney, Flatt, & Provost, 1993), and SuperLab (Cedrus Corporation, 2008).

Main Findings

Although a comprehensive review of the priming literature would not be possible due to space limitations, we briefly outline several main strands of semantic and syntactic priming research, with a particular emphasis on L2 processing and learning. As was discussed earlier, semantic priming is defined as the tendency for language users to process a word more quickly and/or more accurately when they have been previously exposed to a word related in meaning. For example, the word *table* will be responded to faster if the word *chair* has been heard or seen recently. This suggests that semantically related words (like *table* and *chair*) are "stored" together or are somehow linked in the mind of a language user, and that both get activated by virtue of having such links.

In the last three decades, researchers have relied on semantic priming to explore the nature of semantic networks in the mental lexicons of L1 and L2 speakers. Some researchers have investigated whether L1 and L2 speakers differ in their patterns of semantic priming in a language (e.g., Freck-Mestre & Prince, 1997; Devitto & Burgess, 2004; for review, see McDonough & Trofimovich, 2008). For example, if L2 speakers do not show priming for word pairs like *table* and *chair*, while L1 speakers do, then this would indicate that L2 speakers store and access these words differently from L1 speakers. The findings from this strand of research indicate that L2 speakers, at least those who have reached a high level of proficiency, can access and use the semantic information as L1 speakers do. To give an example, Freck-Mestre and Prince (1997) found that the native English speakers and the more proficient French learners of English in their study showed semantic priming for semantically related words in English (e.g., *wet-dry*). In contrast, the less proficient learners did not.

Other researchers have used semantic priming to understand how bilinguals organize words in their two languages (e.g., Basnight-Brown & Altarriba, 2007; for review, see Altarriba & Basnight-Brown, 2007). For instance, if English-French bilinguals show semantic priming for word translations (e.g., *chien-dog* in French and English), then this would indicate that they organize the meanings of words in their two languages in a shared, interdependent manner. Results from this line of research are complex; they suggest that the manner in which bilinguals organize and access the meanings of words in their two languages depends on many factors, including the specific nature of words being examined (de Groot & Nas, 1991), bilinguals' proficiency in the two languages (Grainger & Beauvillain, 1988), and the age at which they start learning their L2 (Silverberg & Samuel, 2004). To illustrate, Silverberg and Samuel (2004) showed that only early, but not late, Spanish learners of English showed semantic priming for English-Spanish word pairs such as *nail* and *tornillo* ("screw" in Spanish). Because L2 words (like *nail*) facilitated the processing of L1 words (like *tornillo*) for the early learners, these learners appear to store the meanings of semantically related words across the two languages in a shared manner. In contrast, late learners appear to store such meanings separately.

As its name suggests, syntactic priming refers to the tendency for speakers to produce a syntactic structure that appeared in the recent discourse, as opposed to an equally acceptable alternative. For instance, speakers are more likely to produce a passive sentence if they recently heard a passive sentence or if they themselves produced one earlier in the

discourse. In fact, speakers tend to produce the recently encountered syntactic structure even if the initial and subsequent utterances do not have any of the same lexical items, phonological or prosodic properties, or shared semantic information. This implies that it is easier for speakers to access a syntactic structure that has been recently activated than to access a completely new structure, and that speakers tend to implicitly “fine tune” their use of syntactic structures in response to recent experience with language.

Similar to the semantic priming studies that explore how bilinguals organize their L1 and L2 lexicons, bilingual syntactic priming research has investigated how syntactic information is represented. One possibility is that bilinguals store L1 and L2 syntactic information separately, while another possibility is that at least some syntactic information used in both languages is shared. The separate-syntax account predicts that cross-language priming would not occur since activation of linguistic information in one language would not affect the linguistic information of the other language. However, the shared-syntax account predicts that cross-language priming would occur as activation of the syntactic structure in one language would facilitate production of the related structure in the other language. Cross-language syntactic priming research has demonstrated that syntactic priming occurs cross-linguistically, which supports the shared-syntax account (e.g., Hartsuiker, Pickering, & Veltkamp, 2004; Bernolet, Hartsuiker, & Pickering, 2007; Salamoura & Williams, 2007; Schoonbaert, Hartsuiker, & Pickering, 2007). Current research is exploring how L2 proficiency impacts the development and strength of shared syntactic representations.

Other researchers have explored the occurrence of syntactic priming in L2 speech production, which is within-language priming. The initial question asked in within-language L2 syntactic priming research was simply whether it occurred, as the previous research had been carried out with L1 speakers. Researchers initially focused on demonstrating that priming occurred in L2 speech production for a variety of structures, such as dative constructions (Gries, 2005; McDonough, 2006; Schoonbaert, Hartsuiker, & Pickering, 2007, Experiment 1), passives (Kim & McDonough, 2008), and alternation between adjective + noun phrases and relative clauses (Boenlel, Hartsuiker, & Pickering, 2007, Experiment 2). Subsequent studies have explored whether syntactic priming occurs with alternation between a developmentally advanced structure and an interlanguage form (McDonough & Mackey, 2008; McDonough & Kim, 2009). In this line of research, syntactic priming is being used to encourage L2 learners to produce the developmentally-advanced structures as opposed to the less advanced or non-targetlike forms.

Future Directions

There are several possible avenues of research which have yet to be explored using priming methods. With respect to semantic priming, it is important to investigate how L2 speakers access and use semantic information not only in comprehending and speaking individual words, but also in processing phrases, sentences, or longer units of discourse. Indeed, when listening or speaking, L1 speakers activate semantic information for several words simultaneously or near-simultaneously, and use this information in real time. Would L2 speakers also activate multiple sources of semantic information simultaneously when comprehending and producing sentences? How does the activation of semantic information unfold as L2 speakers comprehend or produce sentences in their two languages? (See Elston-Güttler & Friederici, 2005, for some preliminary answers.) It is also important to study how individual differences in L2 speakers’ cognitive abilities influence their use of semantic information. It is possible that individual difference factors, including the size of working memory or ability to efficiently allocate attention between processing tasks, might influence the particular kind of processing involved in semantic priming. Understanding

the influence of individual differences on semantic priming may clarify why some L2 speakers do not process and use semantic information efficiently, and may explain what kinds of experiences may be beneficial to help them do so.

With respect to syntactic priming, it would also be interesting to explore whether individual differences in working memory capacity and temporal auditory processing abilities might predispose L2 speakers to benefit, or not, from the implicit learning processes associated with syntactic priming. In particular, it would be useful to determine whether priming activities that provide different types of exposure and practice positively impact L2 speakers with specific aptitude profiles. Since the majority of syntactic priming research has targeted individual speakers or interaction between L2 speakers and scripted interlocutors, future syntactic priming research might explore whether it occurs in less-controlled interactions, such as when learners carry out pair and small-group activities in classroom contexts. Future research might also increase the methodological diversity of syntactic priming research by incorporating additional technological tools, such as eye-tracking systems (Arai, van Gompel, & Scheepers, 2007) and event-related potentials (Ledoux, Traxler, & Swaab, 2007), as a way to gain further insight into the impact of priming on speakers' mental representations.

Although some priming methods can be carried out with minimal use of technology, technological advances in neuropsychology may shape future priming research, just as Cattell pioneered technology to capture reaction times. For example, studies employing technologies such as positron-emission tomography (PET) and functional magnetic-resonance imaging (fMRI) have revealed that priming is associated with decreases in brain activity in parts of the visual cortex (involved in perceptual processing) and in some areas of the frontal lobe (involved in semantic and conceptual processing). Neuropsychological investigations of L2 priming may help answer questions about priming as an implicit learning phenomenon, and generate research that explores the pedagogical applications of priming.

Prison Language

ANDREA MAYR

The specific demands on language by a subgroup in society are often expressed through slang, and the use of slang by minority or deviant groups is well known. According to Maurer (1974), slang “emanates from conflicts in values, sometimes superficial, often fundamental. It expresses the attitudes . . . of one group or class toward the values of another” (p. 850). Prison slang illustrates this point very well. It reflects not only the values and attitudes of prisoners but also the conflicts and tensions inherent in the institutional setting. As Boroff (1951) has aptly put it, “it is the language of the dispossessed, tinged with bitterness and marked by a self-lacerating humour” (p. 190).

Mencken (1923/1947), who devotes an entire chapter to slang in *The American Language*, informs us that prison slang is drawn in part from underworld and general street slang, and bears the traces of an international criminal slang, often containing German, Hebrew, Italian, and Romany words. It has also been enriched by escaped convicts from Australia. Although slang was originally transported from England to the USA by professional criminals who were driven out of London by the Metropolitan Police in the early 19th century, by the beginning of the Civil War the American underworld had begun to create its own slang.

When the word “slang,” whose origin is uncertain, first appeared in the English language in the 18th century, it was used interchangeably with “cant” (from Latin *cantare* ‘to sing’) and later on “argot” (from French *argoter* ‘to quarrel’), both designating the sometimes secret special vocabulary of the low and disreputable classes of London. Cant and argot are differentiated from slang by the fact that they are spoken by relatively small and cohesive groups, and cant is separated from both argot and slang by the fact that one of its purposes is to deceive or mystify the outsider, although there is at the same time a constant movement of words and phrases from one category to another (Mencken, 1923/1947).

What constitutes “slang” is difficult to define and there is no consistency in dictionary definitions, although the following description in the *American Heritage Dictionary* is a useful starting point: The term slang indicates “a style of language,” whose main characteristic is to “produce rhetorical effect, such as incongruity, irreverence, or exaggeration” and which has “strong connotations in addition to its denotation,” which is “intentionally, often aggressively, informal” (Morris, 1969, p. xlv).

While nonspecialists often use the term for language they feel is not “good” formal English, the following criteria for “true” slang offered by Dumas and Lighter (1978, pp. 14–15) may be more helpful. Slang can be used to

1. signal that the user is “deliberately undignified” with the audience for rhetorical effect;
2. demonstrate “special familiarity” with a term and the “less statusful” class of people who use it;
3. express a form of linguistic defiance to persons of authority.

These criteria also apply to prison slang, as will be shown below.

Prison slang has long been a subject of particular interest. Lexicographers have compiled it in dictionaries (e.g., Grose, 1785; Partridge, 1937, 1949; Lighter, 1994; Green, 2011), as have prisoners (e.g., Bentley & Corbett, 1992; Kears, 2006); sociologists and criminologists

have used it as a “map of the inmate social system” (Sykes, 1958, p. 84; see also Wieder, 1974; Bondeson, 1989; Einat & Einat, 2000); and anthropologists and linguists have explored its communicative, social, and cultural functions (e.g., Fleisher, 1972; Halliday, 1978; Little, 1982; Encinas, 2001; Looser, 2004). Although mainly verbal, prison slang also exists in written form as “kites” (secret prison notes), graffiti, and tattoos (see Awofeso, 2002).

Some Characteristics of Prison Slang

Prison slang (which in the USA is more often known as “prison argot”) is a form of what Halliday (1978, p. 165) calls an “antilanguage,” a way of communicating developed by an “antisociety.” An antisociety is a society which is “set up within another society as a conscious alternative to it” and which is a form of resistance. The inmate subculture appears to represent precisely such an antisociety. Its social system together with its moral code provides its members with informal means to gain support, power, and status, thereby lessening “the pains of imprisonment” (Sykes, 1958). In the words of criminologists McCorkle and Korn (1954, p. 88),

the inmate social system may be viewed as providing a way of life which enables the inmate to avoid the devastating psychological effects of internalizing and converting social rejection into self-rejection. In effect, it permits the inmate to reject the rejectors rather than himself.

Halliday (1978, pp. 181–2) makes the following point about the language of prisoners:

The antilanguages of prison and criminal countercultures are the most clearly defined because they have specific reference to alternative social structures, as well as the additional attributes of secret languages and professional jargons; and hence they are full of overt markers of their antilanguage status.

Prison slang then can be said to enable prisoners to identify with each other and an alternative reality, and at the same time to reject the dominant reality and the values it stands for.

Antilanguages such as prison slang are characterized by “overlexicalization” (Halliday, 1978, p. 165), that is, the proliferation of concepts and expressions in areas of interest to the prison antisociety. For example, Devlin’s (1996) English prison-slang dictionary (compiled with the help of prisoners) lists 25 words for the police (e.g., *bluebottles*, *filth*, *bogey*); 32 for prison officers (e.g., *key*, *kanga(rou)*/*Scoobie-doo*—both rhyming slang for “screw”); 22 for informers (e.g., *midnight mass*—rhyming slang for “grass”; *bubble*—rhyming slang for “bubble and squeak,” i.e., “speak”; *grasshopper*—rhyming slang for “shopper”); 30 for sex offenders (e.g., *wolf*, *beast*, *bacon bonce*—rhyming slang for “nonce”); and 36 words for homosexuals (e.g., *bum bandit*, *bent*, *pillow biter*). Drug terms also feature prominently. Devlin lists 39 expressions for LSD (e.g., *Bart Simpsons*; *Lucy*—from the Beatles’ song *Lucy in the Sky with Diamonds*; *funky yellows*); 47 for ecstasy (e.g., *mints*, *Adam and Eves*, *love doves*); 21 for heroin (e.g., *Henry*, *fleapowder*, *gold dust*); and 28 for marijuana (e.g., *wacky backy*, *Thailand grass*, *Kate Bush*—“bush” being a common word for marijuana). Similarly, Bentley and Corbett (1992), two former prisoners at Arizona State Prison, record 25 words for prison officers (e.g., *boss*, *badge*, *bull*); 37 for serving time (e.g., *behind the iron door*, *dead time*, *hit the pit*); 37 for homosexuals (e.g., *butt slut*, *Cup Cakes*, *wolf*); 64 relating to violence (e.g., *scuff up*, i.e., fight; *srag*, i.e., kill; *sell wolf tickets*, i.e., threaten another inmate); and 78 for drugs and alcohol (e.g., *chocolate stuff*, i.e., Mexican heroin; *wacky backy*, i.e., marijuana; *scrap iron*, i.e., an intoxicating drink made from alcohol, mothballs and chlorine). The number of slang terms in each category can be assumed to reflect their

importance in prisoners' lives. For example, the high number of terms for informers reflects the strong negative sanctions applied for violation of one tenet of the code—never to inform on a fellow inmate. A more recent study of Israeli prison slang by Einat and Einat (2000) identifies roughly the same categories of importance, with many derogatory slang terms drawn from Arabic (e.g., *madroob*—crazy, i.e., a violent prisoner; *sharshuchot*—prostitutes, i.e., police/prison staff; *wiseh*—dirty, i.e., informer). The significance of some of these categories has changed over time. The first detailed sociological study from America to deal with prison slang, by Clemmer (1940), contains very few terms for drugs and alcohol, but shows that terms for homosexuality, prison experience, and crime were abundant even in those days.

As some of the above examples demonstrate, prison slang is also a relexicalized version of the mainstream language, that is, it is characterized by the creation of a rich vocabulary which often gives new meanings to already established words in the mainstream language rather than creating completely new words (e.g., *Scoobie-doo*, the name of a well-known American children's cartoon character—a dog—for "prison officer"). According to Maurer (1981), this is true of criminal subcultures in general.

Two complementary criminological models have been put forward to explain the prison subculture and its language. The *prisonization* or *indigenous model* (Clemmer, 1940; Sykes, 1958) postulates that both emerge as a result of prison conditions; the *importation model* (Irwin & Cressey, 1962), on the other hand, contends that prisoners bring a more general criminal code and slang into the prison. Studies have shown that prison slang is a mixture of indigenous creation and importation (e.g., Giallombardo, 1966; Einat & Einat, 2000; Kaminski, 2003).

Although prison slang, like any other slang, is ephemeral, some is also quite archaic. In Mayr's (1995) sociolinguistic study in a Glasgow prison, the inmates attest to their use of slang terms that have been employed for 100 years or more. *To cart* (to transfer to another prison for disciplinary reasons), for instance, dates back to 1733 and originally meant to hang after being transported in a cart to the place of execution; its synonym, *to shanghai*, goes back to 1855 and was originally US nautical slang for kidnapping sailors for compulsory service aboard ships sailing to Shanghai; *flowery dell* (rhyming slang for "prison cell") dates back to the late 19th century and is of Cockney origin; *lag* (prisoner) dates back to 1811 and is Australian and British slang, originally meaning either a transported convict or a three-year prison sentence; *chokey* (solitary confinement) goes back to 1873, from Hindi *chauki* (a shed or police station in India); *stiff(y)* (a secret letter/note passed from one prisoner to another) used to mean a document or bill of exchange and acquired its present meaning in the late 19th century; *chib* (a home-made knife, often a toothbrush with a razor blade in it) has been in use in Glasgow since 1930 and is said to be derived from Romany *chiv* 'a knife'. Among other things, this also confirms Mencken's findings about prison slang being partly international.

The Social Functions of Prison Slang

Prison commentators, including prisoners themselves, have attributed to prison slang such functions as expression of solidarity, identification of in-group members, exclusion of non-members, veiled expressions of hostility, and secrecy (Stephenson & Scarpitti, 1968). The theme of secrecy is prominent in many prisoners' accounts of slang. Kaminski (2003), a former political prisoner in a Polish prison, describes *grypsing* (from Polish *gryps* 'a secret prison letter'), a sophisticated secret behavioral and linguistic code, passed on by "grypsmen," the highest caste of prisoners, to selected "rookies." The secret or "little" languages named by prisoners in Cardozo-Freeman and Delorme's (1984) study include *Tut*, *Ceazarney*

or *Carney* (invented by carnival workers), *Agini*, *Bong-Song*, *Alfalfa*, and *Elephant*. These languages, which prisoners often bring in from the outside, are usually formed from known words by adding specific sounds or letters before or after a syllable or a whole word. For example in Tut, *mum-a-nun on the tut-ie-rak* means 'man on the tier', in other words 'a prison officer on the landing'. Prisoners in Mayr's (1995) study mention the use of back slang, Romany, and *egg language*, which functions according to the same principle of insertion (e.g., *Heggow eggare yeggou?* 'How are you?'). But, although secrecy may be "a necessary strategic property" (Halliday, 1978, p. 166) of prison slang, it is unlikely to be the main cause for its existence. One reason for this is that prison officers often get to know the meaning of slang terms and also use them to a degree (see Devlin, 1996; it should be noted that prison officers also have their own slang, sometimes referred to as *pig Latin* by prisoners—see Cardozo-Freeman & Delorme, 1984—although it so far has remained largely undocumented in the literature). Another reason is that many prison-slang terms eventually seep into the dominant language, and thereby turn into general urban slang. Therefore a more critical function of prison slang would be its importance for classifying inmates' experiences in terms which deal specifically with the major problems of prison life. It has even been called "reverse crying," a (male) prisoner-approved form of lament (Cardozo-Freeman & Delorme, 1984, p. 27). Sykes's (1958) study in an Illinois maximum-security prison identified certain behavioral patterns among the inmates which he named "argot roles," slang labels invented by inmates for social roles they played in response to their imprisonment. These were the *rat* or *squealer* (the prison informer), the *center man* (prisoner who sides with staff), the *gorilla* (prisoner who abuses weaker inmates), the *merchant* (prisoner who exploits inmates for financial gain), the *wolf* (the aggressive homosexual), the *punk* (the passive homosexual), the *fag* (the "born" homosexual), the *ball buster* (prisoner who is aggressive with prison officers), the *tough* (prisoner who is prone to violent outbursts), the *hipster* (the "wanna-be" tough gangster), and the *real man* (prisoner who endures his sentence with dignity and is therefore held in high esteem by his fellow inmates).

Most studies of prison slang have been conducted in adult male prisons, and prison slang is considered an essentially male antilanguage. One of the major early studies into female prison subcultures (Giallombardo, 1966) identified some similar but also some different argot roles for women. These were the *snitcher* (the female equivalent of the 'rat'), the *booster* (the female equivalent of the 'merchant'), the *chippie* (the prison prostitute), the *jive bitch* (troublemaker who breaks up relationships), the *stud broad* (female who adopts a male role), and the *femme* (female who adopts a traditionally female role), among others. The equivalents of the 'wolf', 'tough', 'hipster', 'ball buster' as well as the 'real man' were absent, which suggests a diminished importance of adherence to the convict code. The main difference Giallombardo found was that, whereas the men's conflicts centered on the struggle for power, the women's conflicts centered more on maintaining relationships. Also, the female inmate social system was not just a functional response to imprisonment as Sykes had suggested with male prisoners, but was shaped by the women's experiences in free society.

Many studies of prison slang have been concerned with *managing* prisoners (e.g., Stephenson & Scarpitti, 1968; Nielsen & Scarpitti, 1995) rather than *understanding* them. Prison-slang glossaries have therefore often been written for those in authority (see Coleman, 2004). More qualitatively based studies in the ethnomethodological tradition (some of which have been cited in this entry) are therefore an important corrective to these, starting with Clemmer's (1940) pioneering study, *The Prison Community*, which was based on over 30,000 conversations and interviews with prisoners and analyses of their written notes (*kites*), and which resulted in the collection of over 1,000 slang terms. A more recent, comparative semantic study of American prison slang in four states by Beckner (1995) found

evidence of both “regional” and interstate slang terms, offering an insight into American prison terms at the end of the 20th century. Another important study, Cardozo-Freeman and Delorme’s (1984) “folk-ethnography” in a Washington maximum-security prison, was based on Whorf’s hypothesis that language not only contains the worldview of a speech community, but also tends to *structure* its experience and behavior. The research, which was conducted mainly by the prisoners of the institution (one of whom was Delorme), aimed at bridging “the vast abyss of misunderstanding and lack of communication that exists between those who are imprisoned and those who imprison” (p. 19). Similarly, Einat and Einat’s (2000) investigation of prison slang in an Israeli long-term male prison concludes that it is mainly through an in-depth understanding of prisoners, their moral code, and their language that prison administrators can assess their distress and needs, and seek out coping strategies.

Conclusion

Prison-slang studies are both significant and valuable. Not only do they demonstrate the importance of language in helping prisoners to cope with their conditions of existence, they also help us to understand the social functions of language in general. What research has shown above all is that the inmate culture and its language have a strong influence on inmate behavior. A better understanding of prisoners’ acts might come about if prison staff and the criminal justice sector carefully analyze their language, as this information could be a first step in the prevention of violence in prisons. Those concerned with running prisons should therefore listen to what prisoners have to say about their situation. Prison reform also has to come from below.

Private Speech in Second Language Acquisition

MARÍA C. M. DE GUERRERO

Traditionally, the study of second language (L2) acquisition has focused on learners' use of speech for social or public purposes (as in writing for an audience or engaging in conversation). Lately, however, an increasing number of researchers have started to recognize the importance of speech that L2 learners quietly address to themselves, rather than to others. Speech that is self-directed and aimed at regulating oneself is known as private speech.

Research into private speech has been greatly influenced by Vygotsky's (1986) theories of mental development. Particularly appealing has been his well-known proposal that children develop speech through a process of internalization that involves a progression from *social speech* to *inner speech*, with a transitional stage he called *egocentric speech*. At this stage, speech ceases to be exclusively social and takes on a psychological dimension. Speech begins to serve the intellect and help the child in problem-solving, imaginary play, controlling behavior, and other mental operations. A preschool child, working alone and trying to solve an animal-home matching task, for example, mutters these words to guide his actions through the task: "put a bear inside the cage . . . no, no, put a kitty inside a cage and . . . put a bear . . . in the nest" (Patrick & Abravanel, 2000, p. 57). Egocentric speech is vocalized and can be heard by others (or captured by a tape recorder), but in orientation it is self-directed. Egocentric speech does not remain external, however. At some point, Vygotsky hypothesized, it goes inward as silent inner speech. Because of its importance in mental and linguistic development, the phase of egocentric speech—more commonly referred to as "private speech" in current literature—has generated great interest as an important window into language learning and use, both from a first language (L1) and an L2 perspective.

In L2 acquisition, private speech has been studied mainly from two perspectives: (1) as evidence of language learning in process, and (2) as a self-regulatory means of gaining control over mental tasks. Both perspectives have unveiled widespread use of private speech among L2 learners of all ages, language backgrounds, and proficiency levels. Some studies have been deliberately set up to elicit private speech (see, for instance, McCafferty, 1992); other studies have documented incidental private speech among L2 learners (see, for example, Smith, 2007). A large number of studies have observed vocalized (oral) private speech as it occurs in solitary or multiparty discourse; some research has looked into private speech as it manifests in writing and gesture. Roebuck (2000), for example, found private speech features—such as lexical word searches scribbled on the margins—in the written protocols of college learners of Spanish, whereas Negueruela, Lantolf, Jordan, and Gelabert (2004) detected semantic features associated with L1 thinking in some of the gestures of advanced English as a second language (ESL) learners. Private speech among L2 learners has been reported in the literature as taking place both spontaneously in natural classroom contexts (e.g., Ohta, 2001) and in experimental conditions deliberately created for research purposes (e.g., Centeno-Cortés & Jiménez, 2004).

2 PRIVATE SPEECH IN SECOND LANGUAGE ACQUISITION

Private speech among L2 learners has been shown to have a significant role in language learning. In Vygotskian sociocultural theory, this is known as the internalizing function of private speech; that is, private speech is seen as a useful mechanism for turning inwards L2 resources in the environment, and as a precursor of inner speech. A study by Saville-Troike (1988) conducted in the US has exposed the private speech activity in the L2 that typically goes on in L2 classrooms without teachers noticing. While outwardly “silent,” several preschool children of Chinese, Korean, and Japanese origin were found in this study to be highly active in talking to themselves in English, their L2. Microphones attached to their collars revealed the children engaged in L2 private speech for various purposes: to repeat utterances produced by the teacher or other classmates, to recall language heard before, to generate novel utterances with words they had acquired, to practice sentence patterns, and to rehearse speech before saying it aloud.

In these uses, private speech emerges as an important context for imitation, a process which—in Vygotskian theory—involves creative and intentional appropriation and reconstruction of models and is instrumental for internalization. As Lantolf and Thorne (2006) define it, imitation is “a potentially transformative process that entails selective attention resulting in reduction, expansion, and repetition of social models” (p. 179). In Saville-Troike’s study, children sometimes repeated to themselves phrases that were probably beyond their comprehension (for example, “Are you awesome?” p. 583), yet these instances of apparent “repetition for its own sake” (p. 583) denote capacity to focus selectively on language resources in the environment, an essential requirement for intelligent imitation. More complex processes of imitation were also evident in the children’s private speech as they engaged in playful manipulation of language forms and creative reproductions of the L2:

- Child 1: Up. Go.
Go up, go down.
Go down, go up.
Go up, go down. (p. 584)
- Child 2: Mine is let’s go. (i.e., “I will leave”)
My it’s go house in. (i.e., “I am going into the house”) (p. 585)

Private speech among preschoolers has been documented not only in ESL contexts (as in the above situation) but also in classrooms where English is taught as a foreign language (FL). The following excerpt comes from a study (Wang & Hyun, 2009) carried out in a school in Taiwan where the students are fluent in Mandarin and learn English as an FL:

- Teacher [Spreads out three picture cards] What are you making, Addie?
Addie [Silence] . . .
Shawn = **I am making sandwiches with . . . cabbages, . . . carrots, and . . . potatoes.**
(spoken very softly)
James = **I am making sandwiches with . . . cabbages, . . . carrots, and . . . potatoes.**
(spoken very softly)
Teacher What are you making, Shawn?
Shawn I am making sandwiches with . . . cabbages, . . . carrots, and . . . potatoes.
James = **I am making sandwiches with . . . cabbages, . . . carrots, and . . . potatoes.** (spoken very softly) (pp. 13–14)

Note: = means discourse is overlapped; **bold** indicates private speech
(The transcription conventions adopted throughout this entry have been slightly modified from the original.)

In this case, both Shawn and James are observed using private speech to create English sentences in fixed patterns in response to a teacher question posed to another student. This practice, known as “vicarious response” (Ohta, 2001), is typical of private speech in the L2 classroom. Through covert responses the learners keep actively engaged in L2 interaction and at the same time rehearse in preparation for future overt production (as it occurred in Shawn’s second turn). It should be noted, too, that private speech does not always occur in the L2. In the same study, a child is recorded softly translating a teacher’s English utterance into his L1:

Teacher: (reading a story to the class) You are not big enough.

Child: 你還不夠大 (in Mandarin-Chinese) (*You are not big enough.*)

(Wang & Hyun, 2009, p. 15)

Note: **bold** indicates private speech

Whereas in L1 acquisition the internalizing function of private speech is characteristic of preschool children, in L2 acquisition this private speech function has also been observed among older children (Broner & Tarone, 2001; de Courcy, 1995) and adults (Ohta, 2001; Centeno-Cortés, 2003; Lantolf & Yáñez, 2003; Yoshida, 2008). A review of these studies reveals five main private speech behaviors that may contribute to internalization of the L2: immediate or delayed repetition and imitation of language models, the already mentioned vicarious response, experimentation with language forms (sometimes just for fun), rehearsal before speaking aloud, and metalinguistic comments (using explicit linguistic jargon) to refer to the L2. Not all these behaviors occur with equal frequency. Yoshida (2008) found that repetition was the most common of 11 different types of private speech used by learners of Japanese in an Australian university. Yoshida’s finding is supported by Guerrero’s (2004) study of the early stages of inner speech development, where subvocal or silent repetition of language being heard or read was also the most frequent behavior reported by the participants. The following excerpt from Yoshida (2008) demonstrates the use of private speech for repetition and transformative imitation (as defined above by Lantolf & Thorne, 2006). In this segment, the teacher starts by providing an example sentence for ‘dake’ (*only*):

Teacher: (writes the sentence on the board) Chokoreito = dake o kaimashita (*I bought only chocolate*)

Learner: = **Chokoreito, chokoreito keeki, tabetai n desu yo, chokoreito keeki o tabetai n desu yo** (*Chocolate, chocolate cake, I would like to eat, I would like to eat chocolate cake*) (Yoshida, 2008, p. 299)

Note: = means discourse is overlapped; **bold** indicates private speech

In her private speech, the learner not only repeats the teacher’s word “chokoreito” (chocolate) but also extends the teacher’s sample to make an utterance of her own creation.

As a self-regulatory mechanism, private speech has also received considerable attention among L2 researchers (see review of studies in Lantolf & Thorne, 2006; and McCafferty, 1994). Within this area of research, externalized private speech is thought to be instrumental in regulating one’s own behavior and gaining control over tasks. By the principle of “continuous access” (Frawley & Lantolf, 1985, p. 22), people who are capable of carrying out mental operations through inner speech can revert to private speech, a developmentally earlier mode of thinking, to gain self-regulation in moments of cognitive difficulty. A possible explanation for reversion to private speech may be that the explicit, unfolded nature

Table 1 Functions of self-regulatory private speech of L2 learners

Metacognitive	Bueno, ¿qué se yo? ¡Voy a adivinar! (<i>Well, what do I know? I'm going to guess!</i>) (Centeno-Cortés & Jiménez, 2004, p. 21)
Cognitive	Now the second picture is different from the first one (McCafferty, 1994, p. 429)
Affective	¡bueno! puff [laughs] yeahh!!!; Ha sido un desastre! (<i>well! . . . puff [laughs] yeahhh!!! It's been a disaster!</i>) (Centeno-Cortés & Jiménez, 2004, p. 21)
Social	(as two learners are writing collaboratively, one learner comments after another's suggestion) Que estu-di, That's not right estudiaremos . . . (<i>that we s-tud, That's not right we will study</i>) (bold indicates whispered private speech; DiCamilla & Antón, 2004, p. 51)

of vocalized private speech—as opposed to the elusive, condensed quality of inner speech—helps stabilize rational thought by keeping attention focused. Studies involving L2 and FL learners do show that they sometimes externalize their thinking processes through the medium of private speech when solving challenging intellectual tasks that demand use of the L2. According to McCafferty (1994), the self-regulatory private speech of L2 learners has four distinct functions: *metacognitive* (to monitor or denote awareness of one's own cognitive processes), *cognitive* (to guide mental operations), *affective* (to release emotional tension), and *social* (to speak for the self and others in collaborative discourse). Table 1 shows examples of private speech for each of these functions.

These four functions are not mutually exclusive; rather, private speech utterances may be multifunctional. In the last example above, the segment “That’s not right” may be seen as having a metacognitive role as well as a social one.

A study conducted by Centeno-Cortés and Jiménez (2004) highlights the role of the L1 in the self-regulatory private speech of L2 learners. In this study, the researchers’ purpose was to determine the nature of private speech that L2 students employ when solving challenging problems stated in the L2. The participants included intermediate and advanced Spanish-L2 English-L1 learners and native speakers of Spanish. Via a Web page, the researchers presented the participants with various problems involving mathematical, logical, visual-spatial, and other types of cognitive tasks. Although more than half of the participants made little or no use of private speech in trying to solve the problems, when private speech was produced, there were three important findings: Firstly, use of Spanish, the L2, increased with proficiency; that is, the advanced learners (and the native speakers) were able to perform most of their reasoning in Spanish. Secondly, the advanced learners tended to switch to English, their L1, when the task became too difficult. Thirdly, private speech in the L2 among the intermediate learners was restricted to using it when reading the problem, repeating parts of it, producing formulaic expressions, and making comments about the task. To actually solve the problem, the learners resorted to their L1. The study confirms the power and persistence of the L1 as a private thinking tool even in cases of advanced L2 proficiency.

In brief, the study of private speech among L2 learners appears to be one of the most fruitful and promising avenues of research in L2 acquisition. Private speech provides teachers and researchers with important clues into aspects of L2 language learning and use that may not be readily perceived but are nonetheless essential.

Probability and Hypothesis Testing

STEVEN J. ROSS

Hypothesis testing is a fundamental tool for the evaluation of any explanatory theory. The classical paradigm for hypothesis testing requires a statement about what consequences will be observable when variables are hypothesized to be related to each other, or are hypothesized to exist in a cause–effect relationship. The conventional inferential criterion for examining the results of experimental manipulations is the probability that what has been observed experimentally could actually be a consequence of randomness. The inferential tool researchers have for decades used is a comparison of the observed outcomes against a competing model that could occur by chance alone. The sections which follow contrast the classical approach to hypothesis testing with an increasingly common alternative, the Bayesian approach. Interested readers should see Hacking (1990) for the history and evolution of probability as an alternative to determinism and positivism.

From Determinism to Probability

Modern social science methods of hypothesis testing using statistical criteria date from the mid-1930s, when Ronald Fisher's analysis of variance first appeared in the psychological literature. Fisher's innovation merged experimental design with probability theory to provide a cogent methodology to test hypotheses made prior to data collection and analysis. Hypothesis formation prior to data analysis made it possible to conduct confirmatory data analysis. After the publication of Fisher's *The Design of Experiments* (1935), which appeared the same year as Popper's *The Logic of Scientific Discovery*, use of hypothesis testing spread rapidly in empirical psychology to the extent that publication in research journals became almost contingent on finding "significant" results (Gigerenzer et al., 1989; Thompson, 1997). By the 1950s, courses in Fisherian statistical analysis became a virtual requirement for graduate students in most social sciences.

Fisher essentially formulated a statistical tool to apply *modus tollens* as a general method of falsification of hypotheses about data collected under experimental conditions (Henkel, 1976). *Modus tollens* specifies that a premise (A) be considered false if an outcome (B) conditional on that premise is found not to be supported by observable evidence.

$$A \rightarrow B$$
$$\neg B$$

$$\neg A$$

Fisher's approach established an empirical method by which an observed outcome (B) could be evaluated as a product of random chance instead of deterministic confirming evidence of the hypothesis (A). The original Fisherian approach to hypothesis testing was grounded on the notion of the null hypothesis. Evidence in support of the null hypothesis, that (B) could be the product of random chance, was eventually recognized as quasifalsification at best, since failure to reject the null hypothesis only provides a test of whether the premise ($A \rightarrow B$) is improbable, though not conclusively and forever false (Howson

& Urbach, 1989). Tests of the null hypothesis require that observed statistical evidence be compared to results that could plausibly occur by chance arising from the generation of outcomes through a random process. The caveat Fisher eventually invoked was that experiments needed to be repeated many times before a stable pattern of support or refutation could be identified. The frequency of finding an outcome that is systematic and not a matter of randomness established the criterion for Fisherian (frequentist) statistical inference.

Even from the early days of frequentist statistical inference, rejection of the null hypothesis as the sole criterion for significance testing was found wanting. Rejection of the hypothesis that observed results were the likely result of randomness was considered by many akin to a “straw man” type of argument (Mohr, 1990). Neyman and Pearson (1933) argued that inductive inference required a decision to accept either the null hypothesis (H_0) or an alternative hypothesis (H_a) and that both needed to be considered in each interpretation of evidence. Their hypothesis testing innovations over time hybridized (Gigerenzer, et al., 1989) with Fisher’s into the frequentist approach to significance testing, and remain to this day the primary tool for statistical inference in many fields.

Neyman and Pearson also introduced the idea that hypothesis testing and statistical inference in general was dependent on statistical power. Statistical power holds that sample size could affect the capacity of a statistical test to correctly reject a false null hypothesis, leading to inferential error (Cohen, 1988). Neyman and Pearson postulated two types of inferential error. A type I error occurs when a true null hypothesis is incorrectly rejected, while a type II error occurs when a false null hypothesis is accepted. Type I error has traditionally been considered the riskier of the two because decision-making may be the consequence of research that is unlikely to be replicable or generalizable to a population. Type II errors, in contrast, are less likely to result in policy actions, and might, with repeated experimentation, lead to results that refute the earlier erroneous inference that the null hypothesis is in fact true in general. Modern approaches to meta-analysis aim to summarize the frequency of research outcomes using this hypothesis testing approach.

Interpreting Significance

All modern statistical tests are comparisons of observed statistics against tabulated or computed probabilities that the observed outcomes of such tests occur through random processes. When an observed statistic passes a threshold which could occur through a random process, conventionally set in many social sciences to one chance in twenty observations ($p < .05$), it is assumed to be systematic and taken as evidence to reject the null hypothesis.

A simple example would be a hypothesis about the relation between two variables such as metalinguistic knowledge and language proficiency. A researcher might hypothesize that these two are linearly related to each other, such that as metalinguistic knowledge increases, proficiency increases proportionally. The researcher collects about 300 cases for whom both variables are available, and measured reliably. A test of the correlation between the two variables yields a product-moment correlation of .020. For a sample size larger than 100, a correlation smaller than .194 could occur randomly. The inference the researcher would make in this case is that metalinguistic knowledge and proficiency are not significantly related at the $p < .05$ criterion. The no-relation or null hypothesis would not be rejected in favor of the alternative.

Thresholds for “significance” are, however, subjective, and depend on researchers’ estimations of risk resulting from faulty inference. When the cost of making the wrong decision about a statistical test is potentially very high, a more conservative criterion (α) for considering the results of the test nonrandom may be set to a more stringent level, such

as one chance in 1,000 ($p < .001$). Statistical decision-making is also subject to variability in the criterion for inferring significance. For instance, the more multiple statistical tests are performed on data, the more likely that some of the tests can appear falsely significant (Toothaker, 1991). There is an increasing error rate (type I error) as the number of comparisons increases such that

$$P(\text{probability of one type I error}) = 1 - (1 - \alpha)^C$$

For example, if a researcher aimed to compare the means of two independent groups on five variables (C), the probability of rejecting a true null hypothesis becomes $1 - .95^5$, or .22 instead of the intended .05. When multiple tests are conducted, researchers are cautioned to control for type I error rates through adoption of stringent criteria for deeming statistical tests as significant. This can be accomplished with omnibus multivariate tests of effects, or by dividing the chosen threshold for significance (α) by the number of comparisons to be performed, and making the more stringent criterion the basis for inference.

Sample Size and Power

The Fisherian and Neyman-Pearson approaches to significance rely on the comparison of an observed statistic with a criterion threshold determined a priori. The classical Fisherian approach provided a criterion to assess a statistical outcome such as a correlation or difference between group means, compared to what would be observed through random chance. The frequentist approach is also more likely to reject the null hypothesis and find support for the postulated alternatives as sample size grows. This point in particular has proven to be problematic for frequentist approaches to statistical inference. As sample size grows, it is possible for test statistics to become “significant,” but only trivially so and not substantively (Cohen, 1994). This tendency has led to calls for reform in many academic journals: for authors to report the magnitude of observed differences in addition to the conventional tests of significance (Thompson, 1996).

Effect sizes provide a metric to describe the magnitude of the observed test statistic. Different types of effect size metrics are possible (Grissom & Kim, 2005), but all conceptually provide the basis for the substantive interpretation of observed outcomes in terms of their magnitude, and not their probability exclusively. Effect size estimations thus augment significance tests as they provide substantive as opposed to probabilistic indices, which can be interpreted by consumers of research. Journals in many applied fields now normally require authors to report effect sizes in addition to the conventional tests of significance. The spread of effect size reporting has been slow, but is becoming the new norm for frequentist research reporting.

The Bayesian Alternative

Although reporting of effect sizes along with conventional significance tests is an improvement over the earlier convention of significance testing alone, in some fields the reform is not seen as sufficient. Howson and Urbach (1989), for instance, assert that the entire frequentist paradigm is without sufficient merit for it to deserve further endorsement. They claim that a more realistic and valid approach is one that eschews significance testing completely. Their endorsement of the Bayesian approach (Iverson, 1984) is predicated on their belief that all hypotheses are inherently subjective. The Bayesian approach postulates that in real-world scientific research an authentic null hypothesis is rarely ever entertained, and that all hypotheses begin with a non-null subjective belief in the likelihood

of particular outcomes (Press & Tanur, 2001). The Bayesian approach thus requires a prior probability that a hypothesis will be confirmed through corroborating evidence. The researcher's prior experience, knowledge of the phenomenon researched, and intuition all inform the a priori formulation of the subjective probability that the hypothesis is likely to be confirmed through evidence. As more data become available, the probability of the a priori hypothesis increases or decreases. The subjective hypotheses can be amended pending the empirical evidence available to support or refute them. In the Bayesian framework, the goal is thus no longer rejecting the null in favor of an alternative, but continual revision of the original subjective belief as confirmatory evidence becomes available.

The Bayesian approach to inference has steadily grown in influence. In some fields such as biostatistics and epidemiology (Spiegelhalter, Abrams, & Myles, 2004) the Bayesian approach to inference is rapidly becoming as common as the frequentist approach, and is projected, its proponents claim, to some day supplant the frequentist paradigm completely.

Familiar inferential statistics such as the *F*-ratio, the *t*-ratio, *z*-distribution, and the chi-square can be generated in the Bayesian approach, with the added advantage that their robustness can be assessed when there are possible violations of the assumptions associated with these inferential statistics (Albert, 2007). The Bayesian approach also provides "credible intervals" which provide the most likely posterior estimates of the statistical parameters of interest. While the credible intervals are conceptually similar to the frequentist confidence interval, they are said to be more precisely estimated in most cases using the Bayesian approach, assuming that the initial prior probabilities are not completely uninformed. When prior probabilities are unknown, the parameter estimates generated through the Bayesian approach closely approximate those estimated with frequentist methods.

A Comparison of Frequentist and Bayesian Analyses

As an example of the comparability of the frequentist and Bayesian approaches to inference, a sample applied linguistics research project is illustrated here. The study concerns the phenomenon of language attrition, or loss of language proficiency, over time. A sample of 847 English language learners were reinterviewed with an OPI after varying lengths of time separating their original and repeated interview. Before each interview, all participants took a 200-item listening and reading test. The dependent variable was a dichotomous code denoting that the second interview outcome was rated lower than the original, suggesting attrition of speaking proficiency over time. The variables used to predict language loss were time between interviews, gender of the learner, and the pretest and the posttest scores on the listening and reading proficiency indicators (Table 1). The outcome was the code for attrition. A logistic regression was conducted first with a frequentist approach testing the null hypothesis for each predictor, all of which were entered simultaneously.

Table 1 Frequentist logistic regression results

<i>Parameter</i>	<i>Estimate</i>	<i>S.E.</i>	<i>t-ratio</i>	<i>p-value</i>

The frequentist logistic regression employs an estimate of the effect of each predictor and its associated standard error. The hypothesis that each predictor's effect on the attrition outcome is larger than random chance is tested against the t -distribution (estimate/standard error), with an exact probability for each t -ratio. The result of the frequentist analysis shows that *time* is the only predictor that accounts for the attrition phenomenon. As more time separates the repeated interview from the original interview, the greater the likelihood that the outcome of the repeated interview will be a lower proficiency rating.

The same logistic regression can be conducted using a Bayesian approach (Table 2). Here, WinBUGS 1.4 (Lunn, Thomas, Best, & Spiegelhalter, 2000) was used to provide a Bayesian analysis of the same model and data set. The main difference between the frequentist and the Bayesian approaches is the need to stipulate a prior probability for each of the predictors in the model. In most cases, a researcher would have some familiarity with the research literature on the phenomenon of interest, and would be guided to some degree about which variables would be more likely than others to influence the dependent variable. Probabilities that the predictors would have a non-zero effect on the outcome would thus have to be specified prior to the analysis and then, through simulation, "burned in" before the final model was tested. In the present case, since there is no specific hypothesis to guide an estimation of the relative or absolute magnitude of the regression coefficients or odds ratios, a "flat" or uninformed prior is used. The flat prior is most similar to the null hypothesis in the frequentist approach, and in the present case can serve to provide a basis for comparison of the two approaches to inference.

After a burn-in of 10,000 iterations in WinBUGS, the regression coefficients and odds ratios were sampled with 10,000 more iterations. The resulting statistics provide the basis for comparison with the model, the conventional logistic regression testing the null hypothesis.

No test of the null hypothesis is available in the output. Instead, a 95% credible interval range is provided for each coefficient. In the present example, the dependent variable is binary, so the odds ratio estimate is a useful guide to interpretation in lieu of the test of the null hypothesis. For all predictors of attrition except for time, the median odds ratio estimates are close to 1.0, which falls within the 2.5% and 97.5% credible interval. Since an odds ratio of 1 implies a coefficient mean of zero, ($\ln(1) = 0$; $e^0 = 1$), the inference is that the coefficients for pretest, posttest, and gender are all inclusive of zero, and therefore have no effect on the attrition phenomenon. In the frequentist interpretation in Table 1,

these variables are all $p > .05$, or not significantly greater than random chance. The odds ratio of time, with a median of 1.205, is within a credibility interval whose lower bound is larger than 1.0. The coefficient for time is thus credible, and matches the frequentist inference that it is not likely to be a matter of random chance: $t = 4.93$, $p < .00001$. The example demonstrates that without prior probabilities that are larger than zero, that is, with uninformed prior hypotheses, the results of the frequentist and Bayesian approaches can be expected to yield similar inferences. This is generally the case for large data sets, suggesting that the Bayesian advantage is likely to be most salient in studies with small samples sizes and low power.

Researchers employing the Bayesian approach would presumably be motivated to do so because they have specific informative hypotheses to test. Recent innovations in Bayesian analysis have made it possible to address the kinds of experimental research most common in applied linguistics without the sole use of the null hypothesis approach. One recent innovation is that of Klugkist, Laudy, and Hoijtink (2005), which involves specification of “informative” hypotheses. As a case in point, a language learning study involving feedback on written error might involve three intervention types and a control group. The four writing accuracy group means would be compared, controlling for prior proficiency differences as a covariate. The difference between the usual null hypothesis approach and the informative hypothesis approach is that the researchers must specify a priori which ordering of mean differences they hypothesize to be observed before the data analysis begins.

$G3 > G2 > G4 > G1$ H_a : The most probable outcome

$G3 = G2 > G4 = G1$ H_b : Possible, but less probable than H_a

$G1 = G2 = G3 = G4$ H_c : The possible null hypothesis, but less probable than H_a or H_b

$G1, G2, G3, G4$ H_2 : An unordered set of outcomes used to initiate the estimation process

No post hoc comparisons would be needed in this approach because the ordering $H_a > H_b > H_c = H_2$ has been predicted. The Bayesian analysis would update the informative hypotheses against the observed experimental data and provide a set of posterior probabilities indicating which of the four hypotheses is most consonant with the experimental outcomes. This approach necessitates ordered hypotheses and requires researchers to make specific prior claims about expected outcomes.

Hypothesis Testing in the Future

Efforts in recent decades to improve frequentist statistical inference through reforms in reporting effects sizes, power, and significance tests have perhaps extended the life span of this form of statistical inference. A quick survey of papers published in academic journals in the applied linguistics domain suggests that the Bayesian approach has not yet arrived. Perhaps the main reason the Bayesian approach to statistical inference is likely to arrive on the applied linguistics scene later than in other fields is the comparative lack of software and training. With the exception of a few item-response theory analysis packages, Bayesian analysis is conducted with open-source code packages such as R or with public domain software such as WinBUGS, which for other than experienced data analysts may present a formidable learning curve. This situation can be expected to change as more texts introducing applied Bayesian analysis (e.g., Hoijtink, Klugkist, & Boelen, 2008; Ntzouflas, 2009) and accessible software become available and are integrated into graduate instruction. If applied linguistics researchers are willing to invest time and effort in learning alternatives to the null hypothesis approach, their time and effort may be well spent.

Processability Theory and Teachability

MANFRED PIENEMANN

A Brief Sketch of PT

The basic idea underlying processability theory (PT) (Pienemann, 1998a; 2005) is the following: at any stage of development the learner can produce and comprehend only those second language (L2) linguistic forms which the current state of the language processor can handle. It is therefore crucial to understand the architecture of the language processor and the way in which it handles a second language. This enables one to predict the course of development of L2 linguistic forms in language production and comprehension across languages.

The core of PT is formed by a universal processability hierarchy that is based on Levelt's (1989) approach to language production. PT is formally modeled using lexical functional grammar (LFG) (Bresnan, 2001). In other words, PT is a universal framework that has the capacity to predict developmental trajectories for any second language. The notion "developmental trajectory" implies a developmental dimension known as "staged development" as well as a variational dimension accounting for individual differences between developmental trajectories as illustrated in Figure 1.

Figure 1 shows two different developmental trajectories, T1 and T2, which are based on the same set of developmental stages (indicated by the dotted horizontal lines). The two developmental trajectories differ with respect to the varieties of learner language that are developed at each stage (indicated by vertical lines).

In this paradigm, each stage represents a set of grammatical rules that share certain processing routines, and each variety of learner language represents a specific variant of the grammatical rules. For instance, in English as a second language (ESL) question formation the developmental sequence shown in Figure 2 has been found (e.g., Pienemann, 1998a, 1998b).

Differences in developmental trajectories are based on the manner in which learners utilize the leeway they have in solving developmental problems. For instance, learners attempting to produce "auxiliary-subject inversion" before they are ready for this structure

Figure 1 Different developmental trajectories

↑ Structure	Example
4. Auxiliary-subject inversion	Where has he been?
3. Copula	Where is he?
2. WH+SVO	Where he is?
1. SVO question	He live here?

Figure 2 Developmental patterns in ESL question formation

(i.e., at level 3 shown in Figure 2) have been found to produce the following learner language variants:

- A Where he been?
- B Where has been?
- C Where he has been?
- D He has been where?

Variants A to D have in common that they get around placing the auxiliary before the subject in WH-questions. In other words, they constitute different solutions to the same learning problem. In Figure 1 each of the different solutions is represented by a vertical line. It is important to bear in mind that for each structural learning process there is a limited set of solutions. In the course of L2 development, the learner accumulates grammatical rules and their variants, allowing learners to develop an individual developmental trajectory while adhering to the overall developmental schedule.

The Processability Hierarchy

The processability hierarchy represents a universal set of processing resources that is modeled using LFG (Bresnan, 2001). A simplified account of the processability hierarchy with a focus on one of the PT mechanisms (i.e., the transfer of grammatical information) is given in Figure 3 where three example constituent structures are listed in the left-hand column. The second column specifies the type of information transfer possible at each stage. ESL morphological structures are given in the next column to exemplify the types

↑	Information exchange		
	Locus of exchange	Example	Illustration
sentence	within sentence	he talk-s	↗ S ↖ NPs VP ↑ ↑ Pro V [3rd pers sg] [pres, cont, 3rd pers sg]
phrase	within phrase only	two kids	↗ NP ↖ Det N [pl] [pl]
category	no exchange	talk-ed	

Figure 3 A simplified account of the processability hierarchy

of structures possible at each stage, and the information transfer involved in the generation of these structures is illustrated in the column on the right-hand side.

The structures that are processable at any given stage are constrained by the available processing resources. As can be seen in Figure 3, at the stage “phrase” grammatical information can be exchanged only within phrases, not beyond the phrasal boundary. Subject–verb agreement (i.e., “third-person-s”) cannot be processed at the stage “phrase” because this structure requires grammatical information to be exchanged beyond the phrasal boundary—as illustrated in Figure 3. In other words, processing resources define and constrain the range of possible production grammars for every level.

At the same time, these constraints leave sufficient leeway for learners to find different solutions to structural learning problems. This was illustrated above with the inversion of auxiliary and subject in English WH-questions. Inversion requires processing procedures at the sentence level in the hierarchy. L2 learners can nevertheless produce WH-questions before the procedures for inversion are in place. When they attempt to do this, learners have four structural options that avoid auxiliary–subject inversion. The options available are all processable using the resources available at the previous stage, and the number of options is limited because of the limited resources that are available.

PT Mechanisms

PT is based on two psycholinguistic mechanisms which will be summarized below: (a) transfer of grammatical information and (b) lexical mapping.

The initial version of PT (Pienemann, 1998a) focused on constituent structure and the *transfer of grammatical information* within it, using feature unification. The modeling of feature unification, as envisaged in this approach, is illustrated in Figure 3. In the sentence “Peter sees a dog” subject–verb agreement relies on information contained in the subject–noun phrase, namely the feature values PERS=3 and NUM=SG. These feature values are unified (or “compared and found to match”) after the verb has been produced. In other words, grammatical information on PERS and NUM that is created in the subject needs to be placed in a temporary store during sentence generation in order to produce subject–verb agreement. Figure 4 shows that subject–verb agreement utilizes the top of the constituent structure (“S”) to match the information attached to the subject and the verb.

In the design of PT, the point of unification is related to a hierarchy of processability that reflects the time course of real time processing as detailed in Levelt (1989). In this way a range of morphological and syntactic processes can be aligned with a universal hierarchy of processability yielding developmental trajectories for the given target languages. The hierarchy that results from a comparison of the points of feature unification can be

Figure 4 Feature unification in the S-procedure

4 PROCESSABILITY THEORY AND TEACHABILITY

illustrated on the basis of Figure 3 which shows that the example structures illustrated in Figure 3 can be ordered as follows:

1. No exchange of grammatical information (= no feature unification),
2. Exchange within the phrase,
3. Exchange within the sentence.

Once one applies this hierarchy to morphology in English second language acquisition (SLA), the following developmental trajectory can be predicted:

1. past -ed
2. plural -s
3. third person -s.

In order to appreciate the universal nature of PT it is crucial to consider that the hierarchy illustrated in Figure 3 is not language-specific and that, in principle, it applies to the transfer of grammatical information in any language. In contrast, the examples that were given for ESL morphology utilize this hierarchy and apply it to one specific target language. The application of the full processability hierarchy to the syntax and morphology of specific languages will, of course, involve more detail of the LFG formalism.

The second mechanism which was added to PT by Pienemann, Di Biase, and Kawaguchi (2005) is *lexical mapping*. This mechanism is based on a component of LFG that deals with the way in which the semantic roles (e.g., “agent,” “patient”) of the intended message are expressed in grammar. All languages have a wide range of alternatives in expressing the intended semantic roles. For instance, the agent of an action can be expressed as a grammatical subject (in active sentences—“Peter eats a banana”) or as an adjunct (e.g., in passive sentences “The banana was eaten by Peter”). In other words, *lexical mapping* accounts for the mapping of semantic roles onto grammatical functions.

In PT the default mapping principle is *unmarked alignment* which is based on the one-to-one mapping of semantic roles onto grammatical functions. Naturally, mature languages allow for a much wider range of relationships between semantic roles and grammatical functions, and these develop stepwise in SLA. Principles of lexical mapping can account for these developmental processes.

In other words, *unmarked alignment* is the initial state of L2 development. It is based on the one-to-one mapping of semantic roles onto grammatical functions. At the initial state learners lack the grammatical means to express information that is structured in a nonlinear way. Therefore they have no choice other than to produce sentences using canonical word order (SVO for ESL) and they are therefore initially unable to express passives or other structures which are based on a nonlinear relationship between semantic roles and grammatical functions. These constraints are relaxed as the acquisition process proceeds.

Key Hypotheses

PT entails the following key claims:

- I The processability hierarchy applies to typologically different languages. This point was demonstrated in a number of studies on L2 development including Japanese, Chinese, and Arabic (cf., Di Biase & Kawaguchi, 2002; Pienemann, 2005; Zhang, 2005; Kawaguchi, 2005; Mansouri, 2005).

- II First language (L1) transfer is constrained by processability. This implies that L1 forms can be transferred to the L2 only when they can be processed in the developing L2 system. In other words, this implies an operationalized “partial transfer” position (Pienemann, Di Biase, Kawaguchi, & Håkansson, 2007).
- III Both first and second language acquisition is constrained by the PT. Nevertheless, both types of acquisition may be associated with fundamentally different developmental trajectories (Pienemann, 1998a, 1998b).
- IV Bilingual language development can be compared across different languages on a universal scale based on PT (Pienemann, Kessler, & Itani-Adams, 2011).
- V The impact of formal teaching intervention on the course of SLA is constrained by processability (Pienemann, 1984, 1989).

Pienemann and Kessler (2011) give a basic introduction to the above and most other aspects of PT.

The Teachability Hypothesis

The last claim in the above list has become known as the teachability hypothesis (TH) (Pienemann, 1984, 1989) which was created long before PT. The TH was originally based on the observation that learners follow universal stages of development in natural *and* in classroom contexts (Pienemann, 1998a, 252–64). In a number of experiments Pienemann (1984, 1989) tested if the natural order of acquisition “can be beaten” by formal instruction. This test was operationalized by selecting L2 learners on the basis of their current level of L2 acquisition. Two groups were formed (a) with learners at level x and (b) with learners at level $x + 1$. Both groups were exposed to the same classroom input which focused on level $x + 2$. It was found that learners at level $x + 1$ progressed to level $x + 2$ and that learners at level x did not progress at all. These findings were supported in several replication studies (e.g., Ellis, 1989).

These results were interpreted in terms of psycholinguistic constraints on formal instruction. The psycholinguistic framework that was used was that of processing strategies which were shown to form an implicational hierarchy, with each step being the prerequisite for the next. Skipping a step in such an implicational hierarchy is impossible because the higher-level processing strategy ($x + 2$) requires the strategy of the previous level ($x + 1$) to have developed before the $x + 2$ -strategy can be functional. The strategies framework can now be translated into PT (Pienemann, 1998a) because the processability hierarchy is also implicational. Embedding the TH in PT has a number of advantages. PT applies to a wider range of L2 phenomena. It is typologically plausible, and it links up with a theory of grammar thus opening up the study of epistemological issues.

At a practical level, the TH represents a set of constraints on teachability which describe necessary conditions for formal instruction to promote acquisition. However, it does not describe sufficient conditions for formal instruction to be successful. Therefore the success of “timed instruction” depends on factors inherent in the process of formal intervention—bearing in mind that formal intervention cannot “beat” acquisition. The practical implementation of the TH in classrooms is supported by a computer-based linguistic screening procedure (rapid profile) (Pienemann, Johnston, & Brindley, 1988; Mackey, Pienemann, & Thornton, 1991; Pienemann & Kessler, 2008; Kessler & Keatinge, 2008) that yields rapid snapshots of each learner’s interlanguage system.

Professionalization of Interpreters

OLGIERDA FURMANEK

In the last decades of the twentieth century and the first years of the twenty-first century, the different fields of interpreting have experienced various degrees of evolution in their professional status depending on the type of interpreting and on the country, and in many cases even on the region of a particular country. In 1996 Viaggio, reflecting on the development of conference interpreting, stated that “in 50 years, we have gone a long way towards accomplishing what took medicine, for instance, some 25 centuries to achieve: turning into a recognized profession based on a recognized discipline taught at recognized academic institutions.” In the same year Mikkelsen (1996) acknowledged the need for discipline and professional structure in the field of community interpreting, which until then was still considered a volunteer activity in many countries. She presented a comparative analysis of community interpreting and other professions, and recommended a course of action to promote the profession over the medium and long terms. Nine years later Corsellis (2005) continued to call for consistent, accountable, and transparent structures that would allow linguists working in public services to become regulated professionals, adding that “the debate on the detail of the long-term professional structures is still under way” (p. 154). In 2011 the situation continues to evolve in all fields of interpreting but, based on major trends, it can be noted that interpreting activity has gradually been becoming a profession and continues to strengthen its position as a full-fledged career.

Based on the professionalization continuum comparison shown in Table 1 (Curnow & McGonigel, 2006), which compiles attribute, process, and power and market models, the activity of interpreters is moving into the final stages of professional development. These final stages toward the professionalization of interpreters, which in several areas of the world are yet to be attained, are defined as

- academization—education, a body of research, and academic journals;
- identity—service in relation to social values, and professional associations and trade unions; and
- standardization—terminology, a system of norms, accreditation, and legislation.

Academization

Education

The modern historical record of the interpreting profession begins after World War II, when a sudden demand for training interpreters arose. Interpreters were generally needed by heads of state, and conference interpreting grew as the most popular area. At that time interpreters evolved from those people who had learned two languages from birth and practiced simultaneous interpreting to those who had studied multiple source languages in order to be interpreters (not “naturally,” like the previous generation) but had not attended interpreting schools. In 1952 the first students trained in simultaneous interpreting graduated from the School for Interpreters and Translators in Geneva, Switzerland.

2 PROFESSIONALIZATION OF INTERPRETERS

Table 1 Comparison of the characteristics of three models of professionalization by stages of professionalization (Curnow & McGonigle, 2006)

<i>Type of model</i>	<i>Professionalization continuum</i>		
	<i>Initial stages</i>	<i>Middle stages</i>	<i>Final stages</i>
Attribute models (based on Flexner, 1915; Pavalko, 1988)	Use of skills based on theoretical knowledge	Education and training related to skills and knowledge	Performance of service that is for the public good
	Unique knowledge base justifying the claim to special expertise	Long training period requiring specialized knowledge and indoctrination into the occupations subculture	Code of conduct to ensure professional integrity Service versus profit motivation Relevance of work to social values Competence of professionals ensured by examinations Code of ethics and system of norms that are parts of the subculture, reinforcing motivation, autonomy, and commitment Self-regulating and self-controlling; only members of the profession judge and certify who is competent to practice
Process models	Full-time occupation identified	Training or educational programs provided Professional association established	Code of ethics established Support of law provided
Power and market models	Development of specific knowledge	Systemized/ standardized training of practitioners	Standardized body of accredited knowledge
	Special knowledge and skills	Restricted supply of services	Monopoly of services

Conference interpreters were professionalized with the founding of the International Association of Conference Interpreters (AIIC) in Paris in 1953. With the historical scene changing in the cold war, the decolonization of Africa, the formation of the European Union, the collapse of communism, the opening of Asian countries to globalization, and migration movements increasing in all parts of the world, the need for interpreting services grew significantly in the second half of the twentieth century. In its last decade, interpreting programs grew proportionally to the numbers of countries admitted to the European Union. In the USA and Canada the need for training responded to the waves of migration

resulting from the political changes in Asia, Africa, South America, and Eastern Europe.

Today educational programs at first- and second-cycle levels in higher education, workshops, and seminars for training both conference and non-conference interpreters are offered on a regular or irregular basis in almost every country. In 2010 over 300 schools offering degrees, with a wide range of quality, in translation and interpreting (both programs are still combined at many educational institutions) were identified worldwide. An online survey of interpreting schools is being carried out and the results will be posted on the AIIC Web site (<http://www.aiic.net>) upon completion. In 2010, two PhD programs in interpreting studies were in existence (whereas in 1990 there were none), at the University of Geneva, Switzerland, and at the University of Manchester, England, not to mention several doctoral degrees that are offered worldwide in conjunction with or as part of translation studies programs.

As interpreting studies programs at both the first-, second-, and even third-cycle levels are on the rise in academia, the first years of the twenty-first century have also brought a stream of pedagogy-related materials (e.g., Sawyer, 2004; Tennent, 2005). Additionally, voices advocating professionalization and professional training of not only interpreters but also teachers of interpreters have been raised in various parts of the Western world (Austria, the United Kingdom, Spain, Italy, the United States), as well as in regions with less of a tradition of interpreting services and teaching of interpreting due to their former sociopolitical situation, such as Central European countries, Malaysia, and China. An undergraduate program training interpreters' educators was offered at Stockholm University in 2001. A Master of Arts in Teaching Conference Interpreting was offered for several years at the University of Geneva, but has been discontinued. While Furmanek (2010) defined a need for solid education in interpreting didactics and proposed a comprehensive curriculum for educators of interpreting at the graduate level, graduate-level programs in the methodology of teaching interpreting came into existence at Wake Forest University, USA, in 2009, and Macquarie University, Australia, in 2010.

Research and Academic Journals

Interpreting studies began at the crossroads of various disciplines drawing scholars from a variety of fields—from applied linguistics, pragmatics, sociolinguistics, and translation theory, through cultural studies, social studies, and communication, to anthropology and philosophy, and it still continues to be an interdisciplinary domain (Cynthia Roy, Cecilia Wadensjö, Helen Tebble). However, in the last thirty years of the twentieth century a group of scholars focusing solely on interpreting arose. Next to such prominent pioneers as Danica Seleskovitch and Marianne Lederer have appeared Daniel Gile and Barbara Moser-Mercer, whose studies focus primarily on conference interpreting. Claudia Angelelli, Ann Corsellis, Franz Pöchhacker, María Isabel Abril Martí, Uldis Ozolins, Sandra Hale, Elaine Hsieh, Robin Setton, and Miriam Shlesinger are among the most active interpreting scholars since 2000. Interpreting researchers continue to publish in traditional linguistics- and translation-related venues (*Meta*, *Babel*, *Multilingua*, *Journal of Specialized Translation*, *Intercultural Pragmatics*, *Discourse Studies*, *MultiLingual*) as they have done since the 1950s. More frequently, however, the name of the field, "interpreting," is acknowledged in the title of new journals that combine both written and oral translation scholarship: *Interpreting*, *Translation and Interpreting Studies*, *Interpreter and Translator Trainer*.

As of 2005 a continuous increase in the number of interpreting publications appearing in nonlinguistic journals has been observed, thus documenting a recognition of interpreting-related issues by other disciplines, particularly in the fields of public health. Examples are *American Journal of Public Health*, *Communication and Medicine*, *Health Affairs*, *Healthcare Risk Management*, *International Journal for Quality in Health Care*, *Journal of Clinical Ethics*, *Journal*

Identity

Service in Relation to Social Values

Interpreting as a profession has now become more self-reflective, and a greater number of research publications and community-based surveys across the world examine the value base of linguists as professionals and of language services as a career field. Interpreters are more aware of their own value base and their relationship to the profession, as well as their power.

Surveys, questionnaires, and surveys of surveys proliferate across the world. Regional examples range from China and Malaysia to the Netherlands, Poland, and Spain, but many are Web-based and thus are conducted worldwide (e.g., Ibrahim, 2007; Tryuk, 2007; Salaets & van Gucht, 2008; Katan, 2009; Martin & Ortega Herraáez, 2009; Setton & Liangliang, 2009; Zwischenberger, 2009). In addition to these scholarly efforts, many non-conference interpreting associations have recently been conducting surveys on self-perception among interpreters, hoping to define and also promote the image of an interpreter who is conscious of his or her responsibilities and rights, and of his or her place in the interpreting situation as a professional contributor rather than a helper.

Like those in other emerging fields in search of their own professional identity, such as social work, emergency medicine, or humanitarian health work, interpreters have begun to ask questions about the extralinguistic and extracultural factors that play an important role in their job: compassion, decision making, trustworthiness, integrity, and conscientiousness. These questions draw on developments in related disciplines such as psychotherapy, social policy, and cultural mediation, as well as from sociopolitical issues including court trials of unreliable interpreters, the life-and-death responsibilities of military interpreters, interpreters' ethical dilemmas as related to deportation and torture, the liability of health-care interpreters regarding medical errors, and so on. As Sela-Sheffy and Shlesinger put it in their introduction to the two-part special issue of *Translation and Interpreting Studies*, the identity and status of language professionals are "about the experience of the people who create and shape the translating professions, and the way they understand their occupational world and make sense of their job, so as to locate themselves as professionals and maintain a special identity and dignity" (2009, p. 124).

Professional Associations and Trade Unions

As in the titles of academic journals, the term "interpreting" is second to "translation" in the names of many professional associations. Both fields are intended to promote linguistic careers, but there are increasingly more groups of language professionals made up solely of interpreters. Regional or national associations include the Japan Association of Interpreting Studies, founded in 1999; the National Register of Public Service Interpreters (United Kingdom), founded in 2006; and on a more global level the International Association of Medical Interpreters (United States) or the European Union Legal Interpreting and Translation Association (ELITA), in whose title "interpreting" is placed first. Other recently founded associations specifically distinguish between translators and interpreters and, in spite of the length of the title, the term "interpreting" or "interpreter" is present in the name of the association, for example the International Association of Professional Translators and Interpreters (founded in Argentina, 2010) or the American Translation and Interpreting

Studies Association (founded in the USA, 2002). Following the general trend of the late decades of the twentieth century, professional organizations of interpreters tend to replace trade unions as the former find themselves becoming strongly unionate and lobbying-oriented, in addition to practicing traditional professional job-entry control and promoting the profession's ethics. As the discipline of interpreting becomes academicized, the number of academic associations that include interpreting studies as a discipline on its own is also on the rise.

Interpreting conferences are organized on a yearly basis on different continents. Even though it is not associated with any particular organization, the tri-annual Critical Link conference, organized by Critical Link International: International Council for the Development of Community Interpreting (founded in 1992 in Canada), prevails as the most prestigious congress in the interpreting field.

Standardization

Terminology

The general public (including interpreting services users and researchers in other academic areas) continue to need education on how the profession of interpreter differs from that of translator. The term "interpretation" is widely used incorrectly as a synonym for or instead of "interpreting." In his revised edition (2009) of *Basic Concepts and Models for Interpreter and Translator Training*, Gile corrected the first edition of the book by using the term "interpreting" instead of "interpretation," an important milestone in the standardization and clarification of interpreting terminology. Denominations of interpreting in relation to its settings, types, and modes vary depending on the country, and have not yet been made uniform or stabilized. For example, the term "public service interpreting" (PSI), which is the most widely accepted and is often interchanged with the second most used, "community interpreting," is only one of the seven terms that refer to public service interpreting—bilateral, community, dialogue, discourse, liaison, public service, triad—depending on the region of the world or on personal preference.

System of Norms

AIIC has published its own code of ethics and professional standards that apply to conference interpreting; however, there is no clear definition or distinction between codes of ethics, codes of conduct, standards of practice, and career guidelines regarding non-conference interpreting services. As a result, requirements or recommendations under various names in other fields of interpreting developed throughout the second half of the twentieth century at different speeds. In general, they address confidentiality, ethical issues, impartiality, transparency, the role of the interpreter, cultural competency, intervention boundaries, and sometimes specific procedures in relation to the particular interpreting context such as medical, legal, educational, or military.

Canada, Australia, and Sweden are recognized as pioneers in advancing non-conference interpreting services and introducing standards and state regulations for working language professions in the field and those served by them in the 1960s and 1970s. The United Kingdom, Spain, and South Africa began to develop and introduce standards in the 1980s. Many interpreters in the field of non-conference interpreting still follow AIIC standards due to profession fragmentation and the absence of a regulative body in most countries in Asia, Africa, and Central and South America. In 2005 Bancroft reported that standards of practice for interpreters in various fields were beginning to appear around the world, and that evidence of professionalization is now noted particularly in standards dedicated

to a specific field of interpreting. She identified medical interpreting, next to educational and legal interpreting, as the field in which standards of practice show “more depth of reflection, concern for the client and respect for the complex roles of the interpreter” (Bancroft, 2005, p. 29).

Accreditation and Legislation

Due to the variety of interpreting settings and its particular specifications, accreditation is one of the most challenging and complex issues in the interpreting field. Discussions are ongoing in regard to certifying bodies, requirements, levels of certification, and legislative regulations for those who perform interpreting as an income-producing activity and for those who hire interpreters’ services.

In the vast majority of countries there is no requirement to register and anyone can practice as an interpreter. In some countries state agencies offer exams that allow one to receive a license as a certified or sworn court interpreter (e.g., Poland, Sweden, the USA), but in other fields certification efforts are still underway and vary greatly depending on the country. For example, certification exams may be offered by independent associations (e.g., as in Canada and the United Kingdom) and are recognized by government administrations and state institutions. The National Accreditation Authority for Translators and Interpreters Ltd (trading as NAATI) in Australia stands out as an agency that regulates national standards and serves as an accreditation body for translators and interpreters. In January 2005 an official document released by the Chinese General Office of the National Ministry of Personnel stated that starting in that year the China Aptitude Test for Translators and Interpreters (CATTI) would be the only test that determines the qualification and ability of translators and interpreters in China.

Since 2000, academic and professional associations have joined forces to advance efforts on standardization and regulative programs in both Europe and the Americas. For example, ELITA’s goal in 2008 was to collate and disseminate best practices in training and teaching materials, national certification and registration systems, and best professional practices pertaining to legal interpreting. In the same year, the US Certification Commission for Healthcare Interpreters brought together the necessary stakeholders through a nonprofit organization whose main mission is to develop and administer a national and valid certification program for health-care interpreters.

One of the obstacles to standardization is that no one generally accepted profile for the job of interpreter exists. There are many research sources that list characteristics related to the job and to the people who hold it (research reports, hiring protocols from health agencies, government documents, and occupational Web sites), but these resources are not well integrated. Work is in progress to establish globally accepted ISO 9001 standards (to be finalized and published in 2012) for non-conference interpreting that, along with the validated job profiles that are beginning to be commissioned or researched (United States, Spain), are intended to become the foundation and reference for accreditation and hiring regulations worldwide.

Along with the positive side of professionalization, its negative effect should be taken into consideration. In spite of educational programs and official regulations, in some countries clients still tend to use untrained interpreters, especially in medical, educational, or sports interpreting. The accelerated and unbalanced professionalization of interpreters may affect teachers’ qualifications in interpreter training programs.

The multiplication of associations, competing or redundant standards, lack of coordinated efforts to increase public awareness about the work of the interpreter, and short-term research funding aiming at providing temporary solutions in countries with high migration indexes add to the continual delay in the professionalization of the interpreting profession.

On the other hand, new, solid research is emerging, interpreters' self-awareness as professionals is higher than ever, and professional organizations are attempting to improve their communication in order to join their efforts to ensure legislative support worldwide. Interpreters' desire for professional autonomy and proper remuneration, as a result of the predicted growth for the language industry in the years to 2040, may be the best stimulus for the conclusive period in the professionalization process of interpreters. It is very likely that 2020s and 2030s may bring to fruition the missing elements from the final stage of the professionalization continuum, particularly in non-conference settings, and the discipline of interpreting will thus be fully transformed into a profession.

Program Evaluation

JOHN M. NORRIS AND YUKIKO WATANABE

Introduction to Program Evaluation

According to Patton (2008), “*Program evaluation* is the systematic collection of information about the activities, characteristics, and results of programs to make judgments about the program, improve or further develop program effectiveness, inform decisions about future programming, and/or increase understanding” (p. 39, emphasis in original). Evaluation is systematic in that it involves the collection of data to answer questions about social, educational, and other kinds of programs. In focus are any of the elements that constitute programs, including: (a) the needs of individuals to which programs respond, (b) the theories that underlie program design, (c) the human and other resources that are invested in program development and delivery, (d) the activities and materials via which programs are implemented, (e) the effectiveness of programs at helping participants learn or achieve other goals, and (f) the benefits or drawbacks that accrue for individuals and society as a result of programs. The combination of these diverse elements into a deliberate set of practices provides the logic by which a program seeks to contribute value, typically to overcome perceived social problems, to enhance the quality of life for particular segments of society, or to facilitate the daily human business of getting by.

Evaluation focuses an empirical lens on the elements of programs and the roles that programs play in society. In this sense, evaluation is akin to research, as it involves asking questions, designing investigations to answer those questions, and collecting pertinent data. However, evaluation differs from research in several important ways. While research is generally theory-driven (i.e., either generating or testing theories), evaluation is typically decision- or action-driven. The questions that motivate evaluation are asked and answered with particular, practical purposes in mind, such as improving program quality, providing funding to support innovation, developing the capacities of participants, holding programs accountable to ethical or achievement standards, and disseminating understandings about “best practices.” Evaluation also generally treats holistic programs as the unit of analysis, complicating the investigation of numerous variables that interact as programs are realized, from practitioners and participants, to physical settings, to resource constraints, and beyond. Clearly, in order to answer the variety of questions that might be asked about programs, in all their complexity, and to meet particular decision-making purposes, the methodologies for evaluation also range across the entire “qualitative” to “quantitative” spectrum. For this reason, Cronbach et al. (1980) argued “The evaluator will be wise not to declare allegiance to either a quantitative-scientific-summative methodology or a qualitative-naturalistic-descriptive methodology” (p. 7). Epistemologically, then, evaluation is best described as a pragmatic undertaking, with “utility” as the primary criterion, and thus accepting of the widest possible variety of data-collection methods in accordance with the diversity of questions and foci for inquiry (Patton, 2008). Ultimately, the intent of evaluation is to produce evidence that can be used by actual decision makers and other stakeholders to understand programs and take needed actions.

2 PROGRAM EVALUATION

As a discipline within the social sciences, program evaluation has a relatively recent history (Rossi, Lipsey, & Freeman, 2003). Emerging in conjunction with large-scale federal investment in social programs during the post-World War era, largely in the United States, evaluation initially adopted a primarily summative (product-oriented) and accountability-driven focus on the measurement of outcomes and the comparison of programs through experimental methodologies. During the 1960s and 1970s, evaluation practice evolved in response to demands for formative (process-oriented) insights that could be applied to the improvement of programs, especially in education, by adopting new designs and data-collection methods, from survey research to observations and interviews. The 1980s saw the formalization of evaluation as a professional/scholarly discipline, including the founding of the American Evaluation Association in 1986, and by the early 1990s standards of professional practice, including a broad commitment to methodological heterogeneity, had been adopted. The 1990s and 2000s witnessed rapid expansion of program evaluation worldwide, including the creation of the *International Organization for Cooperation in Evaluation* in 2003, as well as the diversification of evaluation interests in contexts ranging from business and health to social and governmental services to international development, and, of course, to all aspects of education.

The Emergence of Language Program Evaluation

Within applied linguistics, program evaluation is associated primarily with the field of language education and, to some extent, language policy and planning. Historically, language program evaluation paralleled the emergence and development of mainstream evaluation during the early decades, though the corresponding published record is scant. Two approaches were predominant during this first phase of language program evaluation (Beretta, 1992). On the one hand, evaluators sought to demonstrate the superiority of one language teaching method over another through the use of quasi-experimental comparisons between classes, schools, or both, utilizing batteries of language tests as the primary indicator of program effectiveness. On the other hand, short-term managerial evaluations were carried out for the purpose of monitoring programs and ensuring their accountability to funders. By and large, these evaluations occurred at the behest of large-scale English language teaching organizations (e.g., the Overseas Development Administration in the UK), and they featured brief visits to schools by a language expert (generally an applied linguist), who would reflect on aspects of program implementation and then render some kind of a judgment about the program's future.

Critical reactions to these prevailing approaches spawned numerous publications on evaluation during the 1980s and 1990s, initiating the first scholarly treatments of language program evaluation in applied linguistics (e.g., Mackay, 1988; Brown, 1989; Alderson & Beretta, 1992). First, evaluators realized that large-scale experimentation with language programs or methods was virtually impossible due to the lack of control over population sampling, teacher preparation, actual program delivery, and numerous other variables that inhere within real educational settings. Second, they argued that the "Jet-In Jet-Out Expert" (Alderson & Scott, 1992, p. 25) approach was largely arbitrary and hence unfair to program insiders, and that it led to very little in the way of empirical evidence that could be used for local purposes. Third, it became apparent that a thorough understanding of context and implementation was essential for an understanding of how and why language education practices were functioning or not, which implied new methodologies for investigating and accounting for complex interactions between people, environments, and program elements. Fourth, innovative efforts at involving teachers and other program insiders in evaluation led to the realization that participation by stakeholders is vital, given that such

involvement led to greater local investment in the process and more actions being taken to improve programs. Finally, perhaps the key contribution of this first generation of scholars was the broad agreement that language education needed to be evaluated for a variety of purposes, ranging from local development and improvement to external accountability and funding, and that any single evaluation method was not likely to meet all possible purposes. Accordingly, the starting point for any evaluation had to be the identification of precisely which purposes were being pursued, followed by the determination of appropriate methods.

Culminating this energetic initial stage in the scholarship of language program evaluation was the publication of a handful of highly informative textbooks and edited collections (see Suggested Readings), contributing a newfound awareness about the scope of language programs (from needs to outcomes) and useful guidance on the array of data-collection methods (from focus groups to proficiency tests). However, following the mid-1990s, publications on language program evaluation diminished markedly, and it was not until the mid-2000s that renewed interest in and demand for evaluation led to meaningful iterations in language program evaluation practice.

Contemporary Issues and Approaches in Language Program Evaluation

Several key issues have provided a major impetus for renewed interest in language program evaluation since the early 2000s. The accountability movement, coupled with a variety of mandates to evaluate educational outcomes, has, for better or worse, forced language educators to consider the role evaluation is playing in shaping their programs and practices. In higher education (e.g., in the form of university accreditation in the United States, quality assurance mechanisms in Japan, or assessment exercises in the UK), language programs are required to articulate the valued achievements of their students to the design of courses and curricula, to document that relationship using evaluation—in particular outcomes assessment—and to act upon the resulting evidence in cycles of program improvement (e.g., Norris, Davis, Sinicrope, & Watanabe, 2009). In primary and secondary education, accountability-driven evaluation takes the form of large-scale standardized assessments of the progress being made by learners towards the achievement of learning standards in core competencies; in the United States, for example, considerable evaluative attention has been paid to the English language development of immigrant and language-minority learners (e.g., Gottlieb & Nguyen, 2007). Similarly, governmental language education policies worldwide have come increasingly with the stipulation that policy implementation and outcomes be subjected to public scrutiny through evaluation, such as the assessment of Irish language development among school-age learners in Ireland (e.g., Harris, 2009). Lastly, the funding of research and innovation in language education is also increasingly accompanied by the requirement of rigorous external evaluation, such as the evaluation of experimental heritage language programs in Australia (e.g., Elder, 2009).

In spite of, or perhaps because of, this vigorous attention to externally mandated evaluations, a second trend has arisen in the form of internally driven evaluation of language programs. In a survey of college language educators in the United States (Watanabe, Norris, & González-Lloret, 2009), one of the main reasons reported for engaging in evaluation was a personal/professional responsibility to ensure the value of language education. Key here is the notion that language teachers are at the heart of all aspects of language education, and it is only through the direct involvement of language teachers in evaluation, and the valuing of their perspectives, that meaningful, lasting change can take place (e.g., Kiely, 2009). Also at stake is the emerging realization that evaluation offers a medium through

4 PROGRAM EVALUATION

which language educators can express and demonstrate the unique contributions of their language programs to institutions and society, not least as a means of disciplinary survival in a time of burgeoning economic crises coupled with an existential crisis of the humanities in general (e.g., Norris, 2006).

In the contemporary era of heightened awareness and investment in language program evaluation, approaches have evolved considerably, building upon the initial foundations outlined above. Key characteristics include the following:

- Roles and responsibilities in evaluation have shifted, with greater emphasis on facilitation of evaluation processes by evaluation consultants (rather than the rendering of “objective” judgments) and direct participation in all aspects of evaluation by program insiders and other intended users; for example, Norris et al. (2009) document examples of university language teachers and administrators developing, implementing, and acting upon their own evaluations in response to external mandates.
- Much greater attention is being paid to the identification of intended users and uses for evaluation, and the prioritization of important questions, as the primary stage in operationalizing evaluations that will lead to meaningful decisions and actions; for example, Yang (2009) demonstrates how teachers and administrators in an English language program first collaborated in establishing the purposes for an evaluation and in determining appropriate data-collection methods, and then used findings to make needed changes in teacher induction practices.
- The focus of evaluation has been refined to specific elements of language programs at particular stages in their development and implementation; for example, Norris (2008) reports on multiple cycles of evaluating the assessment practices in a German language program, where distinct questions and methods were implied as assessments were first developed, then trialed, then used, and ultimately sustained.
- Data-collection designs and tools are becoming more precise, and multiple methodologies are regularly employed to answer evaluation questions; for example, Llosa and Slayton (2009) report on the contribution of both standardized achievement testing, within an experimental design, and classroom observations and interviews in order to capture the implementation realities of a supplementary reading program and its apparent lack of impact on English language learner development.
- Longitudinal evaluations are in greater evidence, with evaluation practices being built into language program delivery from the outset; for example, McDonough and Chaikitmongkol (2007) trace the collection and use of evaluative data over a year of innovation efforts in a task-based language program in Thailand.

While characteristics like these reflect renewed scholarly interest in the potential value of program evaluation to both illuminate and improve language education, it is also the case that countervailing trends persist, such as the heavy-handed emphasis on “objective” accountability testing for educational reform (e.g., the *No Child Left Behind Act of 2001*) and “rigorous” scientific methods for educational evaluation perpetuated by the US Department of Education in the form of its *What Works Clearinghouse*. It remains to be seen, then, to what extent language education culture will transform to incorporate evaluation as a regular part of its practice, in an effort to meet persistent requirements for accountability but also in pursuit of ongoing program development and perhaps even empowerment (Kiely & Rea-Dickins, 2005). Certainly, that eventuality will depend in part on the success of evaluation capacity-building efforts within language programs and applied linguistics (Davis, Sinicrope, & Watanabe, 2009), often in direct conflict with perceived and actual threats of external evaluation for pejorative or bureaucratic purposes. The future of language program evaluation will also depend on research into the realities of organizational

and other kinds of learning that can result from evaluation. If the key contribution of evaluation is provision of an empirical basis for learning about language education programs and policies, for the purpose of informing current and future decisions, then that premise must itself be examined. Similarly, the interface between theories of second language acquisition, language teaching methods, and educational programming remains ambiguous at best, yet it is precisely at this interface—as theory- and research-based ideas are put into practice with actual teachers and learners—that program evaluation stands to contribute not only to local decision making but also to more generalized understandings about effective language instruction. Accordingly, Kiely and Rea-Dickins (2009) “envisage that future evaluation for the development of instructional strategies will involve accounts of implementation . . . accounts of how decisions are taken, rather than ‘branded’ methods tested and quality-assured for replication in new contexts” (p. 668). A future where program evaluation is embraced as a core endeavor within applied linguistics may well be within reach of the next generation of language program evaluators, but only to the extent that publication and presentation venues are expanded, applied linguists are trained in evaluative methodologies, and scholarly traditions of meta-evaluation are fostered.

Prompted Production

PATRICK REBUSCHAT AND ALISON MACKEY

Prompted production refers to language use that occurs in tasks which encourage, or “prompt,” participants to produce particular linguistic structures. Prompted production tasks are widely used in language research (including child language development, second language research, psycholinguistics, and sociolinguistics) and represent a convenient way of collecting linguistic data. In contrast to naturalistic data collection procedures (e.g., classroom observations, diary studies), prompted production tasks are generally designed to elicit particular language structures (for example, English plural -s), which greatly facilitates the data collection process. In this entry, we describe four of the most common prompted production procedures, from the more structured to the less structured: elicited imitation, interactive tasks, narratives, and role plays.

Elicited Imitation

Elicited imitation tasks require participants to listen to linguistic stimuli and to repeat them after a delayed prompt. In a typical elicited imitation task, sentences are presented to participants auditorily, that is, either via a recording or orally by the researcher. Participants are instructed to listen to the sentences and to repeat them accurately when prompted to do so. Typically, directions might be as follows: “You will listen to 60 sentences. After every sentence, a prompt [++++] will appear on the screen. Your task is then to repeat the sentence as well as you can. It is important that you do not begin repeating the sentence before the prompt [++++] has been displayed.” The prompt generally occurs several seconds after the end of stimulus presentation so that participants cannot reproduce the sentence based on rote memory alone. The sentences are typically designed to target certain grammatical structures, and the participants’ ability to repeat them accurately is seen as a reflection of their internal grammatical systems. Elicited imitation has been used extensively in first language acquisition research since the 1960s (e.g., Fraser, Bellugi, & Brown, 1963). In second language (L2) research, the technique has gained in prominence as a measure of L2 competence over the past 15 years (see Munnich, Flynn, & Martohardjono, 1994; Erlam, 2006, for examples; see Bley-Vroman & Chaudron, 1994; Vinther, 2002; Jessop, Suzuki, & Tomita, 2007, for overviews).

The basic assumption underlying elicited imitation is that if a participant’s grammatical system corresponds to the grammar used to generate a given stimulus sentence, it should be relatively easy to repeat. If not, accurate repetition should be difficult. For example, English as a second language (ESL) learners with advanced levels of proficiency should have little difficulty in accurately repeating a sentence like “John is going to talk to Mary about the new project in the morning,” while accurate repetition of this sentence might prove too demanding for learners with lower levels of proficiency. The repetition of ungrammatical sentences (“John have went to talking to Mary about the new project in the morning”) should be more challenging than the repetition of grammatical sentences, even though they contain an equal number of words. This is because elicited imitation goes beyond rote memory and repetition; it is a reconstructive process during which participants use

2 PROMPTED PRODUCTION

their own grammatical systems to reproduce stimulus sentences. As Jessop et al. (2007) point out, participants often correct ungrammatical stimuli spontaneously, which they would not do if elicited imitations were simply rote repetitions.

Several important factors need to be taken into account when designing elicited imitation tasks. For example, proficiency levels are important because sentences that might be appropriate for low-proficiency participants might be inappropriate for participants with higher levels of proficiency. In order to ensure that participants cannot simply repeat the sentences based on echoic memory, researchers should check (a) that the prompt occurs after a delay (for example 3–5 seconds), and (b) that the sentences are sufficiently long (for example, between 12 and 17 syllables depending on proficiency). Finally, it is important to select the location of the target structure carefully. It is well known that the first and the last units of a sequence (for example, the first and the last words of a sentence) are generally more salient and therefore better retained than the middle part. In order to avoid bias in a stimulus set, researchers should ensure that the target structure occurs in the same location in all stimulus sentences.

Interactive Tasks

A wide range of tasks have been used in interaction-based research to obtain production data. These include picture description, spot-the-difference, story completion, map, and consensus tasks. Interactive tasks differ on a number of dimensions—for example, information flow (one-way vs. two-way), resolution (open vs. closed), goal orientation of the participants (convergent vs. divergent), and number of possible outcomes (single vs. multiple vs. no outcomes). For a detailed description of interaction tasks, see Mackey and Gass (2005). For examples of three different types of interactive tasks used in a classroom context, see Mackey et al. (in press).

Picture description tasks typically require participants to describe a picture to a partner who cannot see it. Pictures are usually selected by the researcher in order to target a specific grammatical structure. In a typical picture description task, one of the participants is given a picture (e.g., of a park scene) and instructed to describe it to a partner who needs to draw it (see Trahey & White, 1993; Iwashita, 2003, as examples). There are some important considerations to keep in mind when collecting production data by means of picture description tasks. For example, it is important to ensure that the picture cannot be seen by the listener; the drawing should be entirely based on verbal instructions. One way to accomplish this is through the use of a barrier, which can be made of cardboard or even a simple file folder. Participants should also be instructed not to reveal their pictures to their partners. Finally, it is also important to ensure that the pictures are appropriate in terms of vocabulary for the participants' proficiency level.

Spot-the-difference tasks utilize pictures that are identical except for a predetermined number of modifications. Participants are asked to find the differences through verbal interaction (see Iwashita, 2003, as an example). Often, they are told how many differences there are so that they have a goal to work toward. Spot-the-difference tasks require two or more learners to participate, and each holds different information that is vital to the completion of the task. Since information has to be exchanged among participants, spot-the-difference tasks are considered two-way tasks. Another example of a two-way task is the story completion task. In this type of activity, participants are given different parts of a story in written or pictorial form with instructions to work together to make a complete story (see Foster & Skehan, 1996, as an example). In order to construct a story, the learners take turns describing their pictures and attempt to come to a consensus on how to sequence them. As with picture description tasks, it is important to ensure that the pictures in story

completion tasks are appropriate for the level of the participants in terms of vocabulary. With regard to implementation, it is once again important that the participants not see their partners' pictures.

A final example of a two-way activity is the map task (see Gass, Mackey, & Ross-Feldman, 2005, as an example). Here, participants are given a map of a section of a city. Each participant can then be provided with different information about street closings, and they must explain to each other which streets are closed and when. Once this portion is completed, they have to determine a route from point A to point B, keeping in mind that certain streets are closed. In another variation of the map task, learners are given similar maps, but with each map containing different place markers. For example, subject 1 may be given a map marking the location of the library, city hall, and post office, while subject 2 is provided with a map showing the location of the high school, pharmacy, and bank. Each participant is then given a list of locations to find and thus needs to ask a partner for those locations.

Consensus tasks generally involve pairs or groups of participants who must arrive at an agreement on a given question or topic (see Slimani-Rolls, 2005, as an example). For example, participants might be told that ten individuals are stranded on an island, but only five can fit into a boat to return to the mainland. Characteristics are provided for each individual, and participants must decide which five people should be allowed to get on the boat. Consensus tasks may perhaps allow for more open discussion than other tasks since more than one outcome is possible. For this reason, they may provide various opportunities for learners to comprehend input, receive feedback on their output, and modify output by engaging in active discussion from varied perspectives in the course of reaching the consensus. As with other interactive tasks, it is important that the instructions stress the need for all participants to participate.

Narratives

Researchers are often interested in eliciting narratives. Perhaps the most straightforward way to do this is to ask participants to tell someone (either the researcher or another subject) about an event that occurred in the past or that will take place in the future, depending, of course, on what the researcher is interested in eliciting. For example, for tenses, one could ask participants to narrate what they did yesterday, what their typical day looks like, or how they intend to spend their summer vacations. A problem with this approach is that participants can avoid the target structure. A more structured way to elicit narrative production data is through narrations of video clips. Clips tend to be relatively short (2–4 minutes) and provide participants with a uniform prompt from which to speak. Data can be collected by asking participants to narrate or retell a silent film; alternatively, film clips with minimal dialogue are sometimes used (see Gass, Mackey, Alvarez-Torres, & Fernández-García, 1999). Gass et al. (1999), for example, selected film strips from *Mr. Bean* episodes in which the sound could be removed without affecting learners' comprehension, or, as is typical with *Mr. Bean*, very little dialogue was present in the original. This ensures that participants are not influenced by the speech of either their native language or the target language.

An important point to consider when eliciting narratives is planning time. Planning can impact both the quantity and the quality of the narratives, so researchers need to consider whether or not participants are given time to plan their utterances, whether they are allowed to take notes, and, if so, whether they may use those notes during the retelling. When using video clips to elicit narratives, researchers also need to decide whether the narrative should be produced orally or in written format, whether participants tell the story as the film is playing or after it has been shown, and, in the case of oral production,

4 PROMPTED PRODUCTION

whether participants narrate it to the recording device or to someone who they believe has not seen the film.

Role Plays

Role-play tasks provide another way of eliciting production data. Here, participants are presented with artificial situations, which are usually based on real life, and asked to respond naturally. The role play can involve other participants or the researcher. In Turnbull's (2001) study, for example, a screen was placed between researcher and subject. Both had a disconnected telephone as a prop. The researcher then made a pretend phone call and made a request to which the subject had to respond. Their dialogue was recorded for subsequent analysis. Role plays result in more naturalistic language data, especially when participants are not given time for planning. At the same time, the use of role plays can make it more difficult to elicit instances of the target structure. Since there are no specific prompts (say, in the form of pictures or video clips), participants might avoid the use of the target form more easily.

There are, broadly speaking, two types of role plays: open and closed. In closed role plays, participants are presented with scenarios and asked to give one-turn oral responses. For example, participants might be told that they missed a flight because of a delayed wake-up call and would then be asked to respond (e.g., what would they say to the hotel manager to receive compensation?). Closed role plays might not reflect naturally occurring language, but they have methodological advantages. Since they do not require interlocutors, closed role plays can be implemented with relative ease. (Participants could listen to the scenario from a tape, for example, and record their response on the same machine.) In addition, they offer focused opportunities to practice specific linguistic forms that are commonly used in certain speech acts (e.g., requests, apologies, etc.). In open role plays, participants are provided with a scenario (e.g., complaining about a hotel room to a receptionist) and asked to play it out. Participants may or may not be given time to plan their discourse in advance. Open role plays usually reflect natural language use more exactly. Having said that, one must recognize that, just like the other prompted production procedures, role plays are still collected in a non-natural environment (the classroom) and so are subject to some of the same limitations as other prompted production measures.

Prompted Responses

NAOKO TAGUCHI

Prompted responses are data elicited through experimental tasks in which participants do not produce spontaneous language but respond to stimuli in some way. Prompted responses are different from naturalistic data and interviews that are not elicited. Similar to prompted production that also forms elicited data (but in production), prompted responses are considered a reflection of underlying knowledge and processes. This chapter reviews prompted responses in three domains: linguistics, pragmatics, and psycholinguistics.

Linguistics

Within linguistics, knowledge of grammar has been a popular target of examination, owing to the influence of the universal grammar (UG) theory. The theory argues that human beings are born with a universal set of *principles* and *parameters*. *Principles* refer to core grammar common in languages, whereas *parameters* account for differences across languages (Chomsky, 1986). Research in the field of second language acquisition (SLA), an area of applied linguistics, concerns the extent to which UG constrains second language (L2) learners' grammar. To tap the mental representation of learners' grammar, UG research often uses receptive tasks to measure learners' "intuition" about grammaticality of sentences. An advantage of this data type is that, because performance constraints are minimal, the data are assumed to more closely reflect underlying knowledge than production data. This characteristic, however, is also a limitation. Without actual language use, the data do not tell us what learners actually do with the grammatical knowledge.

A common data collection method in UG research is grammaticality judgment tasks in which participants read sentences and indicate whether they are grammatical or not. The tasks allow researchers to investigate whether L2 learners can reject sentences that violate UG principles. See the example below from White and Juffs (1998). They used 30 grammatical and 30 ungrammatical sentences to examine Chinese learners' knowledge of one UG principle—*island constraints*. A movement of a *wh*-word from an embedded clause (b) is not possible, while a long-distance *wh*-movement is possible (a).

- (a) Which man did Jane say her friend likes?
- (b) *Which article did you criticize the man who wrote?

A variation of the grammaticality judgment tasks is magnitude estimation. It examines grammatical knowledge in terms of graduation (i.e., which sentences are more acceptable than others), rather than absolute judgments (i.e., acceptable or not) (Bard, Robertson, & Sorace, 1996). Respondents read and rate the first sentence to indicate how "good" the sentence is. This value serves as the baseline when rating subsequent stimuli. For example, if it is 10 times as good, the value becomes 10 times as large.

Compared with grammar, phonology has received far less attention. Nonetheless, there have been some attempts to measure L2 learners' phonological competence by analyzing errors in the perception of phonological composition. Researchers assume that erroneous decoding in hearing reflects learners' incomplete knowledge of the target phonemic systems.

2 PROMPTED RESPONSES

A common task used to detect phonemic misperceptions is a minimal pair task. Learners listen to pairs of words that differ in only one phonological element (e.g., “pit” and “bit”), which usually reflect a problematic consonant or vowel for learners based on the contrastive analysis. Then they either spell the word they thought they heard or choose it from a list of options. See the example below from Tench (2003) in which Korean learners of English listened to a total of 64 words and wrote down the word they thought they heard:

Target: “pull” /pul/ Ten out of 20 learners spelled it “pool” /pu:l/.

Target: “yeast” /yi:st/ Thirteen out of 20 learners spelled it “east” /ist/.

Pragmatics/Sociolinguistics

Pragmatics and sociolinguistics are concerned with language use in social context. These fields assume that production and perception of language are affected by social variables, such as setting, interlocutor status, and gender. Under this assumption, pragmatics research has examined learners’ knowledge of proper linguistic forms to convey intentions or the strategies they use to project politeness in a particular social encounter. Common response data are the recognition of appropriate pragmatic expressions. The data are assumed to reflect learners’ understanding of situational characteristics (e.g., participants’ power difference and social distance) and their knowledge of preferred linguistic options in the situation. The advantage of this type of data is that the constructs under study are well defined. Researchers can build in the exact context variables in the stimulus situations and preselect the pragmatic expressions to test learners’ knowledge. A limitation is that researchers need to collect baseline data from native speakers to establish the reliability of the correct option. This is not easy because perception of appropriateness may differ among native speakers from different backgrounds.

This type of data has been typically elicited through multiple-choice questionnaires. These questionnaires specify the situational context and provide several response alternatives from which participants must choose. See the example below from Jianda (2007) on the assessment of pragmatic knowledge of apology expressions in English:

Situation: You are a student. You are rushing to the classroom as you are going to be late for the class. When you turn a corner, you accidentally bump into a student whom you do not know and the books he is carrying fall onto the ground. You stop, pick the books up, and apologize.

- (a) Oops, sorry, my fault. I’m in such a hurry. Here let me help pick these up for you.
- (b) I’m sorry, I will be late if I’m not in a hurry. I’ll pay attention to this when I turn corner next time.
- (c) Oh, I’m very sorry. I’m going to be late for my class, and if I’m late, I won’t be allowed to enter the classroom. But I like this course very much. So, sorry again!

As a variation, some studies used a scaled response questionnaire in which learners evaluated the degree of appropriateness of the target expression on a Likert scale.

In sociolinguistics, researchers collect a range of data on speech behavior and its variations across speakers and situations. Likewise, they collect data that reflect people’s reactions to certain speech behavior. Here I will discuss the latter type of data. Reactions toward speech types are relevant data in SLA research because participants are usually speakers of another language who are not identified with the target language group. As a result, their speech tends to elicit certain reactions and impressions from native speaker groups.

A common method used to elicit this type of data is the matched guise test. Speakers who are fluent in two languages or dialects (i.e., guises) are tape-recorded. The recordings are later played in a random order, and participants are asked to judge the speakers' personality and character. Below is a sample questionnaire of prompts from Lambert, Giles, and Picard (1975). Participants were French–American bilinguals and French monolinguals. There were seven speaker varieties over different genders, social classes, and dialects.

What do you think of this person?

- | | | |
|----------------|------------------------|-----------------|
| 1. intelligent | __ : __ : __ : __ : __ | not intelligent |
| 2. active | __ : __ : __ : __ : __ | passive |

This study was intended to determine which language variety was most preferred by which group. This technique allows researchers to focus on assessing the reaction of a participant to a particular speech, controlling for other factors that might influence the reaction. However, like other questionnaire data, the sincerity of the responses is never certain.

Psycholinguistics

Different from linguistics-based researchers in the Chomskyan camp who are interested in the underlying representations of language, psycholinguistic researchers are interested in *processes* that underlie language use. With this focus, psycholinguistics research typically deals with online data, namely data that involve responses to ongoing stimuli, not to a preceding one. Here I will discuss two common types of online data: reaction time and eye movement.

Reaction-time data demonstrate how quickly one can respond to the presented stimuli. An assumption is that longer reaction time represents a greater processing effort. Hence, reaction time is an indirect reflection of ease/difficulty in processing the stimuli and the relative amount of linguistic, cognitive, and affective resources required for processing. An advantage of the data is that they help us to distinguish among linguistics stimuli and tasks according to their processing demands. However, there is one practical limitation of this method. Because it involves analysis of milliseconds, data need to be collected using a computer program, either self-made or commercially available.

A variety of processes have been examined with reaction-time data, such as lexical decision, sentence processing, grammatical judgments, and recognition of formulaic sequences. In lexical judgments, participants make a quick, accurate judgment about a word. The type of judgment varies from study to study. Word versus nonword judgments are a common task where participants decide if the target word forms a real word or not by pressing a “yes” or “no” button. For example, in Segalowitz and Segalowitz (1993), French–English bilinguals judged whether the target letter string presented after the prime formed a real word or not. The prime was either a category name or a meaningless string. Skilled bilinguals were faster to judge that the target word was a real word when it was related to the category name (e.g., target “APPLE” and prime “FRUIT”). Another type of lexical decision is semantic access. Participants decide whether the word refers to a living or nonliving object (e.g., the girl = living; a book = nonliving) (Segalowitz & Freed, 2004).

Reaction-time data have also been used in sentence processing research that examines processing strategies in syntactic parsing. L2 learners are found to transfer their L1-based processing strategies to process L2 input. When L1 and L2 strategies are not compatible, learners draw different interpretations, leading to incorrect understanding of the target

4 PROMPTED RESPONSES

grammar. The competition model research has examined this premise (MacWhinney & Bates, 1989). In this model, surface forms, such as word order, animacy, and morphological markings, are termed “cues,” and reliance on a specific cue is considered to be a preferred processing strategy. For example, when reading a sentence like “Tom ate pizza,” English speakers tend to rely on word order and animacy cues to identify the agent of the action. However, in Japanese, case markings are a dominant cue because the agent is often marked with the subject-marker particle “ga.” This cross-linguistic difference was found to affect processing strategies. L2 Japanese learners with L1 English background showed reliance on the animacy and word order cues, but not on the case-marking cue, when identifying the agent (Sasaki, 1994).

Eye movement tracking has a relatively short history, but it has become increasingly popular in reading and syntactic processing research. The data are often collected via a self-paced reading task. Participants read sentences or text on a computer screen while cameras track the movement of eyes. An assumption is that eye movement reflects underlying processing mechanisms—what parts of linguistic input learners attend to most, whether their eye fixation patterns differ from those of native speakers, and whether they regress like native speakers upon encountering ambiguous input. An advantage of this type of data is that, because eye movement is unconscious human behavior that one cannot easily regulate, the data could suggest a close reflection of underlying processes. The practical limitation is that researchers have to purchase eye-tracking equipment and get trained.

Roberts, Gullberg, and Indefrey (2008) analyzed eye movement to examine online resolution of ambiguous pronouns in L2 Dutch. Participants were native Dutch speakers, German learners of Dutch, and Turkish learners of Dutch. Dutch and German are non-null subject languages where overt subject pronouns are obligatory, whereas in a null subject language, like Turkish, they are optional. Participants completed a self-paced reading task that contained a series of Dutch texts:

Peter en Hans zitten in het kantoor. Terwijl Peter aan het werk is, eet hij een boterham.
Peter and Hans are in the office. While Peter is working, he is eating a sandwich.

In the example above, the referent of the pronoun “he” is ambiguous. The eye tracker recorded gaze location every two milliseconds, and the positions of eye fixations were analyzed for the time spent reading the region in which pronoun resolution took place. Results revealed similar eye fixation patterns among L2 readers regardless of their L1 backgrounds.

Pronunciation Assessment

LUKE HARDING

Introduction

Pronunciation assessment is perhaps the oldest recorded form of language assessment. The Book of Judges in the Old Testament describes the process by which the Gileadites identified and prevented the fleeing Ephraimites from crossing the River Jordan by enforcing the Shibboleth test:

And the Gileadites took the passages of Jordan before the Ephraimites: and it was so, that when those Ephraimites which were escaped said, Let me go over; that the men of Gilead said unto him, Art thou an Ephraimite? If he said, Nay; Then said they unto him, Say now Shibboleth: and he said Sibboleth: for he could not frame to pronounce it right. Then they took him, and slew him at the passages of Jordan: and there fell at that time of the Ephraimites forty and two thousand. (Judges 12:5–6, King James Version)

In common parlance, the term “shibboleth” has come to refer to any type of sign which reveals an underlying social identity. Within the field of applied linguistics, the story of the Shibboleth has been used to highlight the way in which language tests may be used to separate in-group and out-group members (McNamara, 2005). However, it is important to understand that the Shibboleth was, first and foremost, a pronunciation test; and one which demonstrates clearly that the manner in which we articulate the sounds of a language can sometimes elicit severe judgment.

This entry will provide an overview of pronunciation assessment, with a focus on the evaluation of pronunciation ability in second language learners. It will begin with a description of the main purposes for which pronunciation assessments are made. Following this, it will outline some of the common methods which are currently used to assess pronunciation. Finally, the challenge of defining a construct for pronunciation assessment will be discussed.

Purposes for Assessing Pronunciation

Perhaps the most prominent purpose for pronunciation assessment in the field of applied linguistics is the measurement of pronunciation skills in a second language, either for diagnostic purposes (e.g., in establishing what areas of pronunciation a student might need particular help with), for achievement testing (e.g., to assess whether a certain feature has been effectively learnt), or for language proficiency assessments. In classroom-based contexts (for diagnostic and achievement purposes) pronunciation assessment may take the form of a “stand alone” measure conducted solely for the purpose of evaluating a student’s ability to produce the sounds of the target language accurately. However, in the case of proficiency testing—particularly large-scale proficiency tests such as Cambridge ESOL examinations, the Test of English as a Foreign Language (TOEFL®), and the Test of English for International Communication (TOEIC®)—pronunciation usually features as one component within the broader construct of speaking ability.

2 PRONUNCIATION ASSESSMENT

Pronunciation assessments are also made for a variety of other reasons within applied linguistics and related fields. First, it may be necessary to gain a measure of pronunciation ability for research purposes in order to compare an individual's pronunciation with other variables of interest. Second, assessment may be made for forensic purposes in order to draw conclusions about individuals' backgrounds on the basis of samples of their speech; for example, in identifying a specific speaker who has left threatening messages on a telephone (e.g., Rose, 2002), and more recently, as part of a "language analysis" through which asylum seekers' claims of their country of origin may be verified (though for a critique of such practices see Eades, Fraser, Siegel, McNamara, & Baker, 2003; Eades, 2005). Finally, pronunciation assessments are regularly made in clinical contexts by speech therapists. In such situations, a "phonological assessment" is used to diagnose specific speech problems, or to evaluate the effectiveness of intervening treatments (see Grunwell, 1993).

Methods of Pronunciation Assessment

The range of methods commonly used in the assessment of pronunciation in all of the domains described above may be understood as falling somewhere within a grid formed by two intersecting continua: from "holistic" to "analytic" approaches; and from "impressionistic" to "objective" approaches (see Figure 1). Holistic approaches take the form of global judgments of a speaker's pronunciation which are more likely to be made during assessment tasks that elicit extended discourse. Analytic approaches involve assessments of accuracy of discrete (or "atomistic") features of pronunciation (e.g., appropriate use of stress, appropriate use of intonation, appropriate use of schwa) measured against a pre-established norm. These are more likely to be made in conjunction with tasks that are specifically designed to elicit certain phonological features of interest. On the vertical axis, impressionistic approaches are those in which assessments are made by human raters (ranging from untrained "lay" raters to highly trained linguists or speech scientists), while objective approaches may involve the use of techniques from instrumental phonetics, automated scoring of speech, or objective tests (e.g., transcription tasks in the measurement of intelligibility).

In the case of second language pronunciation assessment, many of the best-known communicative English-language exams would fall somewhere within the holistic-impressionistic quadrant: with judgments made by human raters against scoring criteria which consist of global descriptions of pronunciation ability across a range of proficiency levels (even as they occur within the context of analytic rating scales for speaking). The

Figure 1 Methods of pronunciation assessment

International English Language Testing System (IELTS), a large-scale English-language examination developed by Cambridge ESOL, the British Council, and IDP Australia, provides an example of a typical case. In IELTS, pronunciation is assessed as one of four analytic criteria in the speaking test, alongside “fluency and coherence,” “lexical resource,” and “grammatical range and accuracy.” From the information provided in the public domain speaking descriptors (see http://www.ielts.org/PDF/UOBDS_SpeakingFinal.pdf), a score on the pronunciation criterion is derived from a global evaluation which focuses on three broad features of a candidates’ pronunciation: range, effectiveness/control, and “intelligibility” (an estimate of how well a speaker is understood; though see Isaacs, 2008, for a discussion of competing definitions of this term from an assessment perspective). The descriptive statements for Bands 8 and 6 are shown below:

Band 8

- uses a wide range of pronunciation features;
- sustains flexible use of features, with only occasional lapses;
- is easy to understand throughout; L1 accent has minimal effect on intelligibility.

Band 6

- uses a range of pronunciation features with mixed control;
- shows some effective use of features but this is not sustained;
- can generally be understood throughout, though mispronunciation of individual words or sounds reduces clarity at times.

A candidate’s pronunciation is assessed as being at one band or another during his or her performance over the entire speaking test, which consists of three separate speaking tasks: (a) answering questions about yourself and your family, (b) speaking about a particular topic, and (c) engaging in a longer discussion about the same topic. The assessment is made by a single rater who is specially trained, and who undergoes regular moderating sessions. The score on the pronunciation criterion is then combined with scores on the other analytic criteria to arrive at a total speaking score (of which pronunciation is an equally weighted component).

This holistic-impressionistic model of pronunciation assessment, with variations (e.g., the number of raters used; whether rating is conducted “live” or with recordings of a candidate’s speech; the nature of speaking tasks; whether the criterion is labeled “pronunciation,” “delivery,” or “intelligibility”), has been the standard approach to pronunciation

Table 1 Phonological control in the CEFR (Council of Europe, 2001, p. 117)

C2	As C1
C1	Can vary intonation and place sentence stress correctly in order to express finer shades of meaning.
B2	Has acquired a clear, natural, pronunciation and intonation.
B1	Pronunciation is clearly intelligible even if a foreign accent is sometimes evident and occasional mispronunciations occur.
A2	Pronunciation is generally clear enough to be understood despite a noticeable foreign accent, but conversational partners will need to ask for repetition from time to time.
A1	Pronunciation of a very limited repertoire of learnt words and phrases can be understood with some effort by native speakers used to dealing with speakers of his/her language group.

4 PRONUNCIATION ASSESSMENT

assessment in communicative language testing for a number of years. It is the basic method used across the full range of Cambridge Main Suite examinations, as well as tests produced by Educational Testing Service (ETS), such as the TOEIC® and the TOEFL®, and in specific-purposes language tests such as the Occupational English Test (OET). A notable feature of this communicative approach is the way in which pronunciation ability is assessed not only in terms of a speaker's accuracy in forming segments and using stress and intonation, but also in terms of how well that speaker is understood by a listener, as demonstrated in the descriptive statements for the IELTS bands shown above. This dual focus has also found expression in the Common European Framework of Reference (CEFR) where pronunciation is covered under the banner of "phonological control" (see Table 1). In this scale, comprehensibility is highlighted ("pronunciation is generally clear enough to be understood . . .) although at some points the focus is on specific features of articulation ("can vary intonation and place sentence stress correctly").

Because of the focus in communicative language testing on the effectiveness of a speaker's pronunciation for achieving clarity and conveying meaning, it has been natural to use human raters. However, this is often a time-consuming and costly element of test administration, and allows for subjectivity in the assessment process, particularly as speech intelligibility is commonly thought to involve both speaker- and listener-related factors (see Pickering, 2006, for an overview of this research). Recently, though, newer technologies have afforded the opportunity for test designers to expand into the automated scoring of speech, an area which holds much promise for the design of pronunciation assessments. The Pearson Test of English (PTE) Academic (as well as the Versant™ tests of English, Spanish, and Arabic) currently uses technology developed by Ordinate® to capture and score speech through an automated system. Within this system, pronunciation is assessed (together with other features of spoken performance) through statistical models that compare a candidate's performance with a large database of spoken performances that have previously been assigned scores by human raters. Interestingly, although the assessment of pronunciation through these methods is objective, and could presumably provide data on atomistic features of pronunciation in the PTE Academic the results are mapped onto one global score for "pronunciation" (one of six "enabling skills"), as well as contributing to item scores on speaking and integrated skills tasks.

In fact, analytic methods of pronunciation assessment are rare in the area of second language testing. Although several have been proposed in research literature (see Van Weeren & Theunissen, 1987; Koren, 1995), they have not been operationalized in high-stakes contexts. This is no doubt because it would be difficult to construct a test that measures discrete features of articulation within the prevailing communicative paradigm. Yet in many clinical and forensic domains, pronunciation assessment tends toward the analytic side of the spectrum in that specific features of pronunciation are often the focus of the assessment process. In these cases, assessments will be based either on impressionistic judgments, usually made by speech therapists, phoneticians, and other speech scientists, or on objective measurements (whether manual or automated) of the acoustic properties of recorded speech which may then be compared statistically with existing data sets of pronunciation patterns in the target community.

Challenges in Defining the Construct

One of the most significant challenges for pronunciation assessment—particularly in English-language testing contexts—is the existence of what Levis (2005) calls "two contradictory

principles”: the nativeness principle and the intelligibility principle. The former refers to the idea that language learners should aspire towards a native-like accent in the second language, while the latter represents the idea that learners should aim to be understood by a broad range of listeners (including native and non-native speakers). The nativeness principle represents an orthodox approach to pronunciation pedagogy; however, the intelligibility principle has been supported by research that shows that a native accent is not necessarily the most intelligible variety for all listeners (Jenkins, 2000), and that although some features of second language phonology may be very noticeable to listeners, and may influence perceptions of strength of accent, they do not necessarily interfere with how well a speaker is actually understood (Derwing & Munro, 1997).

Yet although the focus of many current pronunciation assessments has shifted from a focus on “nativeness” to milder statements concerning accuracy and degree of listener effort, there are still many examples of pronunciation criteria for speaking tests that conflate both of Levis’s principles. For example, the description on the Cambridge ESOL Common Scale for Speaking relating to pronunciation in the Certificate of Proficiency in English (CPE)—the highest level of the Cambridge Main Suite examinations—states that “pronunciation is easily understood and prosodic features are used effectively; many features, including pausing and hesitation, are ‘native-like’” (Cambridge ESOL, 2008, p. 70). Part of the problem is that researchers are still far from determining what features of pronunciation contribute more or less to intelligibility. For example, suprasegmentals seem to be more important than segmental features (see Hahn, 2004), but the accurate production of segmental features will also be crucial in particular contexts (see Zielinski, 2008). Without such descriptions it has been difficult to establish what specific features of pronunciation should be made prominent in scales of pronunciation ability. There is an urgent need to develop a better description of how those features that contribute to intelligibility develop, particularly at the top end of the proficiency spectrum; otherwise, testing practitioners who design rating scales will end up resorting to “native-like accent” statements to distinguish these levels.

Conclusion

As pronunciation assessments continue to develop and be shaped by technology, an overarching issue remains: the social impact of pronunciation assessments, and the consequences of decisions which are made on the basis of scores. Although the Shibboleth is an extreme case, it highlights one of the most important issues for pronunciation assessment: While it is often primarily concerned with evaluating the comprehensibility of a speaker, pronunciation is such a salient social marker that any type of assessment practice must be understood as occurring within a social context in which certain accents are more valued than others (see Bourdieu, 1977). Standards which are evident in the trajectory of rating scales will filter back into pedagogy and possibly into wider views in the community about who has an “acceptable” accent and who does not. It is within this social context that a large market exists for “accent reduction” courses, many in particular aimed at learners of English as a second language. In this regard, pronunciation assessment is an area of language testing where issues of proficiency and identity intersect in unique and challenging ways, and those designing or using assessments need to tread carefully.

Pronunciation in World Englishes

DAVID DETERDING

Introduction

There are a huge number of speakers of English around the world, and many of them use varieties of English that no longer look to the speech of people in places such as the UK and the USA for their norms. This article describes the pronunciation of World Englishes.

A range of models has been proposed to represent varieties of World English. Here, reference is made to the Three Circles model (Kachru, 2005, p. 14), which was first developed in the 1980s. Although there are some weaknesses in this model, particularly because it is historically and geographically based, and furthermore some countries cannot easily be classified (Jenkins, 2009, pp. 20–1), it does provide a useful framework for the description of World Englishes.

Kachru classifies varieties of World English in terms of three circles (see Figure 1). The Inner Circle consists of the traditional sources of English, such as the UK, the USA, and Australia. The Outer Circle includes places which had a colonial link with the UK or the USA and which have now adopted English as an official language. Examples are Singapore, India, Nigeria, and the Philippines. Finally, the Expanding Circle consists of territories where there was no colonial link to Britain or the USA but where English is increasingly used as a language of commerce and international communication. Such places include China, Germany, and Brazil.

Figure 1 The Three Circles of English (adapted from Kachru, 2005, p. 14)

2 PRONUNCIATION IN WORLD ENGLISHES

Some characteristics of the pronunciation found in most Inner Circle Englishes are use of dental fricatives [θ] and [ð] at the start of words such as *think* and *this*; regular occurrence of reduced vowel in unstressed syllables, especially the weak forms of function words; and use of stress-based rhythm. These features are often absent in Outer Circle Englishes.

Here, a brief overview is offered for some of the features of English pronunciation in four Outer Circle countries: Singapore, Nigeria, India, and the Philippines. In each place, there is substantial variation in the English that is spoken, depending on such things as the ethnic and educational background of the speaker and the level of formality of the interaction. Nevertheless, there are features in each place which characterize the variety and which often provide a clear indication about where the speaker comes from.

Despite the great differences in the pronunciation of English around the world, there are also some features shared by a range of Outer Circle Englishes, and these may become increasingly acceptable as part of the norm for the pronunciation of English as it is used internationally. Such features are considered in this article.

Finally, brief consideration is given to the Englishes that are emerging in the Expanding Circle. Although speakers from these places still generally look to the Inner Circle for their norms, the sheer weight of numbers of Expanding Circle speakers means that the way they speak English will have an increasing impact on the international use of the language. Furthermore, many (e.g., Kirkpatrick, 2007) have argued that it is inappropriate for Expanding Circle territories always to have to refer to Inner Circle styles of usage, as it is demotivating for the English of teachers in the Expanding Circle always to be regarded as erroneous.

Essential to the description of World Englishes is the adoption of a descriptive stance and the avoidance of prescriptive language. Therefore, for the vowels, reference is made to the key words suggested by Wells (1982), so we can say that FACE may be pronounced as a monophthong [e:] or as a diphthong [eɪ] without suggesting either is “better.” For consonants, we will sometimes use upper-case letters, specifically for the TH sounds (e.g., at the start of *think* or *three*), so we can say that voiceless TH can be pronounced as [θ], [t], [s], or [f] without indicating any of these is “correct.”

Singapore English

English has been used in Singapore ever since it became a British colony in 1819, and it has been the primary medium of education throughout the school system since 1987, even though all children are also supposed to become fluent in one other language, their so-called “mother tongue”: Chinese, Malay, or Tamil. There is substantial variation in Singapore English, and most speakers regularly switch between a colloquial variety (often called “Singlish”) and a more formal variety depending on the situation. However, we can still identify a number of features that characterize Singapore English, even if they are not found in all styles of speech. The features described here are from Deterding (2007, pp. 12–39):

- Initial voiceless TH tends to be [t] at the start of words such as *thing* and *three*.
- The final sound may be omitted in words such as *first* and *world*.
- The DRESS and TRAP vowels are merged, so *send* and *sand* are homophones.
- The FACE and GOAT vowels are monophthongs.
- There is often no distinction between long and short vowels, so words such as *pool* and *pull* as well as *feast* and *fist* are homophones.
- A full vowel occurs in the unstressed first syllable of polysyllabic content words such as *compare* and *consider*.
- A full vowel is found in function words such as *of*, *that*, and the auxiliary verb *had*.
- There is syllable-based rhythm.

Nigerian English

Nigeria was a British colony from 1914 to 1960, and English was retained as an official language after independence, partly because it favors none of the different ethnic groups. There are a huge number of indigenous languages in Nigeria, and the English pronunciation of speakers depends to some extent on the ethnic background of the speaker, particularly whether it is one of the three main groups, each of which represents about 20% of the population: Hausa, Yoruba, and Igbo (Kirkpatrick, 2007, p. 102). Nevertheless, some common features can be suggested for the English spoken in the country. The following summary is extracted from Gut (2004):

- Voiceless TH is either [t] or [s], depending on the ethnic background of the speaker.
- The final sound is omitted in words such as *hand* and *post*.
- [g] occurs at the end of *sing* and *hang*.
- There is no distinction between the TRAP and PALM vowels.
- The FACE and GOAT vowels are monophthongs.
- There is a full vowel in the first syllable of *police* and also the final syllable of *sofa* and *resentment*.
- There are no weak forms for function words such as *but* and *the*.
- There is syllable-based rhythm.

Indian English

The British had a colonial presence in India from 1612 until independence in 1947 (Sailaja, 2009, p. 97). After independence, it was intended that Hindi would supplant English in all official domains after a transitional period of 15 years, but in fact English maintained its position even after that period, partly because of reluctance to use Hindi in the south of the country. Although India is a massive country, with a huge range of indigenous languages which can influence the English that is spoken, nevertheless there are some features of English pronunciation that seem to be found quite widely and which might be regarded as characteristic of “Indian English.” The following features are based on Sailaja (2009, pp. 17–38):

- Voiceless TH is a voiceless dental plosive at the start of *things* and *thought*.
- A retroflex consonant occurs at the start of *today*, *terrific*, and *demand*.
- There is no distinction between /v/ and /w/.
- The FACE and GOAT vowels are monophthongs.
- There is a [g] at the end of *sing* and a [b] at the end of *climb*.
- Weak forms for function words are often avoided.
- There is syllable-based rhythm.

Philippine English

The Philippines is interesting for the description of emergent World Englishes because, unlike Singapore, India, and Nigeria, it was a colony of the United States rather than Britain, from 1895 till 1946. As a result, Philippine English is rhotic, with a clear [r] sound in words such as *four* and *cart*. Investigation of the pronunciation of English in the Philippines therefore allows us to consider the extent to which features of World Englishes extend among all newly emergent varieties, not just those historically derived from British English. The following features are based on Tayao (2008):

4 PRONUNCIATION IN WORLD ENGLISHES

- Voiceless TH tends to be [t].
- For some speakers, [s] occurs at the start of *zebra* and *shoe*.
- For some speakers, [s] occurs at the end of *buzz* and *bush*.
- The TRAP and PALM vowels tend to be merged.
- The FACE and GOAT vowels are monophthongs.
- Reduced vowels are avoided.
- There is syllable-based rhythm.

Shared Features

Each of the varieties has its own features, so for example many Singaporeans make no distinction between the DRESS and TRAP vowels, some Nigerians have [g] at the end of *sing*, Indians may use retroflex [t] and [d] and also conflate /v/ and /w/, and some speakers from the Philippines do not distinguish /s/, /z/, and /ʃ/. However, there are also features that seem to be shared by all these varieties, and it is possible that these common features constitute elements of an emergent “Outer Circle World English.” Such features include avoidance of dental fricatives; monophthongal FACE and GOAT; a relative absence of reduced vowels; and syllable-based rhythm. Each of these shared features is now considered in turn, and then we consider their impact on intelligibility.

Voiceless TH

The avoidance of the dental fricatives [θ, ð] is widespread in Englishes throughout the world, not just in Outer Circle varieties, but also in a few Inner Circle ones, including those of London, Ireland, and New York (Wells, 1982, pp. 328, 428, 515). This avoidance is not surprising in Outer and Expanding Circle varieties given that most other languages do not have dental fricatives and many speakers find them difficult.

The sound that is adopted for initial voiceless TH in Englishes around the world differs: [t] seems to be the most widespread in Outer Circle Englishes, including Singapore, India, the Philippines, and some speakers from Nigeria, but [s] is found with other speakers in Nigeria, and [f] is found in Hong Kong English (Deterding, Wong, & Kirkpatrick, 2008). We might also note that [t] and [s] are both common in Expanding Circle Englishes, with [s] being found in China (Deterding, 2006) and Germany (Swan, 1987).

The FACE and GOAT Vowels

In many varieties of British and American English, the FACE and GOAT vowels are realized as closing diphthongs. In fact, in some Inner Circle varieties, especially those of Australia and New Zealand, the diphthongal movement is quite substantial, and the vowels might be represented as [ɹɪ] and [ɹʊ] (Wells, 1982, pp. 597, 609).

However, FACE and GOAT seem generally to be monophthongal in most Outer Circle varieties of English (Kachru & Nelson, 2006, p. 38), not just those we have considered, but also in places such as Jamaica, West Africa, and East Africa (Gramley & Pätzold, 2004, pp. 270, 320, 324), though a few Outer Circle Englishes seem to be an exception to this rule, such as that of Hong Kong (Deterding et al., 2008).

Reduced Vowels

There is a shared tendency among Outer Circle Englishes for the use of full vowels rather than reduced vowels, not just in the unstressed syllables of content words such as

the first syllable of *compare* and *police*, but also in some function words such as *of* and the subordinator *that*. Vowel reduction has a direct effect on rhythm, so we consider these two issues together.

Rhythm

The relative absence of reduced vowels may substantially contribute to the perception of syllable-based rhythm in many Outer Circle varieties. Although claims about fixed categories of rhythmic timing in languages have recently been questioned (Roach, 2009, p. 110), the observation that some Outer Circle Englishes have a more syllable-based rhythm than Inner Circle varieties is common. In addition to the four varieties described here, syllable-based rhythm has been reported for the Englishes of East Africa (Gramley & Pätzold, 2004, p. 323), Jamaica (Trudgill & Hannah, 2008, p. 117), and Hawaiian Creole (Wells, 1982, p. 651).

Crystal (1995) notes that Inner Circle Englishes also sometimes exhibit syllable-based rhythm, for example in baby talk, many types of popular music, and some television commercials. He further suggests that syllable-based rhythm might one day become the norm even in Inner Circle Englishes (Crystal, 2003, p. 171), and he advises against fostering norms of rhythm where they are not appropriate (2003, p. 172).

Intelligibility

It has been shown that although there are substantial differences between the Englishes found in the various Outer Circle countries, some features seem to be shared, particularly the avoidance of dental fricatives, a monophthongal quality for FACE and GOAT, the avoidance of reduced vowels, and syllable-based rhythm. Jenkins (2007) has proposed a *lingua franca core* (LFC), a set of pronunciation features that are essential for successful international communication; and we might note that all the shared features mentioned here would fit well within her LFC proposals.

We might consider further what effects these shared features have on intelligibility, especially since it has long been established that Inner Circle varieties of English are not always the most intelligible for listeners around the world (Smith & Nelson, 2006). Of course, intelligibility is hard to measure, and so it is not straightforward to determine if any particular feature of pronunciation might help or hinder the chances of a speaker being understood by a range of listeners; but we can note that the language of air traffic (“Airspeak”) is one of the domains that Crystal identifies as exhibiting syllable-based rhythm “because of the need to articulate with extra clarity” (1995, p. 175). And it further seems likely that use of full vowels instead of reduced vowels in unstressed syllables can help in improving intelligibility, at least for the kind of short, critically important utterances that characterize the language of air-traffic control. One might additionally note that the official radio telephony manual for pilots stipulates that both *three* and *thousand* should be pronounced with an initial [t], so it seems that this common Outer Circle realization of voiceless TH has become the recommended norm in Airspeak.

Given that there are now almost certainly more Outer Circle than Inner Circle speakers of English around the world (Crystal, 2003, p. 61), one might further speculate how the features of pronunciation that are shared by a wide range of Outer Circle speakers might influence the future evolution of English. It seems likely that these features will have a substantial impact on the way the language develops, and even if many speakers in the Inner Circle will undoubtedly continue to speak using traditional Inner Circle styles of pronunciation, it is probable that styles of speech shared among a range of Outer Circle Englishes will become increasingly accepted throughout the world.

The Expanding Circle

So far, the focus has been mostly on Outer Circle rather than Expanding Circle Englishes, partly because Outer Circle varieties tend to be more advanced in the process of evolving into mature, independent varieties which no longer refer to the Inner Circle for their norms (Schneider, 2007). In contrast, Expanding Circle varieties still generally derive their norms of pronunciation from the Inner Circle, so their status as independent varieties of English is less certain.

However, by some counts the majority of English speakers in the world today are actually in the Expanding Circle (Crystal, 2003, p. 61). In fact, one single country, China, may have more speakers of English than the whole of the Inner Circle combined, though of course there is huge variation in their competence in English. Let us briefly consider here some of the features of the pronunciation of English by speakers in China, particularly how these features differ from Outer Circle Englishes. The following items are extracted from Deterding (2006):

- Voiceless TH tends to be [s] at the start of words such as *think*.
- There is often an extra vowel at the end of words such as *and* and *first*.
- The final nasal consonant may be omitted from words such as *sun*, and the preceding vowel gets heavily nasalized.
- The consonant in the middle of *usual* is often [ɹ] rather than [ʒ].
- Vowel reduction is avoided in function words.
- There is syllable-based rhythm.

Note that the absence of reduced vowels in function words and the use of syllable-based rhythm are shared with Outer Circle Englishes, though other features, such as [s] for voiceless TH, the insertion of a vowel after word-final consonants, and the occurrence of [ɹ] in *usual*, make Chinese English distinct from most Outer Circle varieties. Only time will tell what influence the huge numbers of English speakers in China and other Expanding Circle countries might have on the future of English.

Conclusion

We have seen that there are many shared features among the various Outer Circle Englishes, although each variety also has its own distinguishing features. Some of the shared features are furthermore found in Expanding Circle Englishes in places such as China. It is suggested that these shared features may have an increasingly substantial impact on the future evolution of English worldwide.

Pronunciation Instruction

TRACEY M. DERWING

History

Pronunciation instruction has been around for as long as people have been learning languages other than their mother tongues. The fact that much of the research in this area has focused on English is partly due to its status as a global language. English pronunciation materials for “outlanders” go back at least as far as 1665 when Owen Price, a Welsh schoolteacher, first published a manual describing the organs of speech (Price, 1665). Interest in the topic came to a head in Britain in the early 20th century when phoneticians such as Daniel Jones turned their attention to accent, with his book *The Pronunciation of English* (1927) serving as a standard for teaching learners of English. Later in the century, Brazil, Coulthard, and Johns (1980) made contributions to describing the language, and Cruttenden’s (2008) version of *Gimson’s Pronunciation of English* is still widely used.

In North America, interest in pronunciation teaching has waxed and waned, depending on the predominant approach to English as a second language (ESL) at the time. During the 1960s and 1970s, when the audiolingual method was popular, accurate pronunciation was highly emphasized. Some of the so-called designer methods also focused on pronunciation, but none more so than the Silent Way. Its creator, Caleb Gattegno, used a color code system to represent sounds, and severely limited the vocabulary of beginner students to ensure that they would be able to place most of their attention on the pronunciation of the new language.

With the advent of communicative language teaching, particularly in “inner circle” countries (Australia, Britain, Canada, New Zealand, and the USA), pronunciation took a back seat in many classrooms. It was assumed that with enough exposure to the second language (L2), learners’ pronunciation would eventually approximate native-like patterns. Although some notable researcher/practitioners advocated for the teaching of pronunciation, such as Morley (1991), language programs tended to avoid the incorporation of pronunciation instruction into their curricula during the last two decades of the 20th century. Research on pronunciation to inform pedagogy was also limited during this period (Brown, 1991). However, more recently there has been increased interest in pronunciation teaching, as evidenced, for example, by greater availability and range in materials, special issues of journals devoted to pronunciation (e.g., *TESOL Quarterly*; *Prospect*; *Language Learning and Technology*), a speech, pronunciation, and listening interest section within TESOL, an annual international conference dedicated to pronunciation (Pronunciation in Second Language Learning and Teaching), and the creation of an international listserv as a forum for researchers and practitioners.

Terminology

Key concepts related to pronunciation instruction include “intelligibility,” “comprehensibility,” and “accentedness.” Despite the different interpretations of these terms, the most common meaning of intelligibility is the extent to which a listener actually understands

2 PRONUNCIATION INSTRUCTION

the productions of an L2 speaker. This can be measured using transcriptions of dictations, comprehension questions, true/false questions, or summaries of a speaker's productions. In L2 research, comprehensibility is often understood to be a scalar judgment of how easy or difficult L2 speech is to understand, whereas accentedness is a rating of the degree of difference between an L2 speaker's productions and the local variety of the language in question (Derwing & Munro, 2009). These three conceptualizations, although partially independent, are related in a complex manner. It is possible, for instance, for an L2 speaker to have heavily accented speech, yet be both intelligible and easy to understand to interlocutors. An individual who is unintelligible and difficult to understand, on the other hand, will always be judged as having heavily accented speech. Finally, it is possible for a speaker to be intelligible, yet difficult to understand, requiring significant effort on the part of the listener. The implication of the complex interplay of these dimensions for pronunciation teaching is that merely reducing accent should not be the goal of either the learner or the teacher, since only the enhancement of comprehensibility and intelligibility is likely to lead to improved communication. Another implication of this interplay is the importance of determining which aspects of an L2 learner's pronunciation interfere with intelligibility and comprehensibility. When that knowledge is available, a pronunciation teacher can select those features that will have the most constructive impact on a learner's speech.

While a lay understanding of the term "accent" may include any differences from local norms (such as phonological divergences, lexical choice, grammar, and culturally determined pragmatic behavior), in pronunciation teaching circles the term is usually limited to differences in suprasegmental and segmental productions. Suprasegmental aspects of language (prosody) refer to rhythm, stress, intonation, tempo, and voice quality, whereas segmentals are individual speech sounds (vowels and consonants). It is important to recognize that an L2 accent is not a speech pathology; it is a normal feature of L2 speech, particularly in language acquisition after early childhood. It is also noteworthy that pronunciation is not synonymous with either "phonology" or "phonetics," as is sometimes assumed. Finally, L2 pronunciation entails both perception (how one interprets what he or she hears) and production (the articulation of the new language). Thus pronunciation is a cognitive process (Fraser, 2010) that also involves motor skills; however, many textbooks tend to focus on the latter, although the former is more important.

Why Pronunciation Teaching Matters

Despite the crucial role pronunciation plays in oral communication, L2 instructors are often reluctant to teach it (Burns, 2006), sometimes because they feel ill-equipped to determine what their students' needs are, and how to address them (MacDonald, 2002). Notwithstanding their teachers' trepidation, L2 learners, in general, put a high premium on pronunciation instruction (Couper, 2003).

Although some learners study a second language for reading purposes only, most ESL and many English as an international language (EIL) students have the intention of listening and speaking in their L2. For the latter two groups, comprehensible pronunciation is as essential to successful communication as appropriate vocabulary and grammar are. Some L2 learners have no difficulty understanding their target language interlocutors or making themselves understood in the absence of explicit pronunciation instruction. However, for those L2 speakers who consistently experience intelligibility problems (both receptive and productive), appropriate pronunciation teaching can ease their frustration while at the same time help them to become more comprehensible to their interlocutors. Individuals in certain occupations, such as air traffic controllers, require wholly intelligible

speech; their comprehension should not be hampered by misperceptions in their own processing of input, and their productions should require little or no effort to understand at all times and under less than optimum conditions. Special pronunciation courses may be needed for potential employees in these positions.

A clear understanding of pronunciation issues is also important to many L2 speakers for social and psychological reasons. Immigrants, particularly, are apt at some point to experience some negative reactions to their L2 accents. Often such encounters, although unpleasant and potentially demoralizing, are relatively inconsequential, but there are many documented instances of prejudice that have led to unfair dismissal from work, and failure to employ a qualified job applicant or to provide housing to an L2 speaker (Munro, 2003). It behooves an instructor to discuss cases like these with students, and to help them understand their rights. Accent is also intricately tied to personal and group identity. Identity may be expressed in many different ways; some learners may wish to sound as target-like as possible, while others may want to retain aspects of their L1 phonology while speaking in their L2 to show group membership. Yet others may choose to vary those aspects of their L2 pronunciation that are volitional, depending on the interlocutor. Accent discrimination and identity are topics of high interest in the language classroom, and are worthy of discussion. Furthermore, conversations about the responsibilities and assumptions of interlocutors would be beneficial, again to promote learners' confidence and awareness of their own rights (Derwing & Munro, 2009).

Research on Pronunciation Teaching

Although numerous laboratory studies have investigated the improvement of learners' perception and production of L2 segmentals and suprasegmentals, the focus here is on classroom L2 pronunciation instruction. Only a few classroom studies have appeared in the literature, and not all of them have addressed intelligibility. Perlmutter (1989) conducted research showing that L2 immigrants to the USA exhibited significantly improved intelligibility after six months of instruction with a substantive focus on pronunciation. Unfortunately, because there was no control group, we cannot know for certain whether the improvement was a direct result of the instruction, or whether it could be attributable to the natural improvement that is typical of most newcomers in their early months of immersion in a second language (Flege, 1988).

In a later study, MacDonald, Yule, and Powers (1994) compared an ESL control group with learners who received one of three approaches to pronunciation instruction: explicit correction of errors, self-study in a language lab, and interactive feedback. Speech samples from the participants were collected prior to the interventions, immediately after, and two days later. The authors indicated that their results were inconclusive. Several factors disallowed generalizations from the study: the sample was small, the instructional timeframe was extremely short, and the exposure to type of instruction was not balanced.

Derwing, Munro, and Wiebe (1997) collected speech samples before and after a 12-week pronunciation-specific course focusing on suprasegmentals. The learners in the study had lived in an L2 environment for an average of 10 years, and their general proficiency in English ranged from high intermediate to very advanced. When untrained listeners transcribed sentences that had been randomized from the two data collection points, the postinstruction utterances were found to be significantly more intelligible.

In a follow-up study, Derwing, Munro, and Wiebe (1998) conducted a classroom-based experiment in which one class of ESL learners received 20 minutes of suprasegmental instruction per day for 10 weeks; a second class received a similar amount of segmental instruction; and a third class served as a control group, receiving no specific pronunciation

4 PRONUNCIATION INSTRUCTION

instruction. Note that this study did not compare different methods, but rather, the comparison was between different types of pronunciation content. All participants read a set of sentences aloud and provided picture narratives before and after the instructional period. These speech production data were then evaluated in two listening experiments. In the first, untrained listeners rated the before/after sentences on 9-point scales for comprehensibility and accentedness. Both the suprasegmental and the segmental groups showed improvement on both measures, whereas the control group made no gains in comprehensibility. The picture narratives were a more difficult task, because the learners had to decide on lexical choice, grammatical form, and discourse organization, as well as pronunciation accuracy. Six experienced ESL teachers rated the 48 narratives for comprehensibility, accentedness, and fluency. In this task, the suprasegmental group showed significant improvement in both comprehensibility and fluency, but the performance of the segmental and control groups was judged not to have improved over time. The authors concluded that both the task (sentence or narrative) and the focus of instruction (suprasegmental or segmental) influenced the results. They recommended that instructors address both suprasegmental and segmental aspects of pronunciation, indicating that the former seemed most helpful in extemporaneous productions, while the latter would be useful in instances of communication breakdown, when L2 speakers could focus on their phonological productions if they were aware of particular words or sounds that regularly caused them problems.

Couper (2003, 2006) conducted two classroom studies in which he compared his own L2 students' pronunciation errors before and after instruction. In both instances, the researcher ensured the students became explicitly aware of their problems, focusing on metalinguistic explanations of issues such as epenthesis, and pointing out regular patterns in English phonology. The students also received ongoing feedback on their productions. In both studies, the students showed improvement over time in the pronunciation features that were addressed.

Saito and Lyster (2011) examined the effects of form-focused instruction with and without corrective feedback (feedback was restricted to recasts) with Japanese learners of English. The form in question was the initial consonant in "run." More than four hours of communicatively based instruction presented to three groups of learners resulted in no change in the productions of the target sound in the control group (no form-focused instruction) or in the form-focused group that received no corrective feedback. However, the group that received recasts showed significant improvement. The authors concluded that it is essential for learners to receive feedback to let them know whether their productions are accurate enough, but that this feedback can occur in a meaning-based lesson with contextualized use of language.

Although most pronunciation classroom studies have relied on immediate posttests (or, in the case of Saito and Lyster, a test two weeks after instruction), Hahn (2002) assessed L2 learners' productions of nine patterns of stress before a pronunciation course, immediately after, and again at a much later time. Most of her participants' scores were higher at the third testing point than they were prior to instruction, although all but one student experienced some backsliding. More work on learners' retention of newly acquired skills is clearly needed. In particular, it would be useful to determine whether sporadic tutorials could secure improved retention and ongoing development.

There is still a paucity of classroom-based research on pronunciation instruction. Ongoing assessment of students who have completed pronunciation training is necessary to determine how long the effects of instruction last, and whether improved pronunciation leads to increased exposure to the target language. Research designs similar to Hahn's (2004) investigation of primary stress should be conducted with a range of accent variables, both separately and in combination, to determine their influence on intelligibility and comprehensibility.

What to Teach

Although the nativeness principle, “that it is both possible and desirable to achieve native-like pronunciation in a foreign language” (Levis, 2005, p. 370), is firmly held by many in the accent reduction industry, most pronunciation specialists agree that intelligibility and comprehensibility should be the guiding foundations for developing a pronunciation curriculum or incorporating pronunciation into a general L2 class (Jenkins, 2002). There are some thorny issues, however, that the instructor must address. First, who are the interlocutors with whom the learners will communicate? Jenkins (2002) has proposed a “core” of pronunciation features, primarily segmentals, that she argues should be taught to EIL students who regularly interact with other EIL speakers. In immigrant settings, learners are more likely to communicate with speakers of the local variety of the target language, but they may also interact extensively with L2 speakers of other languages. To identify learners’ problem areas, pronunciation instructors may have to conduct individual assessments of learners, relying on their own comprehension of the students’ speech and that of the others in the class. A needs analysis of students’ speech should encompass factors such as general speaking habits (e.g., volume), a range of suprasegmental features, rate, voice quality, and certain segmentals, all of which have been shown to affect intelligibility.

Aspects of the L2 students’ productions that seem most problematic for intelligibility or comprehensibility, or both, should be addressed first. For example, if a student speaks so quietly that it is difficult to hear any part of the message, regardless of the quality of the suprasegmentals or segmentals, work on enhancing volume is necessary. If a suprasegmental feature such as primary stress is consistently misassigned, intelligibility will be compromised (Hahn, 2004). Functional load, a hierarchy of minimal pairs proposed by Catford (1987), suggests the order of importance of segmentals in English. To date, the only experiment testing Catford’s hypothesis (Munro & Derwing, 2006) confirmed that high functional load pronunciation errors have a greater impact on comprehensibility than do those carrying low functional load. This finding indicates that when teachers assess their students’ productions they should not be guided by salience alone. Human beings are extremely sensitive to differences in accent; in fact, Major (2007) demonstrated that people are able to detect foreign accents in languages that they do not speak. Nonetheless, some of those differences have little or no effect on comprehensibility, however salient they may be (e.g., the interdental fricatives in English).

Instruction must also take into consideration contextualized uses of language. There is a tendency, particularly in pronunciation textbooks, to focus attention at the sentence, word, or individual phoneme level. As Levis and Pickering (2004) have demonstrated, intonation at the discourse level is not well represented when only sentence-level illustrations are provided. In their study on speech visualization of intonation, Levis and Pickering argue for the use of technology in teaching pronunciation at the discourse level.

Materials/Technology

The resources available for teaching English pronunciation have multiplied greatly in the last decade. Not only are there more textbooks for use with students, there are many more resources that utilize the computer, in the form of CDs or online courses. Celce-Murcia, Brinton, and Goodwin (with Griner) (2010) have reissued a substantially revised edition of their teacher resource book, which is a mainstay of many teacher preparation and ESL programs, along with two CDs that illustrate both general American speech and L2 accented English. In Australia there has been a strong focus on pronunciation teaching in recent years, and the government has underwritten the production of materials that are available

free on their Web sites. A downloadable handbook on teaching pronunciation (see Suggested Readings) explains why L2 learners may have difficulty conceptualizing sounds in their new language. Several other textbooks intended for preservice teachers have appeared on the scene, but new student resources have virtually exploded. As instructors and language program coordinators make choices for new software or online courses, they should take to heart the caveat “Buyer beware.” There are exciting innovations in technology that can enhance learners’ perception and production (Pennington & Ellis, 2000; Levis, 2007), but potential purchasers should conduct some research themselves before their students invest time and money.

Who Should Teach Pronunciation?

The people best suited to teaching pronunciation are L2 instructors with formal training themselves in pronunciation, listening, and speaking pedagogy. Unfortunately, many L2 teachers have had limited or no opportunity to obtain this background, and for this reason, some may avoid pronunciation altogether, while others may rely heavily on resources that may not address their learners’ needs (MacDonald, 2002). A lack of expertise has not stopped entrepreneurs, who have filled a niche with accent reduction programs of questionable or even negative value (Derwing & Munro, 2009). The Internet has thousands of examples of programs that are one-size-fits-all, regardless of students’ L1, and regardless of their own problems, which, in some cases, may be idiosyncratic. Another sector has also implemented accent reduction programs: many speech pathologists attract L2 clients for remediation purposes (Derwing & Munro, 2009). If a learner has a genuine pathology that interferes with intelligibility (e.g., a severe stutter) then a speech pathologist may certainly provide appropriate guidance, but in the case of L2 speakers who have no pathology, instructors who have a clear sense of second language acquisition and L2 pronunciation pedagogy are better equipped than a speech therapist to provide suitable instruction. Of course, a speech pathologist who has also studied the learning and teaching of a second language would have the skills necessary to appropriately assist an L2 speaker.

University and college TESOL programs have a responsibility to provide their students with appropriate credit courses in pronunciation pedagogy, to give them the confidence and capability to design suitable activities and provide feedback for L2 learners. It is essential that teachers gain this expertise; if they do not, they may rely on intuitions that actually mislead their students. For instance, Wang and Munro (2004) determined that Mandarin and Cantonese students had been taught that the primary distinction between the vowels in “sit” and “seat” was one of duration. Although there is a difference in the duration of these two sounds, vowel quality is actually the principal cue in North American English. However, teachers without adequate training directed students to focus on what was a secondary cue. In a brief training experiment, the authors were able to successfully change the perceptions of their participants by explicitly pointing out the difference in vowel quality. Similarly, instructors may encourage their students to slow their speech when, in fact, the problem may be some other aspect of their pronunciation that causes longer processing time on the part of the listener. It is crucial that pronunciation teachers not only understand the basic underpinnings of the sound system of the language they are teaching, but that they appreciate that their learners often attend to the L2 as though it were their L1. As a result, the students’ categorization of speech sounds and suprasegmentals does not match that of the L2. In general, it is the role of teachers to establish where their students’ problems lie. Although many instructors have developed excellent intuitions over the years, if we are to see extensive improvement in pronunciation teaching, universities and colleges must implement more teacher preparation in this area.

Future Directions

As teaching pronunciation gains more currency in language classrooms, it is important that researchers continue to investigate which aspects of L2 pronunciation have the most deleterious effects on intelligibility and comprehensibility, taking into consideration speech factors both in isolation and in combination. Most research on pronunciation teaching thus far has been carried out in English; more work in other languages is necessary. Computer technology offers considerable promise, but the extent to which technology instruction extends to free production should be explored. The role lexical frequency plays in the acquisition of certain segmentals should be clarified, as should the relationship between pronunciation and the learning of formulaic chunks. The effectiveness of various approaches to teaching pronunciation should be determined. Finally, ways to enhance interlocutors' willingness to listen to accented speech should be studied in greater detail.

Pronunciation Models

DAVID DETERDING

Introduction

Many nonlinguists imagine that a model of pronunciation which is upheld as the standard, promoted in schools, and is the focus of reference materials such as dictionaries, is somehow better than a regional variety, and that people who speak a nonstandard variety are lazy. In contrast, linguists believe that all varieties of a language are linguistically equal, and that it is generally fortuitous if one style of pronunciation becomes adopted as the standard while others do not. Indeed, the style of speech that emerged as the standard pronunciation of English was based on the pronunciation found in the south of England simply because the court and government were based there (Mugglestone, 2003).

In many countries, standards are promoted by an official body, such as the L'Académie Française in France. In contrast, for English the standard is a *de facto* one, and there is no regulating body to determine what is "correct" and what is not. Nevertheless, models for English pronunciation have evolved, and they continue to be encouraged by the worldwide English-teaching industry.

Here, the two most commonly used models of English pronunciation are compared: received pronunciation British English (RP) and general American (GA). Then some alternative models of English pronunciation are mentioned, and there is a discussion of an alternative focus for language teaching derived from English as it is used as a lingua franca by non-native speakers (Jenkins, 2007). Finally models of pronunciation for two other major world languages, Chinese and Malay, are briefly considered.

RP versus GA

RP (Cruttenden, 2008) and GA are the accents most widely adopted as the basis for models of English pronunciation around the world, especially for teaching materials, and these two styles of pronunciation are the ones that are shown in the two best known pronunciation dictionaries, Jones, Roach, Hartman, and Setter (2003) and Wells (2008), even though there are actually rather few native speakers of RP and some writers observe that GA does not really exist (Preston, 2005).

The most salient difference between RP and GA lies in the occurrence of /r/: in RP, /r/ is only pronounced when it occurs before a vowel, while in GA it is pronounced wherever "r" occurs in the spelling, including in words such as *four* and *cart*. We call RP a non-rhotic accent, while GA is rhotic.

Some other differences between RP and GA are:

- RP has /ɒ/ in words such as *lot* and *cloth*, but GA has /ɑ:/.
- RP has /ɑ:/ in words such as *path* and *class*, but GA has /æ/.
- In RP, the medial sound in words such as *better* is [t], but in GA it tends to be a flap [ɾ].
- The medial /l/ in words such as *really* is a clear /l/ in RP but a dark /l/ in GA.

2 PRONUNCIATION MODELS

- Some words such as *temporary* and *secretary* in GA have a secondary stress on the *-ary*, but in RP these words have a single stress on the first syllable.
- Some individual words differ. For example, RP usually has /aɪ/ in the first syllable of *either*, but many speakers of GA have /i:/; and in RP there is an /h/ at the start of *herb*, but not in GA.

Despite these differences, RP and GA are usually mutually intelligible, partly because the ease of global communication in the modern world ensures that speakers of these varieties get to hear each other's pronunciation quite regularly. Cruttenden (2008, p. 77) notes that in the 1930s people in Britain found American pronunciation hard to understand, but such difficulties have now by and large disappeared because of widespread exposure to American films.

Other Models of English Pronunciation

Schneider (2007) describes how varieties of English around the world often follow a similar trajectory in developing their own norms, gradually eschewing reference to external varieties such as RP or GA. For example, Australia now has its own distinctive style of pronunciation, and few Australians aspire to sound as if they come from Britain. Similarly, people in Scotland, Wales, and Ireland have their own standards of pronunciation which are independent of RP.

What have been termed “new varieties of English,” such as that of Singapore (Deterding, 2007), are also increasingly evolving into independent varieties. Schneider (2007, p. 160) observes that Singapore English is in the fourth phase of a five-phase cycle of development, and it seems likely that, in time, it will progress to become a completely mature variety with its own standards for pronunciation and usage.

Teaching Based on English as a Lingua Franca (ELF)

Nowadays, most English speakers around the world do not have the opportunity or the desire to speak to people in places such as Britain and the USA. Jenkins (2007) argues that if speakers of English from countries such as China and Germany can communicate perfectly well with those from Brazil and Japan, their pronunciation should not be judged against that of a native speaker. The goal should be to achieve easy intelligibility, and it is irrelevant how native speakers might say things. She therefore proposes a lingua franca core (LFC) of just those features of pronunciation that are essential for international intelligibility, and she suggests that teaching should be based on this. The LFC includes most of the consonants of British and American English, vowel quantity (i.e., the long/short distinction) and sentence stress, but it excludes the dental fricatives, vowel quality, and lexical stress placement (Jenkins, 2007, pp. 23–4).

However, the proposals for LFC-based teaching are controversial. For example, Trudgill (2005) has argued that there is nothing wrong with a model of pronunciation based on a native-speaker variety such as RP.

Despite this ongoing debate, many now agree with the basic premise that teaching models should take into consideration local forms of pronunciation and should no longer adhere unquestioningly to external standards (Kirkpatrick, 2007).

Models of Pronunciation for Chinese and Malay

It might seem strange that RP and GA are so widely used as models of English even though there are few speakers of RP and GA is something of an artificial construct. However, the promotion of a minority style of pronunciation as the standard is actually quite common. Here we will consider models for Chinese and Malay.

In China, a standard form of the language is important as a unifying factor in a country so large and diverse. The standard model for pronunciation in China is called Pǔtōnghuà, 'Common Language', and it is based on the accent of Beijing. It is also promoted in Taiwan, where it is called Guóyǔ, 'National Language', and in Singapore, where it is called Huáyǔ, 'Chinese Language' (Chen, 1999, pp. 31–2), even though hardly anyone in either Taiwan or Singapore actually speaks a form that is close to the Beijing norm. One salient difference between the language as it is specified and as it is actually spoken by most people in Taiwan involves the retroflex fricative and affricates /ʂ, tʂ, tʂʰ/, the sounds that are written as "sh," "zh," and "ch" in the Pinyin system of spelling (Duanmu, 2007, p. 24). In Taiwan, these tend to be merged with the corresponding dentals /s, ts, tsʰ/, which are written as "s," "z," and "c" in Pinyin, with the result that 树 'shù' ('tree') may sound the same as 速 'sù' ('speed').

Just as with China, Malaysia is a large country with many different people, and that is one reason why a standard language is promoted, to build unity among the various people. Malay is the standard language of Malaysia, where it is called Bahasa Malaysia. It is also the official language of Brunei Darussalam and the national language of Singapore, and in both these countries it is referred to as Bahasa Melayu. It is quite similar to the national language of Indonesia, where it is called Bahasa Indonesia (Prentice, 1990). The model for pronunciation of Standard Malay is based on the accent of southern Johor. However, this style of pronunciation is used by few people. In Brunei the language that is actually used by nearly everyone is a dialect of Malay called Brunei Malay, which is substantially different from Standard Malay (Martin & Poedjosoedarmo, 1996). For example, Brunei Malay only has three vowels /i, a, u/ rather than the six vowels of Standard Malay /i, e, a, o, u, ə/. So once more, we find a model of pronunciation promoted as the standard even though few people actually speak it.

Conclusion

Norms of pronunciation are promoted in many modern nations, even though the varieties that are adopted are often actually spoken by few people. For English, the norms are currently being questioned by many scholars who suggest that models based on English as a lingua franca are more appropriate. Nevertheless the existing norms seem likely to persist for some time, as they are seen as important by governments and essential for language teachers.

Pronunciation Teaching Methods and Techniques

JANET GOODWIN

Pronunciation teaching has traditionally focused on articulating individual consonant and vowel sounds (known as the *segmental* features). Conventional techniques include imitation (*listen and repeat*), articulatory explanations (“*Put your tongue here . . .*”), minimal pair exercises (*ship* vs. *sheep*), tongue twisters (*she sells seashells by the seashore*), and reading aloud. As communicative language teaching principles gained currency, greater emphasis was given to global elements such as stress and intonation (known as *prosody* or the *suprasegmental* features). Current methodology acknowledges the importance of segmentals as well as suprasegmentals, emphasizing how they function as an interdependent system. The pronunciation of any language should be presented as it naturally occurs—in the stream of speech, not as an isolated skill. Since this entry uses examples based on English, important features of other languages, like the teaching of tones in Mandarin or Vietnamese, will not be explicitly addressed. That said, effective pronunciation teaching involves: (a) understanding the basic sound system features of the language being taught, (b) setting realistic goals for learner achievement, (c) having an overall plan for instruction, and (d) incorporating a variety of techniques, tools, and technology.

Understanding the Basic Features of Pronunciation in English

Pronunciation is a way of packaging our speech for the listener. Speakers use pauses and intonation to divide their speech into coherent chunks. The listener’s attention is drawn to the main point or element of a chunk through a rise or fall in pitch. Other meaningful words in the chunk may also be stressed but any words that a listener can figure out through grammar or context are usually not spoken clearly at all; they are simply squeezed into the intervals between stressed syllables. The pattern of stressed and unstressed syllables creates a rhythm that listeners use to comprehend what they hear, helping them to anticipate what a speaker will say next and to fill in gaps in comprehension. Although words are traditionally taught as having a fixed sequence of consonant and vowel sounds, as shown in the dictionary, this pronunciation may represent only the highly stressed form of a word. The unstressed form, if even recognizable as an individual word, might sound significantly different in the stream of speech.

Thought Groups

Just as punctuation guides the reader in processing written text, speakers use pauses to create coherent segments of speech, commonly referred to as *thought groups* (also *tone units* or *intonation units*). Consider the following phrase: *Woman without her man is nothing*. One set of pauses would produce this:

Woman / without her man / is nothing.

2 PRONUNCIATION TEACHING METHODS AND TECHNIQUES

while the meaning would change dramatically if the speaker paused at these points:

Woman / without her / man is nothing.

Thought group boundaries often occur between grammatical units, such as a clause or phrase:

The man you are looking for / doesn't work here anymore.

Although the frequency and placement of pauses vary in real speech, thought groups are a necessary component to making our speech comprehensible to a listener.

Intonation

Intonation, or “the melody of speech,” is the pattern of rising and falling pitch within a thought group. Multiple conventions are used to represent intonation for learners:

- a musical staff showing pitch levels:

Extra high	
High	do
Mid	How are you
Low	ing?

- Arrows:
How are you doing? ↗↘

- Contours:

How are you doing? ↘

Intonation patterns have traditionally been taught as corresponding to particular grammatical forms, such as fall-rise for yes/no questions (*Have you met him?*), or rise-fall for wh-questions (*What's he like?*). A broader look at intonation takes both the listener and the extended discourse into account, revealing how speakers use intonation to achieve a particular communicative purpose, such as backgrounding information the listener is assumed to know, or taking a turn in a conversation (Wennerstrom, 2001; Chun, 2002; Celce-Murcia, Brinton, & Goodwin, 2010). Moreover, intonation helps listeners comprehend a string of words as a coherent unit:

We need to / uh / kind of / get going.

Although the speaker has paused, the intonation contour signals that these words belong to a single thought group.

Prominence

The rise or fall of pitch in the intonation unit usually occurs on the *prominent* syllable (also called *focus*, *emphasis*, *primary phrase stress*, *tonic syllable*, or *nuclear stress*). In general, speakers give prominence to new information or to emphasize a contrast. What a speaker

chooses to highlight depends greatly on what was said previously. Notice how the same phrase can have a different prominent word depending on the question that was asked:

<i>What are you doing?</i>	<i>I'm <u>LEAV</u>ing</i> (highlighting the action)
<i>Who's leaving?</i>	<i>I'<u>M</u> leaving.</i> (highlighting the doer)
<i>Why aren't you leaving?</i>	<i>I <u>AM</u> leaving!</i> (contradicting an incorrect assumption)

In her study of the impact of missing or misplaced prominence, Hahn (2004) found this feature played a significant role in intelligibility.

Rhythm

Whereas prominence is the extra emphasis given to one main element in a thought group, *sentence stress* refers to all the stressed words in the phrase. In English, *content words* (e.g., nouns, main verbs, adjectives) are generally stressed while *function words* (e.g., determiners, pronouns, prepositions) usually are not. *Rhythm* is the pattern created by an alternation of these stressed and unstressed syllables. Consider the following example in which content words are represented by uppercase letters and function words by a contracted or reduced form:

The GIRLS've EAT'n sm CAKE
 ●○●○●○
 da DUM da DUM da da DUM

The rhythm of this phrase can be highlighted through the use of bubbles or nonsense syllables. Three syllables are stressed (*girls*, *eat*, and *cake*) but only the final one, *cake*, is prominent.

Word Stress

Each multisyllabic word in English has one highly stressed syllable, known as the primary stress. *Word stress* (also referred to as *syllable stress* or *lexical stress*) is often marked in dictionaries by a small raised line in front of the stressed syllable: /'læŋgwɪdʒ/. Speakers make stressed syllables salient for the listener by making them longer, louder, higher, or all of the before mentioned in pitch. Vowel quality is also key—the vowel in an unstressed syllable may be reduced to /ə/ or /ɪ/ but the vowel in a stressed syllable remains clear; notice how only the second (stressed) syllable in *banana* is spoken with a full, unreduced vowel: /bə'nænə/.

Stress placement can depend on such factors as word origin, part of speech, or affixation. For example, the primary stress typically shifts to the syllable right before these common suffixes: *-ic* (eLECTric), *-ity* (elecTRICity), *-ion* (electrifiCation), and *-ical* (eLECTrical). Most practitioners agree that new words should be acquired along with their stress pattern. Accurate word stress is a significant component of intelligibility (Field, 2005; Zielinski, 2008).

Connected Speech

In *connected speech*, word boundaries can be blurred. Speakers generally pause between thought groups, or during hesitations, but not after each and every word. In fast speech, syllables blend together in a variety of ways:

4 PRONUNCIATION TEACHING METHODS AND TECHNIQUES

Syllables may be linked together by a consonant sound or glide:

An apple (sounds like annapple)

Final consonants may shift to the next syllable:

They lived in Chicago. (sounds like live-din)

Two adjacent sounds may be articulated as a single new sound:

Why can't you? (sounds like canchu)

Sounds may be omitted:

He gave her a gift. (sounds like gaver)

Unstressed function words are usually shortened and their vowels reduced:

It lasted for four hours. (sounds like fur not four)

Native speakers use these shortcuts to ease communication. However, for non-native listeners, these modifications might render a familiar word unrecognizable in speech. For examples of how the pronunciation of a word can vary, visit Cauldwell's *Speechinaction* website (www.speechinaction.net/SPARC_FSU.htm).

Consonant and Vowel Sounds

Because sounds do not consistently correspond to a single letter or sequence of letters, phonetic symbols are used to represent pronunciation. Most dictionaries designed for English language learners use a modified form of the International Phonetic Alphabet (IPA). Whether a teacher chooses to introduce phonetic symbols may depend on the learner's age, proficiency, and goals.

Consonants are commonly illustrated in a chart showing place of articulation (where the sound is made), manner of articulation (how the sound is made), and voicing (whether the vocal cords are vibrating or not). This information can be conveyed through demonstrations and simple oral descriptions such as “/p/ is a sound with lips together” or “/z/ is a sound that makes your throat vibrate and can be held.” Consonant clusters, in which two or more consonants are articulated in a row, as in the beginning and end of the word *strength*, can be particularly challenging for learners whose languages do not permit clusters.

Vowels constitute the core of the syllable, the sound that resonates and can most easily be lengthened. Vowels are distinguished by tongue position (front/central/back), tongue and jaw height (high/mid/low), degree of lip rounding, and the tension of the muscles (tense vs. lax). The pronunciation of vowels can vary markedly from dialect to dialect. Vowel charts with clickable sound files comparing British and American English can be found at Dillon's phonetics resources site at the University of Washington (<http://faculty.washington.edu/dillon/PhonResources/vowels.html>).

For a learner-friendly resource on how both vowels and consonants are articulated, visit the University of Iowa's *Phonetics: Sounds of American English* site, which includes animated graphics and video (www.uiowa.edu/~acadtech/phonetics/). It is important to remember that learning sounds in isolation is not sufficient. Understanding how a sound is articulated in real speech, or how crucial it is to intelligibility, is clear only when it is taught in context using authentic materials.

Setting Realistic Goals for Instruction

Pronunciation instruction, often labeled “accent reduction,” can instead be viewed as “accent addition,” acknowledging the value of the learners’ previous language background (Kjellin, 1999). Viewed in this way, pronunciation teaching does not seek to “fix a broken accent” or to erase a speaker’s L1 identity; the primary goal is successful communication between speakers and listeners. As Brown (1991b, p. 45) observes, “a speaker may be more intelligible or less intelligible to a listener, depending on who the particular listener is, rather than on the clarity of the speech itself.”

These insights have led to greater respect for accent diversity. Since no one accent is dominant in every context, neither teachers nor learners need to sound like an idealized “native speaker.” Instead, teachers—both native and non-native—should consider the multiple communicative situations their learners will face and, with the benefit of technology, incorporate authentic examples of these accent models into the classroom. Mastery of a particular regional accent may or may not be the learner’s ultimate goal.

Traditionally, teachers have struggled to teach the entire sound system, much like a course in phonetics for linguists. However, no pronunciation course can teach everything; teachers need to set realistic and limited goals for instruction by making use of various resources. One important resource is the research on intelligibility in a particular context (Derwing, Munro, & Wiebe, 1998; Jenkins, 2000, 2002; Hahn, 2004; Zielinski, 2008). Teachers can also use the findings from a *contrastive analysis* to pinpoint potential difficulties for learners of a particular L1 (see Avery & Ehrlich, 1992; Swan & Smith, 2001; Walker, 2010). *Functional load*, the frequency and relative importance of a linguistic contrast, can help instructors decide whether a particular sound contrast, even if problematic, is worth addressing (Catford, 1987; Brown, 1991a; Munro & Derwing, 2006). Finally, teachers can tailor instruction for a specific learner or group of learners by obtaining a diagnostic speech sample and by having learners complete a questionnaire about their motivation and communicative needs.

Planning Instruction

Successful pronunciation instruction enables learners to understand and be understood, to make effective use of the language input they receive, to review and revise their speech, and to gain confidence in their ability to communicate. The framework below guides teachers in organizing pronunciation instruction in a five-stage process: description and analysis, listening discrimination, controlled, guided, and communicative practice (Celce-Murcia et al., 2010).

Initially, the teacher describes the feature and how to produce it, presenting multiple examples in natural contexts. In analysis activities, learners may apply rules or patterns to a new sample of speech, for example:

Directions: Put a slash (/) where the speaker might pause:

Hi, Jessica, it’s Angela. Could you call me back when you get this message? I wasn’t sure what the homework was for tomorrow’s math class. Thanks, bye.

In the listening discrimination stage, learners identify or distinguish similar pronunciation features. One common technique involves discriminating between two words which are identical except for one sound, known as a *minimal pair*:

Listen and mark the appropriate response:

The teacher collected/corrected the homework yesterday.

- ___ a. Oh no! I forgot to hand it in!
- ___ b. I wonder how many I got wrong.

Practice with both extended listening and individual phrases is essential. Any authentic speech sample can be used for focused listening practice by having learners identify occurrences of a specific feature, such as connected speech.

Controlled practice activities focus almost exclusively on accuracy, primarily through reading aloud and choral repetition (see Gilbert, 2008, on the benefits of choral repetition). Practice texts should be relevant to learners' speaking needs—for learners who work in healthcare, the transcript of a medical interview might be suitable; for graduate teaching assistants in Chemistry, a transcript describing lab safety procedures is more appropriate.

In guided practice activities, learners formulate more of their own language as they gain control of the targeted feature. For example, learners preparing for a job interview might describe previous work experience while focusing on -ed and -s endings:

I have worked in accounting for 5 years.

I handled multiple accounts.

I supervised three employees.

During the final communicative stage, learners focus on the content of what they are saying. With sufficient practice in the earlier stages, learners are able to maintain control of the targeted features during activities such as role plays, debates, and interviews.

In each of the five stages, learners need feedback to determine if they are correctly perceiving or producing a particular feature. In listening activities, this may be a simple right or wrong answer. In small group exercises, peers as well as the instructor can provide feedback. During communicative activities, error correction is often delayed until the activity is completed, using notes taken during the performance.

Techniques, Tools, and Technology

Pronunciation practitioners employ a variety of resources to enhance instruction. Many techniques and tools are drawn from regular listening and speaking methods; others come from related disciplines, such as theater and speech pathology. Instructional technology has revolutionized the teaching of pronunciation in many ways; it provides access to models and practice opportunities outside the classroom as well as capturing the learner's speech for review.

Effective pronunciation instruction appeals to multiple senses. Sounds can be associated with a visual such as colors or key words (e.g., *blue shoe* for /u/). An understanding of rhythm can be enhanced by having learners make a physical gesture (e.g., clap or tap) on each stressed syllable. Relaxation and visualization exercises at the beginning of a lesson can help reduce learner anxiety.

Drama and imitation techniques offer discourse-level practice with stress, intonation, and connected speech. For example, learners can watch a brief TV or film clip, mark the pronunciation cues they notice onto a copy of the script, rehearse the scene with a partner, and finally review a recording of their performance and compare it to the original (Goodwin, 2005). Imitation techniques include *shadowing*, in which learners repeat along with or slightly after a speaker, and *mirroring*, where learners repeat the lines and mimic the speaker's movements (Hardison & Sonchaeng, 2005).

Pronunciation teaching is more effective when carried out with physical props. A pocket mirror allows learners to check whether lip position and mouth movements match a visual

model. Gilbert (1994) popularized the use of thick rubber bands and kazoos. The rubber band is stretched whenever pronouncing a stressed syllable and relaxed on each unstressed syllable. Speaking through a kazoo obscures individual words thereby highlighting intonation.

Common game formats can be adapted to address pronunciation. In conventional dominoes, players match tiles with the same number of dots; Hancock (1995) has players match either rhythm patterns ("How do you do?" and "Where did he go?") or vowel sounds ("wait" and "gave"). Bingo cards can be used for sound practice, substituting minimal pair words for numbers.

Other popular language teaching tools can have a pronunciation focus. Songs provide both listening discrimination and production practice (for examples of song exercise formats, see Miller, 2006). Poetry is commonly used to target rhythm and vowels. Comic strip dialog often contains examples of reduced speech (e.g., *gonna*, *wanna*, *hafta*) or prominence (usually in boldface type or capital letters). Knock-knock jokes can be used to illustrate features of connected speech. In the example below, the punch line comes from the similarity between "Jamaica" and a fast speech rendition of "did you make a."

- A: Knock knock.
 B: Who's there?
 A: Jamaica.
 B: Jamaica who?
 A: Jamaica mistake?

One of the most valuable tools for teaching pronunciation is technology. The traditional language laboratory has evolved into a multimedia computer laboratory with expanding audio and video resources, pronunciation software, and Internet capabilities.

Voice recording allows learners to review their speech, access multiple pronunciation models, control the pace, amount, and type of practice, and receive individual feedback. Sound files can be created using free programs such as *Audacity* (www.audacity.sourceforge.net). One way to manage the load of responding to student recordings is to advise learners in advance of which feature to focus on and then limit feedback to that one feature. Teachers can note errors on a checklist, a student-generated transcript, or the text of the exercise. Learners can gain self-monitoring skills by submitting a self-review along with the recording.

Video is now available through DVDs, video podcasts, speech analysis displays, and video-sharing websites such as *Youtube*. Commercial video programs include complete pronunciation courses (Meyers & Holt, 2001, 2002) and teacher resource videos illustrating teaching techniques (Meyers & Holt, 1998; Burns & Claire, 2003). An increasing number of inexpensive pocket camcorders produce video that is easily uploaded to a Web site. Filming student role plays and presentations creates a powerful tool for self, peer, and instructor feedback.

Instructional software offers a variety of pronunciation models and extensive practice. The challenge is in letting learners know what error they have made and how to correct it (Levis, 2007). Two pronunciation programs with favorable reviews are *Streaming Speech* (www.speechinaction.com) and *Connected Speech* (www.proteatextware.com.au). Although it requires some expertise in phonetics, the free software program *Praat* (www.fon.hum.uva.nl/praat/) allows users to make voice recordings, import sound files, and view analysis tools such as waveforms, spectrograms, or pitch contours displays. Viewing a visual representation of intonation—both a target utterance and the learner's attempt to match it—is promising (Hardison, 2004; Levis & Pickering, 2004; Chun, 2007).

Internet technology provides access to sound, video, and sophisticated graphics. Learners can see how sounds are produced (www.uiowa.edu/~acadtech/phonetics/), watch video pronunciation lessons, practice distinguishing sounds (www.manythings.org/pp), hear

the pronunciation of words in online dictionaries (www.m-w.com), and practice imitating real speakers (www.englishcentral.com). Virtual language laboratories can be created through online courses or supplementary course Web sites using course management systems such as *Moodle* (<http://moodle.org/>) or *Blackboard* (www.blackboard.com/). Within such a Web site, tools such as *Wimba* (www.horizonwimba.com) offer a central location for recordings.

In summary, the goal of pronunciation instruction is for learners to interact successfully in the actual communicative situations they face or will face outside the classroom. These situations may include a variety of accents, not a single “native-speaker” variety. Rather than teaching the entire sound system, teachers make pedagogical choices based on the communicative importance as well as the teachability of an item, recognizing that both suprasegmental and segmental features contribute to intelligibility, since they function in speech as an integrated whole. A systematic approach to instruction enables learners first to notice new patterns in the target language and then to incorporate these patterns gradually into their speech. A wide variety of techniques and tools as well as continuing advances in instructional technology provide a solid methodological repertoire for the teacher of pronunciation.

Psycholinguistic Approaches to Vocabulary

GRETCHEN SUNDERMAN AND ALICIA CAMPBELL

A psycholinguistic approach to vocabulary is aimed at understanding how individuals store words in their mental dictionary, how they retrieve those words, and how their level of proficiency in each language affects lexical processing. The cornerstone of psycholinguistic approaches to vocabulary is the use of behavioral methods to measure how quickly (using reaction times in milliseconds) and accurately individuals process language. The nature of the questions and the experimental tasks vary when investigating individuals at beginning stages of bilingualism (i.e., language learners) and more skilled individuals (i.e., proficient bilinguals).

Lexical Storage

Over the years scholars have attempted to describe the organization of lexical knowledge in the bilingual mind. A well known and widely cited early proposal in the bilingualism literature is that of Weinreich (1968). Weinreich hypothesized that there were three types of lexical arrangements in bilinguals resulting from their different language experiences: coordinate, compound, and subordinate. Coordinate bilinguals learn each language in a separate environment and therefore each word has its own specific semantic representation. The coordinate bilingual would then have two sets of meanings and two lexical entries, both independent of each other. Weinreich's compound bilinguals are described as having learned the two languages in the same context, resulting in one semantic representation for each concept. The compound bilingual would then have one meaning linked to two independent lexical entries. Finally, Weinreich describes the subordinate bilingual as different from both the coordinate and compound bilingual in that the subordinate bilingual uses the dominant language as a filter for the second language. For example, if the bilingual's weaker language is Spanish, the word *libro* may evoke the word *book*, which will then access the meaning for that word. Thus, the subordinate bilingual has a primary set of meanings established through the first language, a primary lexical representation in the dominant language, and a secondary lexical system attached to the primary lexical system.

Potter, So, von Eckardt, and Feldman (1984) proposed models of the bilingual lexicon that are similar to Weinreich's descriptions, but capture lexical storage. The word association model assumes separate storage for words in the two languages but a shared conceptual store. In this model, as with Weinreich's subordinate bilingual, only first language (L1) words have direct access to the concepts and therefore second language (L2) words must necessarily be translated into the L1 to access meaning. The concept mediation model, resembling Weinreich's compound bilingual, depicts words from the two languages as being stored in separate lexicons with only one conceptual store. Unlike the word association model, both languages have access to the conceptual store and translation to the L1 is not necessary for L2 access to meaning.

Kroll and Stewart (1994) proposed the revised hierarchical model (RHM), including separate lexicons for each of the bilingual's languages and one shared conceptual store. This developmental model captures language development by proposing an initially larger

L1 lexicon, with the size of the L2 lexicon increasing as new entries are added. Additionally, learners start with the strongest links from the L2 to the L1 and from the L1 to the conceptual store. With increased use of the L2, the L2 links to the concepts strengthen; the bilingual moves from lexical mediation through the L1 to direct conceptual mediation from the L2 lexicon.

These initial proposals describing the bilingual lexicon as two separate lexicons with either a shared or a common semantic system lead to a series of related questions about the nature of the lexicon. What exactly is in the lexicon? Are all aspects of a word in a separate lexicon? Are all meanings shared across languages? Indeed, current research suggests that, at least under some circumstances, the lexical representations may be integrated in one lexicon (e.g., Van Heuven, Dijkstra, & Grainger, 1998) and there may be limits to the degree to which even the semantics are shared across languages (e.g., De Groot, 1993; Pavlenko, 1999). Interested readers should consult Kroll and Sunderman (2003) for a detailed discussion of the RHM, an important developmental model of the lexicon that has received a great deal of empirical support.

Lexical Access in Proficient Bilinguals

Over time, the issue of lexical storage became inextricably linked to the notion of lexical access. In other words, it was difficult to tease apart where a word was stored from how that word was retrieved or accessed. Van Heuven et al. (1998) point out that separate lexicon models tended to be associated with selective access (only retrieving words from one lexicon), whereas integrated models assumed nonselective access (having both lexicons called upon for retrieval). Most of the recent psycholinguistic work supports the view that for proficient bilinguals lexical access is nonselective, with words from both languages activated in parallel (e.g., Van Heuven et al., 1998; Dijkstra, Grainger, & Van Heuven, 1999). The evidence for this view comes from psycholinguistic studies that take advantage of certain cross-language features (such as neighbors; see below) to test the relative activation of the nondominant language. These studies have shown that in comprehension for highly proficient bilinguals, both languages are active and never really “shut off.”

Lexical Neighbors

Van Heuven et al. (1998) examined the influence of orthographic neighborhoods within and across languages. An orthographic neighbor is any word differing by a single letter from the target word, respecting length and letter position (Coltheart, Davelaar, Jonasson, & Besner, 1977). In English, the words *gate*, *date*, and *late* would be orthographic neighbors. For a Spanish–English bilingual, the Spanish words *mate* and *bate* would also be considered neighbors. Van Heuven et al. tested the neighborhood effect by means of a lexical decision task. In lexical decision, a participant is presented with a string of letters and is asked whether that string is a word or not. Past research has shown that monolinguals activate other lexical candidates that have overlap in orthography, phonology, and semantics (e.g. Andrews, 1997; Frost, 1998). Therefore, if monolinguals activate intralingual candidates, then there are two possibilities for bilinguals, depending on lexical access. In terms of the neighborhood effect, the selective models would suggest that recognition of a target word is only affected by the neighbors in the language of the target, and that cross-language neighbors should have no effect. Under this view, an input switch would be set to the specific lexicon and the other lexicon would functionally be shut off. The nonselective models suggest that words from both languages will be activated simultaneously, and therefore these models would predict that neighbors from other languages would be active too. This position predicts effects of cross-language neighbors with no switch set to the

lexicon of the target. Van Heuven et al. (1998) found support for the nonselective alternative; identification of English target words was affected by the presence of both Dutch (L1) and English (L2) neighbors. However, when the bilinguals were identifying Dutch (L1) target words, the amount of interference from the English (L2) was related to their proficiency. The more proficient the bilingual, the more interference the English words caused.

Overall, this experiment (along with others such as Dijkstra et al., 1999, using other types of cross-language features like homographs or cognates) provides strong evidence that in bilingual word recognition, lexical access for proficient bilinguals is nonselective in nature. Interested readers should see Degani and Tokowicz (2010) for a summary of research on both within-language and cross-language effects in lexical processing.

Lexical Access in Language Learners

Many of the studies on lexical access have been conducted with highly proficient bilinguals. Remarkably little research has traced the development of lexical form activation across L2 development. The few studies that have included comparisons of L2 speakers who differ in their L2 proficiency suggest that the pattern of cross-language influence changes with level of skill in L2 (e.g., Bijeljac-Babic, Biardeau, & Grainger, 1997; Talamas, Kroll & Dufour 1999; Sunderman & Kroll 2006). The next sections describe research related to cross-language activation and the underlying nature of the lexical and conceptual links in less proficient bilinguals.

Cross-Language Activation

Jared and Kroll (2001) investigated the development of lexical form activation. Native English speakers named words aloud in English (L1). These English speakers knew French as an L2, but differed in their proficiency. The words used in the experiment were chosen on the basis of the properties of their neighbors in English and in French. In particular, a neighbor was considered to be an enemy if the spelling and sound varied across languages. For example, a French enemy would be an English word like *bait*, which contains *-ait*, pronounced differently when it appears in a French word like *fait*. This experiment aimed to determine the effect, if any, of the presence of French enemies on English speakers naming words in their L1. The dependent measure was the time to begin to articulate the word and the corresponding accuracy. The results showed that for the English naming task without prior L2 activation, only effects from the English enemies were found with no cross-language influence.

However, when the participants performed a block of naming words in French, activating the L2, an effect from the French enemies was found on English naming time, but only for the most proficient L2 speakers. In other words, the most proficient L2 speakers were slower to name the English words with French enemies, once their L2 was active. When the block of French words contained the enemies themselves (i.e., the French words that looked like but did not sound like the English words to be named), inhibitory effects of the French enemies were found for English naming by less skilled L2 speakers. All participants were slower to name French words that looked like English words, even though they were naming in a French block. These results suggest that the system is able to function nonselectively even when both languages are active, but that the degree of language activation due to the proficiency of the learner affects this nonselective mode. In general, there is more of an asymmetry at early stages of L2 acquisition, with stronger effects from L1 to L2 than the reverse.

Van Hell and Dijkstra (2002) examined the influence of foreign-language knowledge on L1 performance. They recruited trilinguals, with Dutch as their dominant and native L1,

English as their L2, and French as their third language. French proficiency level was split, with some participants less proficient and others more proficient in this language. The tasks performed in this study were all completed in Dutch (L1) and the participants were unaware that the study was interested in their other languages. The materials in the tasks were Dutch words that were either cognates with English or cognates with French, or were non-cognates. (Cognates are words in different languages that have the same meaning and similar forms.) Van Hell and Dijkstra showed that, in a lexical decision task, the Dutch–English bilinguals were faster to recognize Dutch words that were cognates with English. Cognates are typically recognized more quickly in a lexical decision task utilizing both languages. In this task the participants had no instruction to use the other language, but all showed effects of their L2, English, thus providing compelling evidence for the non-selective nature of lexical access. Moreover, the participants with higher French proficiency were also faster to recognize cognates with French. However, the participants with lower French proficiency did not show a difference in response times between cognates with French and other cognates, thus suggesting that a minimal amount of proficiency is required in another language before its effect on the L1 is noticeable.

Form Versus Meaning

To investigate the nature of the underlying lexical and conceptual links in the developing lexicon, Talamas et al. (1999) used a translation recognition task performed by English (L1) native speakers of varying levels of Spanish (L2) proficiency. In a translation recognition task a participant is asked to decide whether the second word is the correct translation of the first word (e.g., *man–hombre*). On the critical trials where the participant had to say “no,” the two words were related either by form similarity (e.g., *man–hambre*, where *hambre* means ‘hunger’) or by meaning similarity (e.g., *man–mujer*, where *mujer* means ‘woman’). Talamas et al. (1999) found that the two types of critical trials produced different results depending on the proficiency of the bilinguals. For less proficient bilinguals, there was significant interference for form-related pairs, but little effect for semantically related pairs. For more proficient bilinguals, the pattern was reversed. This result suggested that the translation equivalent was active for beginning bilinguals. Sunderman and Kroll (2006) reported similar findings regarding the activation of the translation equivalent in less proficient bilinguals. However, their data also indicated that cross-language neighbors (i.e., words in Spanish that were similar to the lexical form of the English word, for example *man–mano*, where *mano* means ‘hand’ but looks like ‘man’) were active for both more and less proficient bilinguals.

Ferré, Sánchez-Casas, and Guasch (2006) also investigated this developmental shift from reliance on form to conceptual mediation and reliance on meaning. Spanish–Catalan participants of varying proficiencies and differing ages of acquisition performed a Catalan (L2) to Spanish (L1) translation recognition task manipulating relationships in form and meaning, with this relationship in meaning further manipulated as very close and close. Along with form and meaning, both proficiency and age of acquisition, a potential factor in the availability of semantic information for less proficient learners, were manipulated. Overall, the participants included 105 Spanish–Catalan bilinguals divided into an early bilingual group, a late proficient bilingual group, and a late nonproficient bilingual group, all of whom acquired Catalan in an immersion context. The results revealed that all participants were slower and less accurate on items related in form, suggesting that lexical form is active at all levels in all tested contexts. With respect to meaning, only the early proficient bilinguals were slower with semantically related items, but all groups were less accurate, to some degree, on such items. Additionally, both early and late proficient bilinguals experienced more interference from the very closely related semantic pairs than for the pairs related in form, suggesting that for these learners, meaning is more active than form.

With respect to lexical access, the research suggests that for all learners, aspects of form and meaning affect processing. Although more proficient bilinguals are better able to access meaning from their L2, even less proficient bilinguals experience semantic interference to some degree. However, context may affect this access, with activation of the L2 depending on prior use and level of proficiency. Importantly, once the L2 has been activated and whether the learner is aware of this activation or not, words from both languages are available and affect processing. It seems that even considering proficiency level and L2 activation, the nonselective viewpoint best captures lexical access in both proficient and developing bilinguals.

Given that previous research suggests that all languages are active to a certain extent and that aspects of both form and meaning affect processing, researchers are now seeking to determine how a bilingual resolves this competition. Is it possible that the bilingual has a mechanism that provides control over lexical access? According to Green's (1998) inhibitory control (IC) model, all words contain language tags specifying to which language they belong. During lexical access, the inhibitory control mechanism is able to suppress those words by virtue of their nontarget language tag, thereby allowing words in the target language to be selected and ultimately produced. Thus, researchers have begun investigating issues of inhibitory control and the potential factors that may affect its use and selection of one of a bilingual's languages.

Conclusion

A psycholinguistic approach to vocabulary examines how individuals store and access words in their mental dictionary and what factors may affect this process. While nonselective access is supported by the research, context, proficiency and prior usage may affect this activation. Currently, research is investigating how the bilingual manages this competition from their two languages and is able to perform a task in a target language. The findings from these studies will provide us with a more complete picture of the psycholinguistic processes related to vocabulary.

Psycholinguistic Studies of Literacy

ANNIE PESHKAM AND DAVID N. RAPP

Literacy can be defined as the sets of skills or abilities that operate in the service of comprehension for information we read or hear or see. This includes moment-by-moment understanding of that information, as well as the potential application of any knowledge acquired from that information in future settings. Studies of literacy have often focused on the types of activities that are necessary to ensure successful reading experiences. These have included case studies of classroom behavior, investigations of teacher practices, analyses of the processes that underlie visual encoding of letter stimuli, and interventions designed to remediate struggling readers' difficulties (to name a few areas of interest). In line with the simple view of reading, as offered by Gough and Tunmer (1986) and Hoover and Gough (1990), many of these projects have focused on two core sets of reading activities—basic-level processes that underlie the types of pattern recognition activities necessary to decode and identify words and sounds, and higher-order processes that are necessary to extract meaning from words and sentences. Additionally, these projects might be broadly categorized as investigating two aspects of reading experiences: (a) the study of the *learning products* that result from reading, as measured by tests of reader comprehension and memory *after reading is completed*; and (b) investigations of the internal *mental processes* that individuals engage in *as they read a text*.

Psycholinguistics is the psychological study of language production and comprehension, for instance involving reading, speech, and even gesture. In this entry we will focus on reading comprehension. These topics are studied using empirical methods, including experimental methodologies designed to measure the processes and products of language use. Therefore, much of the research conducted by psycholinguists connects nicely with work conducted by researchers who are studying literacy in other fields. For example, psycholinguists might study how phonological features are activated when individuals read words, how syntactic ambiguities are dealt with during language processing, or the type of inferences that are more or less likely to be constructed for expository text materials (again, to name but a few projects). The benefits of employing a psycholinguistic approach, as with using any particular approach to the study of language, come from the applicability of its methodological toolkit for addressing specific questions about the processes and products of comprehension. The resulting research hypotheses, frameworks, and models have proven beneficial for investigating the type of issues that have been of interest to literacy researchers—again, the basic and higher activities that underlie language experience.

In general, psycholinguistic studies of literacy have focused on readers' attempts at recognizing various parts of language, separating and interpreting meanings, and constructing an integrated understanding across language units (e.g., words, sentences, and paragraphs). However, any examination of literacy that focuses solely on comprehension without consideration of the overall reader experience neglects the importance of broader factors that directly influence literacy. Many individuals' attempts to read are guided by instructions they receive before encountering a text, or goals they establish for using those materials later. Thus, psycholinguistic accounts, in line with more general approaches to literacy, have also attempted to think more broadly about the factors that might influence

comprehension successes and failures. The goals, of course, are not only to uncover how individuals build meaning during reading but also to examine the influential factors that contribute to our everyday reading experiences, both of which are integral to building a more informed understanding of literacy.

In this entry, we will provide a brief review of several important features of everyday reading experiences that influence comprehension. We will specifically focus on higher-order processes and their contributions to literacy, as that is the approach we have taken in our own psycholinguistic research. First, we consider how the goals that readers bring to the reading experience, established through instructions, reader predilections, or motivated by elements of the text, influence comprehension. Second, we outline how readers derive meaning from the text during moment-by-moment reading. Here we will focus on the fundamental role of inferential processes as they have proven particularly influential in psycholinguistic accounts of literacy. Third, we provide a description of what readers' final representations of texts might look like after reading; in essence, what they have encoded into memory (and hopefully can retrieve as necessary). We have organized the entry into these sections in an effort to provide an introduction to psycholinguistic investigations of literacy, and to emphasize aspects of the reading experience that have implications for both theoretical understandings of reading, as well as practical applications in the design of literacy experiences and interventions.

Prereading Activities

Investigations of reading comprehension often focus on the types of prereading activities that can influence readers' experiences with a text. One of the goals of this area of research has been to outline some of the potential factors that can influence processes (i.e., the activities that occur during moment-by-moment reading) and products (i.e., what readers remember from the text) of comprehension. For example, individuals might be explicitly directed to read a text in a particular way, hold prior expectations about the materials they are about to read, or make decisions about approaching the text with specific goals. Instructions to attend to specific segments in a text might encourage reader focus on, and better memory of, those concepts than if instructions were not provided. Readers might also have very different expectations about the information they encounter, depending on a text's content or their own *a priori* beliefs, that can lead to genre-related differences in processing and retrieval from memory. Holding particular goals prior to reading, for example when reading for entertainment versus reading in preparation for an exam, might influence the effort that readers apply to material, and their resulting understandings. Examinations of prereading activities help reveal that reading experiences are guided, in part, by factors that play a role even before the reading experience begins. We provide a brief psycholinguistic review of how some of these prereading activities play an integral role in comprehending text.

Explicit instructions to approach or complete a task demand constitute one particular type of prereading activity. Specifically, a subset of research has looked at the influence of prereading questions on reading times (i.e., the time it takes to read a word or sentence) and recall of particular text segments. For example, prereading questions have been examined as to whether they help draw readers' attention to specific segments of an expository text (e.g., McCrudden, Schraw, & Kambe, 2005). Before reading, one group of participants might be asked to read a text while focusing on particular questions that target specific text segments, while another group is simply asked to read the text and remember as much as possible. Results from such studies indicate that guided instruction leads to improved recall for targeted text segments without a concomitant increase in reading times for those segments. This is one example of a prereading activity that affects reading by influencing

how individuals approach the text. The results suggest that instructions to focus attention on particular concepts or ideas can encourage the construction of memory traces for relevant materials. This type of finding empirically supports literacy practices that instructors often use spontaneously in their classrooms (i.e., asking students to focus on particular elements of their readings).

Readers' implicit expectations about text genres also exert an influence on comprehension activity. For example, consider the different ways readers might process expository versus narrative texts. Expository texts, which include textbooks, encyclopedias, or news articles, provide explanations that describe facts or principles. Narratives, which include fictional stories, describe event sequences that often follow a well-defined causal structure and typically involve one or more characters attempting to overcome obstacles to pursue a goal. The features associated with these genres are so familiar that a reader may hold specific expectations that influence how they process and remember texts (Wolfe, 2005). For example, in one study examining narratives, two different groups of readers read the same set of text excerpts (Zwaan, 1994); one group was told the excerpts were taken from European novels (i.e., literary condition), while the other group was told the excerpts were taken from major newspapers (i.e., news condition). Participants in the literary condition read the text more slowly and remembered more of the exact wording of the text than participants in the news condition. Presumably this was a function of readers' expectations that comprehension of literary texts relies more on remembering the exact words that were read, as compared to the gist-like memory that might be associated with reading and thinking about news articles. This type of evidence indicates that readers' literacy activities involve genre-specific beliefs about the way a text will unfold that can significantly impact processing of, and memory for, texts.

Of course, another way of looking at the influence of prereading activities would be to consider the explicit goals that readers might establish for themselves even before they approach a text. These goals also guide reading behaviors. For example, reading for a particular purpose specifically influences the types of information that readers attend to and remember later. In one relevant study, participants were provided with a text passage and either asked to imagine browsing through a magazine with the information (i.e., entertainment condition) or to imagine they were studying the text for an examination (i.e., study condition) (van den Broek, Lorch, Linderholm, & Gustafson, 2001). Participants read each sentence out loud and were asked to state any thoughts that came to mind. After reading they were asked to recall as much of the text as possible from memory. Participants in the entertainment condition made looser associations between text elements while thinking out loud and recalled a smaller proportion of informational content from memory than participants in the study condition. This shows that having a particular purpose for reading a text can influence the type of coherence-building processes (i.e., making associations between text elements) that occur during and after reading. The findings provide evidence that readers might have very different literacy experiences depending on the stance they take when they approach a text; that stance might be influenced by the intentions evoked by the text, the intentions that readers bring with them to the text, and interactions between the two.

The psycholinguistic studies we have described here reveal that prereading experiences prove crucial to understanding our everyday literacy activities. Some researchers have argued that our understanding of these prereading activities can have important implications for the development of curricula or reading interventions. For example, the degree to which a student is provided with focusing instructions during reading might impact the likelihood of engaging in processes of conceptual change (see Guzzetti, Snyder, Glass, & Gamas, 1993, for more detail on this issue). Thus, these investigations have both basic and applied value.

During Reading

To introduce psycholinguistic research that has examined reader activity *during* reading, we focus here on describing a particular mental process that is integral for comprehension—inference construction. Inference construction involves deriving information that goes beyond the content of a text. Readers generate inferences to fill in missing information, resolve discrepancies, or predict unmentioned events or facts, doing so by relying on relevant background knowledge or previous text content. For example, in order to comprehend the sentences “John walked into the garden and turned on the lawn mower. He later threw the grass into the dumpster” the reader might fill in the following missing information: a lawn mower is a machine used to cut grass, John cut the grass with the lawn mower, and after one cuts grass, the cuttings can be gathered and thrown away. This particular set of inferences might be used to bridge the two explicitly presented statements. In this section, we will describe some psycholinguistic studies that examine the inferences that individuals generate as they attempt to comprehend what they read. We note that inferences are considered by some a hallmark of skilled reading, and therefore understanding the role and consequences of inference construction can inform both basic and applied research on literacy activity.

Often, readers must establish connections between explicit text ideas by constructing inferences that connect one sentence with the next. For example, consider the following sentence pair (1): “Dorothy poured the bucket of water on the bonfire. The bonfire went out” (Singer, Halldorson, Lear, & Andrusiak, 1992). To understand the relationship between these two sentences, readers must construct the bridging inference that “water extinguishes fire.” Studies testing bridging inferences often present individuals with these types of sentence pairs, or with pairs that do not necessarily afford the direct construction of bridging inferences, such as with (2): “Dorothy placed the bucket of water by the bonfire. The bonfire went out.” If participants are asked to answer the question “Does water extinguish fire?” following these types of sentence pairs, they are much faster to answer yes to this question following the first pair than to the second pair. This is expected because the bridging inference is necessary in pair one (i.e., water was poured onto the fire and caused it to be extinguished), and thus active, by contrast with pair two (i.e., the water was only next to the fire that somehow went out). Bridging inferences are considered an essential activity for comprehension, as texts often leave out information that readers infer to “fill in the gaps.”

Besides bridging inferences, readers are also capable of anticipating upcoming information by constructing predictive inferences. Studies seem to suggest that readers construct predictive inferences during moment-by-moment reading under specific circumstances. If participants are presented with statements that indicate a likely outcome (e.g., “The director and the cameraman were ready to shoot closeups when suddenly the actress fell from the 14th story”), they reveal activation of predictive-relevant information (e.g., the concept “dead”), compared to sentences that suggest no such outcome (e.g., “Suddenly the director fell upon the cameraman, demanding closeups of the actress on the 14th story”) (McKoon & Ratcliff, 1986). Constructing predictive inferences can be a useful literacy activity, particularly in considering how texts might unfold given the previous material and readers’ prior knowledge; in fact, teachers often ask students to hypothesize about upcoming events for both narrative and expository materials. Thus, understanding the circumstances under which readers might or might not construct predictive inferences can prove important for investigations of literacy skills.

Bridging and predictive inferences are classes of inferences that can be generated across many types of texts. However, more specific inferences also occur as a function of particular text features. For example, readers can infer characters’ traits (e.g., Rapp, Gerrig,

& Prentice, 2001), emotions (e.g., Gernsbacher, Goldsmith, & Robertson, 1992), and intentions (e.g., Graesser, Singer, & Trabasso, 1994) when they read narratives. In addition, readers also keep track of various dimensions including space and time, in attempts to understand how events unfold and relate in texts (e.g., Zwaan & Radvansky, 1998; Rapp & Taylor, 2004). There is a rich and continually growing database of investigations that study the types of inferences readers might construct as they engage with texts (e.g., Graesser, Singer, & Trabasso, 1994).

It is generally agreed that inferences are crucial for building a coherent representation of the text. Nevertheless, there has been considerable debate concerning whether inferences are constructed as a matter of course, or whether readers construct them only under precise circumstances. Additionally, researchers have argued as to whether inferences might be constructed automatically, as a function of passive retrieval from memory, or whether inferences necessarily require strategic decisions about the activation of information from prior knowledge and the current text (readers interested in these topics are directed to reviews on the debate, including McKoon & Ratcliff, 1992; van den Broek, 1994; Zwaan & Rapp, 2006). While a full discussion of these issues is beyond the scope of this entry, current views contend that a comprehensive model of comprehension will need to consider how all of these types of processes might contribute to readers' literacy activities (e.g., Rapp & van den Broek, 2005).

In this section, we have discussed how readers' literacy activities are dependent upon inference processes that occur during comprehension. These studies focus on uncovering what happens during reading, as readers attempt to make sense of texts by making connections between text elements as well as between texts and prior knowledge. Inferences are at the foundation of literacy practice; they prove important in the design of interventions intended to help students not just identify the words in a text, but understand what a text is about.

After Reading

One of the goals of most literacy experiences is to acquire information that can be used later. Simply put, what we read or hear should be encoded in memory in such a way that it can be used to think about the world. During memory retrieval, individuals attempt to access their stored knowledge, and use that information to solve problems, make decisions, and so forth. In this section, we draw attention to some psycholinguistic investigations that have uncovered the nature of readers' memory and how memory processes are influenced as a function of text content.

A large body of research has shown that experiences with discourse can potentially lead to different levels or types of representations in memory. Readers can hold *surface-level* (i.e., memory for exact words read), *propositional-level* (i.e., the gist meaning that underlies sentences), and *situational-level* (i.e., information conveyed by the text but not necessarily limited to it) representations. Typically, the surface structure is retained only briefly, and what remains is the gist (Mani & Johnson-Laird, 1982). Additionally, situational representations might be formed if readers generate inferences to go beyond the ideas conveyed within the text. Tests to determine the types of memory representations readers might hold often evaluate the successes or confusions that accrue after reading texts. For instance, after being presented with either sentence (1) "Three turtles rested *beside* a floating log, and a fish swam beneath *them*" or (2) "Three turtles rested *on* a floating log, and a fish swam beneath *them*," participants might be tested with a recognition sentence that changes only the final pronoun, (3) "Three turtles rested on a floating log and a fish swam beneath *it*," and asked to indicate whether they had experienced this sentence before (Bransford,

Barclay, & Franks, 1972). Findings indicate that participants originally presented with sentence (2) were more likely to falsely report having previously seen sentence (3) than participants who were originally presented with sentence (1). Note that both sentences (2) and (3) describe a similar situation (i.e., a fish swimming beneath turtles and a log), while sentence (1) differs in terms of the described situation (i.e., a fish is swimming beneath turtles but not the log). Readers' confusion as to having seen sentences with similar situations suggests little in the way of an accurate surface representation, but rather a more gist-like and situational representation for the underlying meaning of the discourse.

While readers are more likely to retain memory for meaning rather than surface form, the content of a text can also influence what is likely to be remembered. For instance, the content of what we read is often connected by causal links. Information in the text that is linked causally to more information is better remembered than information with fewer causal connections (e.g., van den Broek, 1994). When participants are asked to read pairs of statements that vary in their causal strength, pairs with stronger causal relations (e.g., "Joey's big brother punched him again and again. The next day his body was covered with bruises") tend to be recalled better than pairs with weak causal relations (e.g., "Joey went to a neighbor's house to play. The next day his body was covered with bruises") (Keenan, Baillet, & Brown, 1984). Additionally, when the causal connections are more obvious or easier to infer, readers remember the events from those sentences better than when the connections are less obvious or difficult to infer directly. Thus, the content of the text can impact the degree to which a reader builds memory for text descriptions and can later retrieve that information from memory.

While successful retrieval is the optimal scenario for any literacy experience, readers often fall prey to memory failures. These types of failures can include situations in which information fails to be accurately recalled or, just as problematically, situations in which readers rely on inaccurate information that they have encoded into memory. This latter condition can be particularly problematic when readers encounter incorrect information in texts. To demonstrate the scope of this problem, studies have presented readers with stories containing inaccurate statements (e.g., "The capital of Kentucky is Louisville") for which the correct fact ("The capital of Kentucky is Frankfort") is well known according to norming data (Marsh, Meade, & Roediger, 2003). Following their readings of these texts, participants are provided with trivia quizzes, for which some of the questions are related to the statements provided in the texts (e.g., "What is the capital of Kentucky?"). Unfortunately, despite the fact that participants *should* know the answers to these questions, they often end up relying on the misinformation provided in the texts. That is, their reading of these stories often leads them to encode and rely on incorrect information, even when they should know better. What these kinds of findings indicate is that literacy experiences can often result in individuals learning about the world, but at times, what they learn might be inaccurate. Current projects attempt to discern exactly when readers will rely on what they read, and when they will ignore that information (Rapp, 2008). Understanding the contexts in which readers will update what they know, be it accurate or inaccurate, proves crucial to a complete understanding of literacy experiences.

Conclusions

In this entry, we have attempted to provide a brief review of psycholinguistic projects that are directly related to the study of literacy. The projects we have considered have focused specifically on higher-order comprehension processes; this includes the ways in which readers approach texts, the types of inferences and understandings they generate as they read, and the degree to which texts lead to the construction of memory for what has been

read. The research projects described here have been helpful in informing a basic understanding of the processes that underlie comprehension and the products that result from attempts to comprehend. In addition, these findings are now being utilized in the development of interventions that are intended to teach successful literacy skills, including inference construction and critical reading strategies (see Rapp, van den Broek, McMaster, Kendeou, & Espin, 2007, for an example of this work). In the future, we hope to see more connections between lab-based psycholinguistic investigations of language processing, and applied investigations of literacy in learning settings, with the goal of promoting effective discourse experiences.

Pullum, Geoffrey K.

JOHN PAYNE

Geoffrey K. Pullum (1945–) is a general linguist specializing in the study of the English language. He has published over 250 works on a wide variety of topics in theoretical and applied linguistics.

He was born in Irvine, Scotland, and grew up in West Wickham, Kent. His secondary schooling was at Eltham College in southeast London. He left school early and worked in the popular music industry from 1963 to 1967. At that time he married Joan Rainford (born in Kingston, Jamaica), and resumed his education. He entered the University of York as an undergraduate in 1968, to study in the Department of Language founded by Professor Robert B. Le Page, and spent 1969–70 at a center for further education in Southall, Middlesex, studying the teaching of English to Punjabi-speaking immigrants. His BA in language (first class honors) was awarded in 1972, and his son Calvin James Pullum was born the same year.

He spent 1972–3 working as a teaching fellow at York, and 1973–4 as a research student at King's College, Cambridge. In the summer of 1974 he attended the Linguistic Institute at the University of Massachusetts at Amherst, and in September he took up a position as lecturer in linguistics at University College London. He was awarded the PhD in general linguistics by the University of London in 1976. He spent 1980–1 in visiting positions at the University of Washington and at Stanford University, and in 1981 accepted an appointment as associate professor of linguistics at the University of California, Santa Cruz. There he was promoted to professor in 1983; he served as dean of graduate studies and research from 1987 to 1993; and he was named distinguished professor of humanities in 2004.

Theoretical work has predominated in Pullum's research and teaching career. From the 1970s to the 1990s, he contributed many ideas which have remained influential to this day. These include the analysis of English auxiliaries (Pullum & Wilson, 1977) and criteria for distinguishing affixes and clitics (Zwicky & Pullum, 1983). In the 1980s he developed an interest in computational linguistics, working for several years as a consultant at Hewlett-Packard Laboratories advising a project on linguistic engineering and natural language processing. This work was associated indirectly with parallel work on the development of a computationally tractable theoretical framework for syntax, and led to the publication of the book *Generalized Phrase Structure Grammar* (Gazdar, Klein, Pullum, & Sag, 1985). During this time he also edited, with Pauline Jacobson, an important collection *The Nature of Syntactic Representation* (Jacobson & Pullum, 1982), and, with Desmond Derbyshire, the four volumes of the *Handbook of Amazonian Languages* (Derbyshire & Pullum, 1986, 1990, 1991, 1998). In 1986, with a second edition in 1996, he produced with William Ladusaw the *Phonetic Symbol Guide*, a practical guide to identifying phonetic symbols in the various linguistic literatures (Pullum & Ladusaw, 1996).

In the second half of the 1990s and early 2000s, Pullum collaborated on *The Cambridge Grammar of the English Language* (Huddleston & Pullum, 2002), a multiauthored book of which he and Rodney Huddleston were the lead authors. Intended for advanced researchers in fields such as English language course design rather than just linguists, the book won the Leonard Bloomfield Book Award in 2004, and was followed by a textbook, *A Student's Introduction to English Grammar* (Huddleston & Pullum, 2005). It is probably Pullum's best known work in applied fields. More recently, his theoretical work has returned to concerns

with expressive power and the mathematical foundations of grammatical theory. This includes an analysis (Pullum & Scholz, 2010) of the flaws in generative linguistic argumentation for the claim that natural languages have infinitely many sentences.

However, in addition to his contribution to English grammar and theoretical linguistics generally, Pullum has always done applied work as well. His earliest publications were on applied topics, for example, work on the names of Indian and Pakistani immigrants (Pullum, 1970), and on Indian scripts and English language teaching (Pullum, 1971). He has returned to various applied topics in more recent years, most notably to a critique of nativist approaches to language acquisition, for example, arguments based on poverty of the stimulus (Pullum & Scholz, 2002).

The “Ebonics” brouhaha of 1996, when the Oakland Unified School District in northern California was mercilessly mocked in the press for an announcement about classroom recognition of African American vernacular English (AAVE), led Pullum to write a commentary on the controversy in *Nature* under the title “Language That Dare not Speak its Name” (Pullum, 1997). He later wrote “African American Vernacular English is not Standard English with Mistakes” (Pullum, 1999), a longer treatment of some of the properties of AAVE.

“Lexical Categorization in English Dictionaries and Traditional Grammars” (Pullum, 2009) is about getting the categories of words right in dictionary entries. “The Truth About English Grammar: Rarely Pure and Never Simple” (Pullum, 2010a) concerns issues in language proficiency testing. And “Prescriptive Grammar in America: The Land of the Free and *The Elements of Style*” (Pullum, 2010b) discusses the failings of the most popular prescriptive work on usage in the United States of America.

In addition to his scholarly writing, Pullum has always done occasional journalistic and popular writing about language too. His collection of satirical essays on linguists and linguistics, *The Great Eskimo Vocabulary Hoax*, was published in 1991, and a book of posts from the popular Language Log website (joint with Mark Y. Liberman) was published as *Far From the Madding Gerund* (Liberman & Pullum, 2006).

In 1994 Pullum married a philosopher of linguistics, Barbara Scholz, with whom he collaborated on a number of works, including Pullum and Scholz (2002, 2010). He moved to the University of Edinburgh in 2007 to become professor of general linguistics, and was elected a fellow of the British Academy in 2009. He sadly lost his wife Barbara Scholz to inoperable cancer in May 2011.

Qualitative Corpus Analysis

VICTORIA HASKO

Definition and Philosophy

Qualitative corpus analysis is a methodology for pursuing in-depth investigations of linguistic phenomena, as grounded in the context of authentic, communicative situations that are digitally stored as language corpora and made available for access, retrieval, and analysis via computer. Researchers using qualitative corpus analysis as the methodological basis for their investigations adopt an exploratory, inductive approach to empirically based study of how the meanings and functions of linguistic forms found in the corpus interact with diverse ecological characteristics of language used for communication (speaker age, gender, level of education, and socioeconomic background; place and time of a communicative event; relationship between interlocutors; speech modality; etc.). A common belief shared by all corpus linguists is that it is important to base linguistic investigations on “real data,” that is, actual instances of oral or written communication as opposed to contrived or “made-up” data. Unique goals of qualitative corpus analysis include facilitating computer-aided retrieval of authentic examples of the language phenomena under investigation, interpreting these empirical data in depth, and applying the ensuing insights to a broad range of intellectual explorations in language studies. This entry summarizes the evolution of the field, outlines the methodological foundations and principles of qualitative corpus analysis, and enumerates major areas of application of the methodology.

Evolution of Qualitative and Quantitative Approaches to Corpus Analysis

Although today we tend to associate all branches of corpus linguistics with a machine-readable format, language corpora were assembled and analyzed B.C. (before computers) by numerous language luminaries, such as Samuel Johnson, Alexander J. Ellis, Joseph Wright, James Murray, Harold Orton, and Sir Randolph Quirk, with application to grammatical, lexicographical, and dialectological endeavors (see Francis, 1992, for details). Thus, when working on entries for his *Dictionary of the English Language*, published in 1755, Samuel Johnson collected a large, handwritten corpus of illustrative literary, philosophical, and scientific examples (ca. 150,000 for ca. 40,000 entries) with the goal of capturing and recording the contextual riches of the collected texts in addition to their linguistic significance. Later, field and structural linguists, such as Franz Boas, Edward Sapir, Leonard Bloomfield, and Kenneth Lee Pike, adhered to the principle of basing studies on samples of attested observable data (McEnery, Xiao, & Tono, 2006). Although early “corpora” consisted of slips of paper, the work of the scholars collecting them was conducted in what we can identify today as the spirit and philosophy of qualitative corpus analysis.

The emergence and firm establishment of corpus linguistics as a methodology, in its modern, computer-based form, are associated with the groundbreaking efforts of W. Nelson Francis and Henry Kučera in developing the Brown Corpus of English in the 1960s. Their compilation of a 1-million-word corpus (an impressive size at the time of its first release

2 QUALITATIVE CORPUS ANALYSIS

in 1964) paved the way for quantitative corpus research but also undeniably created the foundation for methods underlying the modern approach to qualitative corpus analysis. Thus, the Brown Corpus was not compiled as a bank of unconnected words or sentences but rather was designed to include 2,000-word samples of meaningful, cohesive discourse, which were chosen on the basis of their representation of a wide range of diverse styles and varieties of prose. Although primarily syntactic, the tagging system taxonomy applied to the corpus was a step forward from raw corpora in that it illustrated the possibilities of carrying out more refined linguistic and metalinguistic analyses through corpus encoding. In terms of corpus retrieval options, the Brown Corpus employed a variable-length record format, allowing researchers to use word + context as criteria to retrieve not only isolated word forms but also full-sentence citations. These characteristics reflect the most basic utility requirements for a properly compiled corpus suitable for qualitative analysis.

Since the 1980s, the field of corpus linguistics has been dominated by quantitative approaches fueled by the development and propagation of super-corpora, such as the British National Corpus (BNC; 100 million words), the Collins Birmingham University International Language Database (COBUILD; 525 million words and growing), and the Cambridge International Corpus (CIC; 900 million words). At the same time, smaller, parallel, second-wave corpora have been springing up in the form of specialized databases designed by qualitative corpus linguists for meticulous, in-depth exploration of select linguistic phenomena or language varieties. Such corpora range from published collections of 1 million to 3 million words (Helsinki Corpus of Historical English; Michigan Corpus of Academic Spoken English [MICASE]; International Corpus of Learner English [ICLE]) to smaller and highly specialized corpora, such as the Manuscript-Based Diachronic Corpus of Scottish Correspondence or the Corpus of Written Creole (see Beal, Corrigan, & Moisl, 2007a, 2007b). A review of most recent qualitative research studies reveals a growing trend of conducting in-depth analyses on small, scrupulously collected samples of language in a specific context, which enable researchers to concentrate on the fine details of linguistic interaction and then to relate these details to the specifics of the speech event and to the larger community of which they are a part (Waugh, Fonseca-Greber, Vickers, & Eröz, 2007). The prospects for conducting thorough and multifaceted qualitative corpus investigations are looking even brighter with the emergence of multimodal corpora which allow for automatic analysis of not only speech but also such communication modalities as hand gesture, facial expression, body posture, and so forth (Kipp, Martin, Paggio, & Heylen, 2009).

Methodological Foundations

Qualitative corpus analysis is dually informed by the tradition of qualitative linguistic research as well as by research methods specific to corpus linguistics. The methods and principles for conducting qualitative corpus analysis are summarized below.

Corpus Design

A corpus suitable for fine-grained linguistic analysis should consist of complete, naturally occurring texts (oral or written) whose origins and provenance are well documented (see Sinclair, 1996). The requirement for naturally occurring speech acknowledges the importance of analyzing actual, authentic, and attested data, as opposed to invented examples. The focus on complete texts and the importance of social and communicative context in analyzing language is central to qualitative corpus analysis and the qualitative research paradigm in general, as “the context plays a part in determining what we say; and what we say plays a part in determining the context” (Halliday, 1978, p. 3). Therefore, it is expected that texts are carefully selected to offer a satisfactory representation of

modalities, genres, discourse communities, settings, or other language varieties, or all of these, that the corpus is designed to reflect.

Corpus Markup and Annotation

Corpus markup represents an important method of documenting the aforementioned descriptive “metadata” pertaining to the collected linguistic samples. Corpus markup is carried out by inserting standardized codes or tags in each of the documents of a raw corpus, with the codes kept separate from the corpus data per se. A number of markup schemes have been developed for encoding such specifications as document-wide information (document length, distributor, date, etc.), structural elements (e.g., chapter, titles, headings), and subparagraph structure (e.g., quotations, abbreviations, terms).

Annotation is a corpus-encoding method similar to markup, except that the former involves the encoding of linguistic information (for in-depth discussion of corpus annotation, see Garside, Leech, & McEnery, 1997). Corpus annotation can be characterized by varying degrees of specificity and may address different areas of linguistic analysis, such as part-of-speech tagging (the most common type); lemmatization; parsing; morphological, phonetic, prosodic, pragmatic, semantic, discourse, and metaphorical annotation; and error tagging. The latter types of annotation and error tagging are more commonly associated with qualitative corpus analysis research, because of the complex manifestations of the linguistic phenomena they cover. For example, differences between teasing and verbal dueling, discursive construction of hip-hop identity, or comparisons of television dialogue with natural conversation strategies (Partington, 2006; Ådel & Reppen, 2008) are contextualized phenomena not immediately observable on the surface or available for automatic retrieval from raw texts, because their linguistic instantiations are realized across morphemes or even thousands of words of running text. Various part-of-speech taggers are available for automatic annotation of large quantities of data, but when the encoding of finer linguistic categories characteristic of qualitative analysis requires a greater capacity for subtle judgment and the drawing of inferences, which are often cornerstones of rich and thorough qualitative investigations, manual annotation must be implemented by a human encoder. Accuracy and consistency are crucial factors for ensuring the reliability of the largely interpretive process of corpus annotation. Such solutions as development of a coding manual as a reference, thorough descriptions of the codes, instructions for applying these codes, and flowchart-style decision algorithm trees to assist coders are being utilized to minimize any arbitrary and individual variation in the manual annotation of complex phenomena.

Data Retrieval

The drudgery of painstaking corpus markup and annotation during qualitative corpus analysis starts paying off at the stage of data retrieval. The more complex the nature of the analyzed phenomena, the more corpus utility depends on the proper compilation and annotation of the corpus prior to carrying out the query; for this reason, corpora compiled for qualitative corpus analysis are typically conceptualized and designed with fairly specific research goals in mind. Various retrieval software applications are available for processing corpora, that is, for searching through it for particular words or surface structure, for displaying parts of it, or for analyzing specific linguistic features (e.g., WordSmith Tools, Mono Conc Pro, and XAIRA). While such programs can operate on plain text files, they take full advantage of annotated corpora, allowing for retrieval of all instances of surface structures containing the target tag(s) in the sampled corpus within a few seconds. Data searches can be as sophisticated as the annotation scheme applied to the corpus data.

4 QUALITATIVE CORPUS ANALYSIS

The capabilities for automatic data retrieval during qualitative corpus analysis enable the scholarly community to replicate searches, with the purpose of reproducing and verifying outcomes of linguistic investigations, when corpora are publicly available and corpus markup, annotation, and problem-oriented tagging schemes are made available along with the published corpus. This is a significant benefit for a qualitative methodology, as qualitative approaches are often criticized for the difficulty of scientific reproduction and verification of their analyses.

Data Interpretation

Qualitative corpus analysis is a relatively new research enterprise with unique methods; yet at the same time, it draws on a variety of previously established methods of linguistic enquiry. Text selection, corpus size, markup, and annotation schemes are typically predetermined in qualitative corpus analysis before corpus compilation and are informed by such qualitative methodologies as narrative inquiry, genre studies, (critical) discourse and conversation analysis, ethnography of communication, contrastive analysis, and semantic and pragmatic analysis. The methodological merger between qualitative corpus analysis and “traditional” qualitatively oriented approaches is organic, in that they are oriented toward “telling the story” by accounting for the richness of the contextual factors that situate quantitative findings in the ecology of human communication. The merger is also mutually beneficial. On the one hand, without the insights accumulated by qualitative linguistic methodologies from various interdisciplinary areas over the last century, corpus methodology alone would lack the sophistication of the methodological apparatus, as well as the subject matter base for describing and interpreting the complex nature of human communication. For these reasons, in qualitative corpus research, corpus evidence is often supplemented with further experimental data (interviews, self-reports, elicitation, etc.), introspection, and inventions (see Chafe’s principles, 1992). On the other hand, non-corpus-based qualitative approaches are typically constrained by rather limited size of text and a painstaking approach of accounting for each individual example of analyzed phenomena every time data analysis is conducted, whereas qualitative corpus analysis methodology creates affordances for (collaborative) compilation of larger data sets; computer-aided storage, annotation, and automatic retrieval; and replication and sharing of empirical evidence.

Although qualitative corpus analysis is often construed as *not* being concerned with frequencies and statistical classification of linguistic features identified in the data, the value of mixing qualitative and quantitative approaches to corpus research is uncontested. Rich insights that stem from qualitative corpus analysis can serve as a precursor for quantitative approaches, allowing for quantification and classification of the linguistic forms, that is, for generalizing the findings of the qualitative analysis of a sample corpus to a larger population (Schmied, 1993). Or, vice versa, the results of quantitative corpus analysis can be explicated and illustrated through the interpretive power of qualitative methodology beyond the bare statistics of occurrence. In practice, qualitative corpus analysis is almost invariably used alongside quantitative approaches.

Practical Applications

A number of subfields of linguistics have benefited significantly from the application of insights and findings that stemmed from qualitative corpus analysis investigations. Corpora designed and executed in accordance with the aforementioned principles of qualitative corpus analysis methodology have had a major impact in the areas of sociolinguistics, discourse, pragmatics, semantics, and forensic linguistics. The field of lexical studies is

a particularly robust example: Modern dictionaries are able to offer significantly more precise, comprehensive, and up-to-date lexical entries because lexicographers have gained access to vast yet methodically annotated corpora, which enables them to tease apart and illustrate usage differences attributed to the wealth of contextual and interpersonal variables. Similarly, grammarians routinely rely on corpora both to verify probabilities of occurrence of grammatical elements in quantitative terms and to qualitatively hone, illustrate, and fine-tune grammarians' claims. Today, major publishing houses support corpus development and the publication of corpus-based dictionaries, grammars, and reference books (e.g., see COBUILD's extensive catalogue of text-based and electronic dictionaries and reference materials).

Qualitative corpus analysis has revolutionized the field of language education by providing an empirical basis for intuitions about what authentic interactions look like and which language structures, strategies, and patterns should be highlighted in language courses and analyzed for effective pedagogical treatment (O'Keeffe, McCarthy, & Carter, 2007). Corpora comprised of cross-sectional and longitudinal samples of learner speech have allowed second language (L2) language researchers to investigate the dynamics of L2 development at different proficiency levels and with regard to such variables as distance and transfer effects between first language (L1) and L2, instructional context, and age of acquisition; accomplishments in this area are exemplified in the prolific work of Sylviane Granger and her associates (2002 and elsewhere).

Conclusions

Qualitative corpus analysis is a methodology that has made a significant contribution to language studies by enabling researchers to access, highlight, and methodically explore attested linguistic phenomena that range from frequent to rare, simple to complex, and easily discernible to stretched over thousands of words. Fueled by technological innovation, informed by the breadth of multimethod approaches, and built upon the successes of various subfields of linguistic research, qualitative corpus analysis offers a unique and promising path to the continued discovery of the complexities of human communication, with richness, precision, and appreciation for its multifaceted ecology. In the future, the influence and growth of qualitative corpus analysis are likely to be spurred by both the "social turn" in many subfields of linguistics, favoring in-depth, contextually grounded methodological approaches to data analysis, and breakthroughs in computer technologies, alleviating the laboriousness of the processes of manual corpus compilation and retrieval.

Qualitative Language for Specific Purposes Research

JOHN FLOWERDEW

The majority of the languages for specialized purposes (LSP) movement literature have been developed in the context of English. While there is considerable literature on other languages, for example, French, German, and Spanish, because of the international role of English as a lingua franca, the greatest interest has been in that language. Another entry would be required in order to deal with the non-English research.

The concept of specialized language and, following that, English for specific purposes (ESP) as a pedagogical endeavor, developed out of work by Halliday and his colleagues in the 1960s on language register (Halliday, McIntosh, & Stevens, 1964); register being defined as a language variety used for a particular purpose or in a particular social setting. Some early ESP work was quantitative in nature, but Widdowson (1978) was critical of this sort of quantitative analysis, arguing that linguistic form by itself does not give an indication of communicative function. Widdowson, accordingly, argued for a more functional orientation, at the same time insisting that language needs to be analyzed as discourse (i.e., above the level of the sentence) if form–function relations are to be identified. At about the same time, work was also conducted at the University of Washington on *rhetorical functions*, the language of, for example, description, classification, definition, comparison and contrast, and cause and effect in technical language, which again insisted on the need for linguistic description to look above the level of the sentence (see Trimble, 1985, for a summary of this work).

In a further development, a study by Tarone, Dwyer, Gilette, and Icke (1981) narrowed the focus of analysis further, limiting itself to considering one discipline, astrophysics; one genre, the research article; and one linguistic feature, the passive, the assumption being that the study of language variation cannot take the broad sweep that quantitative register analysis took, but must be limited to specific uses in specific contexts. In addition, Tarone et al. (1981) introduced a specialist informant, an astrophysicist, to the research, in order to obtain an “insider” interpretation. The use of specialist informants in ESP research has since become common, as has the “discourse-based interview,” where specialist writers are invited to comment on their texts. Hyland’s (2000) more recent work on disciplinary discourses is a prime example of the use of such interviews, in his case to support more quantitative corpus-based analysis.

The next, and still prevalent, approach to language description for ESP was genre analysis (Swales, 1990; Bhatia, 1993). Early work using this approach focused on determining communicative purposes of genres, as manifested in staged “moves” and how these purposes were determined by discourse communities (insiders regularly using the genres). This work typically focused on more formulaic and predictable genres such as the research article and the business sales letter. Probably the best known study was that of Swales (1990), where he analyzed the introductions to research articles into three communicative moves. The overall purpose of the introduction, Swales claimed, is to create a research space (hence the term CARS model as it is often referred to), the three moves (each with associated steps, or submoves) being: establishing the field, establishing a niche, and occupying the niche.

2 QUALITATIVE LANGUAGE FOR SPECIFIC PURPOSES RESEARCH

More recently, under the influence of American composition studies and the “new rhetoric,” or “rhetorical genre studies,” greater emphasis has been put on the unpredictable nature of genres and the need in ESP to pay more attention to features external to the actual text, such as how genres function in genre networks, how genres often mix one with another, how they may vary according to discipline or profession, how they can be manipulated to rhetorical effect, and how they change over time. Whereas ESP approaches to genre are primarily text-oriented, new rhetoric researchers use more ethnographic techniques. Related to the “rhetorical genre studies” approach, Swales (1998) developed what he called “textographies,” a hybrid approach involving both text analysis and ethnography based around texts.

As a result of more complex conceptualizations of genre, pedagogy has moved from a formulaic matching of moves and linguistic realizations to a more broadly based pedagogy involving contextual as well as linguistic analysis. Flowerdew and Wan (2010), based on combined naturalistic studies of how genres are created by accountants and how these genres are realized linguistically, argue for an ESP approach to genre which takes both the contextual and the linguistic dimensions into account, Flowerdew and Wan arguing that the combined value of the two approaches is equal to more than the two parts taken separately. In more recent work on genre, in a series of articles and using qualitative case-study methods, Cheng (2007) has started to investigate systematically the acquisition of genre in so-called genre-based pedagogy classroom contexts.

Although genre has been the most influential area of research and application for ESP in recent years, other approaches have also been developed. One such approach is contrastive rhetoric, where rhetorical differences between different languages and how features in the first language may affect the way individuals may express themselves in the second language (L2) is the focus of enquiry. This approach has, indeed, a much longer history than genre analysis, going back to the 1960s. After a period during which it fell out of favor, it has now come back into fashion. Considerable LSP research has been conducted using this approach, in Europe, in particular. Genres and languages/cultures which have been investigated include conference abstracts written by Ukrainians, research article introductions written by Spaniards, argumentative essays written by Eritreans, and research grant proposals written by Scandinavians. Most of this research, it should be noted, has been conducted in the area of academic discourse.

Another approach which has been used to investigate academic discourse, in particular, is naturalistic enquiry. Here, the emphasis is less on the actual language used and more on the beliefs, values, attitudes, and behavior which underlie such use. Using ethnographic techniques, such as (participant) observation, interview, audio, and video recording, the goal in this type of research is to develop “thick descriptions” which can be developed into explanatory interpretative accounts. Such analysis is usually based on prolonged engagement with the research participants. In one study, Flowerdew and Miller (1995), on the basis of a naturalistic study of Western university lecturers and their Hong Kong Chinese students, proposed a cultural model for L2 lectures consisting of four dimensions: ethnic culture, academic culture, local culture, and disciplinary culture. In a rather different context, South Africa, using interview data and pieces of student writing, Angélie-Carter (1997) analyzed a student’s investment in prior discourses and the way these discourses hindered and facilitated his acquisition of written academic discourse. Prior (1998), in a much quoted study, used ethnographic methods to study how graduate students socialize themselves into a discipline through their writing. One important benefit of naturalistic research such as this is pedagogic, the assumption being that a better understanding of the motivations and behavior of the participants in the selected sites of engagement can feed into better pedagogy. However, researchers are careful not to make broad generalizations on what are situated studies.

While the work reviewed thus far has been descriptive, explanatory, and interpretive—influenced by work in critical theory and critical pedagogy—a certain element of criticality has entered the field. An early example of such work is that of Benesch (2001), who argued that needs analysis, which has always been a pillar of ESP practice, should incorporate what she referred to as “rights analysis.” Rights for Benesch are political and negotiable, while needs may not be. Benesch (2001), in fact, applied critical pedagogy to the whole EAP (English for academic purposes) enterprise, highlighting the latter’s roots in “pragmatism.” Benesch’s position is that students should be encouraged to participate in the setting of their curriculum. In terms of research method, Benesch’s ideas are developed around her own experience as an EAP teacher in a New York university. Prior to Benesch, Pennycook (1997) had laid the ground for a broader critical approach to EAP, questioning the “pragmatic” credentials of the whole EAP enterprise and arguing that it may be culturally intrusive and hegemonic of Western values. His ideas were debated in an exchange of views with Allison (1996), who argued in support of the more pragmatic approach.

Another area of ESP research that has been receiving a lot of attention recently is that of English for research and publication purposes (ERPP). This research acknowledges the fact that many researchers and postgraduate students need to publish the results of their work in international journals published in English and that this represents a particular challenge for users of English as an additional language. Researching these issues has mostly taken the form of naturalistic enquiry. Following a large-scale survey and in-depth interviews concerning these issues in Hong Kong, Flowerdew (2000) followed a young scholar in his efforts to achieve publication of his manuscript, analyzing the text of the multiple drafts of the manuscript, the correspondence with editors and interviewing the research participant. Similar work has been done by Li in the context of Mainland China (e.g., Li, 2006) and in the European context by Lillis and Curry (2010).

Not developed within the context of ESP research, another approach to address issues of academic reading and writing has developed in the United Kingdom, that of “academic literacies.” The particular emphasis of this approach is on writing (and reading) as social practice and as shaped by the context in which it is created. Although not normally considered as part of ESP, this approach nevertheless has a great deal to offer to that field, in its qualitative case study approach and in its focus on the situated aspects of language more than the language itself.

Perhaps because those working in universities are more likely to do research than those working in other professional spheres, most ESP related research has been conducted in EAP. Nevertheless, a body of research of relevance to English for occupational purposes (EOP)—particularly business English—has been developed alongside the more mainstream ESP literature (see Bargiela-Chiappini, Nickerson, & Planken, 2007, for review). Much of the early work in the 1980s and 1990s focused on the business letter. More recently attention has turned to other genres such as e-mails, mission statements, spoken presentations and, in particular, business meetings. Given the increasingly international nature of business, a considerable amount of work has gone into intercultural issues and interactions, Scandinavian business schools providing a lot of the impetus for such work (Bargiela-Chiappini et al., 2007).

At the beginning of this review it was stated that the greatest amount of literature in LSP was to do with English and has been in response to the tremendous expansion of that language as an international lingua franca. This short entry has tried to give an idea of the scope of this research. With the forces of history and economic power moving eastwards, it is quite possible that there will be an increasing demand for Chinese to develop in a similar direction. For the moment, though, English remains preeminent.

Qualitative Literacy Research

RUTH HARMAN

Qualitative literacy research, developed in the fields of anthropology and sociology, is often defined as a research approach that focuses on interpretation; on how people interact with and make meaning of texts in particular social and cultural contexts. However, such a definition does not capture adequately the complex research process of a qualitative literacy study. Specifically, when conducting research, qualitative researchers need to have specific views on what literacy is (ontology), how it is structured and constructed (epistemology), and how it can be analyzed (methodology). In deciding upon a particular interpretive paradigm, often informed by interpretive, critical, or poststructuralist orientations to literacy, researchers are also influenced by the lens and sociohistorical traditions of their interpretive community (Kamberelis & Dimitriadis, 2005).

Similar to the trend in social sciences and humanities, qualitative literacy research has become an increasingly popular approach among second language researchers over the past thirty years. Qualitative research strategies in applied linguistics now include ethnographies, case studies, diary studies, narrative analysis, and discourse analysis among other approaches. Through these methodologies, second language researchers explore the subjective and social experiences of multilingual members of cultural communities as they interact with written or oral texts and other related semiotic systems. Because the majority of recent research in the field has been undertaken from sociocultural and critical perspectives of literacy, this entry provides a brief history of the emergence of these approaches along with a discussion of literacy studies in applied linguistics and related fields.

Literacy as Social Practice

In a seminal study about literacy studies, Street (1984) divided research into two broad and competing categories. In the first domain, he critiqued research which conceptualized and investigated reading and writing as “autonomous” mental processes with little focus on how they were embedded in particular social practices. This cognitive-based perspective still dominates other perspectives in second language literacy and language acquisition journals. Through experimental, quasi-experimental, or longitudinal case studies, AL researchers investigate issues such as how crosslinguistic factors or code switching influence the reading or writing proficiency of second language learners.

In the second category, Street placed research, including his own anthropological work, which subsumed the cognitive aspects in a larger exploration of the social and ideological factors integral to literacy practices. In other words, studies about reading and writing events involved an investigation of the larger social “Discourses” (i.e., cultural ways of knowing, thinking, and doing), which were shaped by sociohistorical factors and circulation of power (Gee, 1990). Although recent literacy researchers have questioned the overarching focus on the local in this view of literacy as social situated practice (e.g., Brandt & Clinton, 2002), the approach was and still is highly influential in generating a large number of ethnographies, case studies, and other research strategies in AL and education.

New Literacy Studies

To explore how oral language and other semiotic systems (e.g., drawing) functioned as integral elements of situated and organized literacy practices, qualitative researchers in the late 1970s and early 1980s began to draw from methodologies of sociolinguistics, ethnography of communication, interactional sociolinguistics, and discourse analysis. Particularly influential in education studies and applied linguistics, ethnography of communication provided researchers with strategies to analyze how social discourse socialized children not only into a system of language use but also into the cultural assumptions, values, and purposes of a specific community (e.g., Cazden, John, & Hymes, 1972).

Heath (1983) used this analytic approach in her seminal longitudinal study *Ways with Words* to investigate how children in three discourse communities in North Carolina were socialized into making meaning of texts in culturally divergent ways, some of which were misunderstood and silenced in school. Implications from Heath's study pointed to the importance of validating community literacy practices in school contexts. Informed by her approach, second language researchers explored the mismatches between home and school sociolinguistic norms and interactional practices for bilingual children.

Early sociocultural literacy studies such as Heath's were also highly influential because they demonstrated how school literacy was only one of many ways that cultural groups used texts for organized social purposes. This "deschooling" of literacy paved the way for a proliferation of ethnographies and case studies on academic, workplace, prison, online, and youth literacy practices. Broadly referred to as new literacy studies (NLS), researchers explored how literacy practices differed across and within social domains, how they interacted dialectically with institutional and societal discourses, and how individual users and groups appropriated and resisted them (Gee, 1990; Barton, Hamilton, & Ivanič, 2000). For example, Harklau's (2000) ethnographic study compared how the same language learners were afforded a different set of literacy practices (e.g., curricula and classroom discourse) and social identities in their last year of secondary school and first year of community college. The study also highlighted how the institutional representations of immigrant students, conveyed through institutional and classroom practices, were appropriated and recreated by the students in one context and actively resisted in the other.

Multiliteracies

In the mid-1990s, with the advent of increasingly complex technologies of communication, the New London Group (1996) published a seminal article on multiliteracies, which encouraged researchers and educators to conceptualize literacy as a dynamic set of social semiotic processes that involved multiple modes (e.g., linguistic, visual, spatial, kinesthetic), media, and discourse communities. In classroom research, literacies often ignored in previous research (e.g., home, digital, personal, and community practices) were now investigated to see how the nexus of knowledge bases influenced and informed students' learning experiences.

Research explored, for example, how learners "redesigned" elements from popular media, graphic novels, and comic books for their own purposes. Dyson's ethnographic studies (e.g., 2003) showed how early elementary school children remixed voices from community, home, and popular media into their drawing and writing, when supported to do so by the permeable curricula of their teachers. On the other hand, Duff's (2004) discourse analysis study found that second language learners in two Canadian high school classrooms

lacked the necessary cultural and linguistic background to understand the hybrid classroom discourse that included multiple references to local popular culture. In other words, the interweaving of popular and instructional references in classroom discourse served as a dynamic third space for local students, yet as a marginalizing tool for immigrant students.

Research also explored the hybrid identities enabled by digital literacy practices such as online discussion forums, anime fan fiction, interest-based e-mailing lists, virtual worlds, and other participatory web activities. In several qualitative case studies, Lam (e.g., 2009) found that Asian immigrant youth, who had difficulty communicating in school, strategically redesigned an array of semiotic resources in digital contexts to expand their transnational communities and social identities. Similarly, Black (2005) showed how the multilingual and multicultural nature of anime fan fiction provided second language learners with the opportunity to fully participate and act as cultural resources for other fan fiction writers.

Academic Language and Literacies

In cognitive-based research, academic literacy and language are often treated as separate autonomous processes with clear developmental steps that can be measured. In socio-cultural studies, on the other hand, academic literacy is conceptualized in ecological ways that often include exploration of cognitive, linguistic, out-of-school, personal and academic elements. For example, linguistics has played an increasingly important role in literacy research since the 1980s. Some of the most influential linguistics studies in K-12 contexts have been informed by systemic functional linguistics (SFL), which show how academic discourse knowledge is construed through use of a particular range of linguistic and structural choices that differ according to register, purpose, and audience. Schleppegrell (2004), for example, analyzed the patterns of meaning in science discourse that build description of natural phenomena through accumulated use of grammatical metaphor and tight clause cohesion. In other words, academic literacy is conceptualized and researched as a semiotic process.

Perspectives on what constitutes academic learning also vary in recent research. For example, researchers informed by sociocultural theories of language and literacy investigate how students' understanding of academic concepts is mediated and shaped by the complex interaction of classroom discourse, curriculum resources, and past experiences. Hawkins (2004) found that the agency, personal histories and cultural tools of two kindergarten English learners led them to negotiate a classroom ecological system in ways that provided them with differential access to school literacies. Also informed by theories of language socialization, researchers have investigated how second language learners are facilitated and constrained from becoming full literate members of different content literacies, depending on whether the hidden cultural assumptions and norms of the classroom discourse are made explicit or not.

In recent research, exploration of academic content areas also has been informed by a multiliteracies perspective. Moje et al. (2004), for example, found that the community and home funds of knowledge of middle school Latino students in Detroit mediated understanding of scientific concepts. For example, their parents' occupations provided them with lived knowledge and understanding of issues related to air pollution and quality. However, the researchers also found that these sources of knowledge remained hidden or silenced in classroom discourse. The authors, along with other researchers informed by a similar perspective on literacy, call for a third space that recognizes diverse funds of knowledge as integral elements in content literacy classrooms.

Critical Literacy Research

Although the term “critical” is used in divergent ways in qualitative literacy research, researchers share some basic tenets. First of all, critical researchers see literacy practices as having an ideological orientation, which means that they are shaped by the cultural values and assumptions of a particular “Discourse” (Gee, 1990). Based on this perspective, researchers investigate how and why the sociohistorical norms of institutional literacy practices such as those in education or medicine privilege some social groups and marginalize others.

Through research strategies such as critical discourse analysis, critical researchers have explored issues of resistance, resilience and power relations as they relate to literacy practices embedded in particular institutional discourses. In an institutional ethnography and critical discourse analysis study, for example, Gebhard (2005) showed how the organizational structure of schools and curricula in a post-Fordist California school system reflected and enacted larger social discourses that attributed marginalized status to English learners. Similarly, studies by Gutierrez and her colleagues used discourse analysis to investigate the social heteroglossia in school classrooms. Gutierrez, Rymes, and Larson (1995) analyzed how an urban school teacher exhibited a scripted and fixed notion of student/teacher identities in his interactions with his culturally diverse students and how the students, in turn, constructed an oppositional script that had little room for negotiation.

Along with their questioning of the discourses and ideologies underlying particular literacy practices, critical scholars often feel they need to contribute to improved social equity for the participants in their research studies. This belief in the potentially transformative nature of research has led to new ways of researching literacy such as participatory action research (PAR). PAR studies have documented how students designed and implemented social action research that emerged from their own interests, and not from questions raised by outside researchers or by teachers.

Poststructuralist Literacies

In a seminal article, Brandt and Clinton (2002) critiqued NLS researchers for an overemphasis on social issues in situated literacy events without accounting for the circulation of power from local to global contexts. The authors recommended that literacy be theorized as an actor or object that is appropriated by users in specific ways but whose meanings and purposes exceed the local articulation.

In recent second language research, especially in the context of digital and transnational studies, literary practices have been conceptualized as developing through a complex interweaving of cultural flows. For example, Pennycook (2007) explored how the trans-cultural flow of hip-hop involved a shunting and shifting of the form in dynamic ways when picked up by local users in locations as distant from one another as Senegal or Australia. The moves among these cultural appropriations led to a constant remixing, borrowing, and blending of languages, cultures, and identities.

Other poststructuralist studies deconstruct tidy categories in second language and literacy studies such as questions of attitude and motivation. For example, in her ethnographic study Norton (2000), pushed back against what she perceived to be too narrow a definition of motivation and identity in theories of second language acquisition (SLA). Informed by feminist poststructuralist theories of identity and language, she showed how the language learning of a group of immigrant women was shaped by their subject positioning in particular social and cultural contexts.

The reflexive turn in critical and postmodern research has also led to epistemological divides in qualitative approaches. Some researchers integrate postmodern critiques and notions of representation with traditional modes of qualitative inquiry. Others use alternative forms such as performance and auto-ethnography to research and represent the fluidity and multifaceted nature of identity and the problematic dynamics between researcher and the researched.

Conclusion

Over the past forty years, research on situated, academic, digital, and translocal literacies has galvanized researchers into exploring issues of meaning making, social identity, and text/context relationships in increasingly nuanced and innovative ways. In applied linguistics, however, a key challenge for researchers is the continued favoring of quantitative over qualitative research in the field. Qualitative researchers still tend to be defined and judged in binary opposition to quantitative researchers. They also tend to have more difficulty in obtaining national funding if their work assumes a critical or poststructuralist orientation to literacy.

Despite these challenges, qualitative literacy researchers continue to explore exciting new directions in the field. To address social equity, for example, critical participatory action research incorporates student voices and funds of knowledge as an integral element in their research design and implementation. In addition, new studies on immigrant and transnational identities from poststructuralist and critical feminist perspectives push the boundaries on how to conceptualize and research issues of language, power, and culture.

Qualitative Methods: Overview

PHIL BENSON

Introduction

Discussions of qualitative research usually begin by contrasting qualitative with quantitative approaches. Quantitative research may best be defined as research that relies on the reduction of data to numbers and statistical argument, and typically aims to produce knowledge that holds true of relatively large populations. In applied linguistics, quantitative approaches are often underpinned by theoretical assumptions about universal language learning processes and the influence of contextual factors such as gender, culture, and sociopsychological differences. Qualitative research in applied linguistics takes many forms and may best be defined as research that relies mainly on the reduction of data to words (codes, labels, categorization systems, narratives, etc.) and interpretative argument. In applied linguistics, qualitative research is also associated with a focus on the individual and the particular in regard to “cases” as subject matter, the visibility of the researcher and the specificity of findings. Whereas quantitative research findings are, in principle, unrelated to the identity of the researcher, qualitative findings are always contingent upon particular processes of data collection, analysis, and interpretation carried out by particular individuals in particular settings.

Historical Background

The rigorous approaches to qualitative research that are typical of published work in applied linguistics today have evolved from the less systematic approaches that prevailed for much of the 20th century. Applied linguistics research first became systematic through the adoption of quantitative methods from psycholinguistics and sociolinguistics in the 1960s and, with the rise of second language acquisition research in the 1970s, quantitative approaches became the norm. From the mid-1990s onwards, this norm has been challenged by qualitative research, although quantitative studies continue to dominate in purely numerical terms. More recently, there has been greater acceptance of the legitimacy of qualitative research and a growing interest in “mixed-methods” approaches that combine qualitative and quantitative methods.

In principle, a qualitative study represents one researcher’s interpretation of a particular case or phenomenon, but the reader must also be able to see that this interpretation is based on rigorous treatment of data. The guidelines for qualitative research papers published in *TESOL Quarterly* from 2003 onwards were a significant landmark for qualitative research in applied linguistics (Chapelle & Duff, 2003). Yet there remains no single well-defined approach with an exclusive claim to the title “qualitative research.” In addition to referring generally to research that uses qualitative methods, the term is also used to describe approaches such as ethnography and conversation analysis, which were well established before the concept of qualitative research came on to the scene. It is also used at times to describe approaches such as case study, discourse analysis, and action research that do not necessarily exclude quantitative methods. In applied linguistics, moreover, while some writers explicitly identify their research as “qualitative,” many more simply

2 QUALITATIVE METHODS: OVERVIEW

use qualitative methods without using the this term (Benson, Chik, Gao, Huang, & Wang, 2009).

Applied linguistics has traditionally lagged behind other areas of the social sciences in the adoption of new research methodologies. The qualitative–quantitative “paradigm wars” of the 1970s and 1980s in which new interpretative approaches were seen as being incommensurable with quantitative approaches (Bryman, 2006) coincided with the rise of quantitative methods in applied linguistics. The first applied linguistics research manuals also dealt mainly with quantitative methods and statistical procedures (Brown, 1988; Seliger & Shohamy, 1989) and it was not until the early 1990s that qualitative methods made a significant appearance (Johnson, 1992; Nunan, 1992). Since the turn of the 21st century, it has become routine for research manuals to cover both quantitative and qualitative research, one of the more important recent examples being Dörnyei (2007), while three recent volumes have been devoted exclusively to qualitative approaches (Holliday, 2002; Richards, 2003; Heigham & Croker, 2009). Yet it would be fair to say that the quantitative–qualitative paradigm wars never really reached the shores of our field. While qualitative research was fighting for space in applied linguistics in the 1990s, the social sciences were already in the grip of a “proliferation of paradigms” (Wright, 2006) that is only now beginning to spill over into applied linguistics.

Qualitative Research in Applied Linguistics Journals

In a special issue of *TESOL Quarterly* on qualitative research, Lazaraton (1995) observed that few qualitative studies had been published in applied linguistics journals up to that point. Surveys at the turn of the 21st century, however, showed that the number of qualitative papers increased steadily during the 1990s (Gao, Li, & Lü, 2001; Lazaraton, 2002, 2005). More recent surveys suggest that the contribution of qualitative research papers has stabilized since the turn of the 21st century, and that qualitative papers remain in the minority in most journals (Benson et al., 2009; Richards, 2009). Benson et al. (2009) surveyed 10 international journals from 1997 to 2006 and found that *Applied Linguistics*, *Canadian Modern Language Review*, *Foreign Language Annals*, *Modern Language Journal*, *System*, and *TESOL Quarterly* were the most open to the publication of qualitative research, but that *International Review of Applied Linguistics*, *Language Learning*, *Language Testing* and *Studies in Second Language Acquisition* clearly preferred quantitative studies. The proportion of qualitative papers in individual journals also varied greatly, ranging from 43 percent in *TESOL Quarterly* to 4.5 percent in *Studies in Second Language Acquisition*, although none of the 10 journals surveyed have editorial policies that explicitly favor quantitative or qualitative research.

Benson et al. (2009) estimated that, on average, journals currently devote around 20 percent of their space to qualitative studies. More significantly, they identified more than 450 high-quality qualitative studies, suggesting that the database of studies was increasing year-by-year. This no doubt represents only the tip of the iceberg of qualitative research published as journal papers, book chapters, books, and theses. Journal surveys have also looked mainly at branches of applied linguistics concerned with language teaching and learning. A broader survey of the field would certainly reveal an even greater contribution of qualitative research.

Approaches to Qualitative Research

Commentators vary in their views of the most important approaches to qualitative research in our field. Davis (1995) identified qualitative research almost exclusively with work on language socialization and the ethnography of communication, while Lazaraton (2003) described ethnography and conversation analysis as the two main approaches in the field.

Gao et al. (2001) referred to a much broader range of approaches, including text analysis, ethnography, narrative inquiry, verbal reports, and classroom interaction. Richards (2003, p. 13) discussed seven “core traditions” of relevance to language teaching and learning: ethnography, grounded theory, phenomenology, case study, life history, action research, and conversation analysis, while Heigham and Croker (2009) includes chapters on narrative inquiry, case study, ethnography, action research, and mixed methods. Among these approaches, grounded theory and phenomenology have a very limited presence in applied linguistics, while action research is perhaps underrepresented in published work (Richards, 2009).

One of the difficulties in identifying approaches to qualitative research in applied linguistics, however, is that researchers often draw upon established approaches without necessarily subscribing to their underlying philosophies. Grounded theory, for example, is frequently cited in applied linguistics studies to signal an approach to data analysis, in which themes “emerge” from repeated reading of the data, but usually without reference to grounded theory as a philosophical and methodological approach to theory generation. Benson et al. (2009) also found that less than one third of the papers in their database explicitly identified with qualitative research or a named qualitative tradition such as ethnography or conversation analysis. The remaining two thirds simply used qualitative methods without naming their approach, or described themselves as, for example, “longitudinal,” “classroom interaction,” or “interview” studies. This points to an eclectic approach to qualitative research that is not strongly driven by philosophical or paradigmatic considerations. Indeed, applied linguistics research is now very often carried out by practitioners on scales that are too small to permit statistical inferences. Qualitative research is increasingly becoming synonymous with small-scale research, for which qualitative methods are the default.

Based on this broader view, it could be argued that case study and discourse analysis, rather than ethnography and conversation analysis (Lazaraton, 2003), are the two main forms of qualitative research in applied linguistics, or rather, that ethnography and conversation analysis now form part of the much larger categories of case study and discourse analysis, from which they are not always easily separated in terms of philosophy or the use of methods. Longitudinal research, think-aloud and stimulated recall, and narrative inquiry also make a small but significant contribution as distinctive qualitative approaches.

The tendency towards eclecticism is also reflected in ideological aspects of qualitative research. For the editors of one major collection in the social sciences, qualitative research is part of a move towards “a social science that is committed up front to issues of social justice, equity, nonviolence, peace, and universal human rights” (Denzin & Lincoln, 2005, p. 13). Lazaraton (2003, p. 3), on the other hand, argued that qualitative research in applied linguistics has no “clear sociopolitical agenda.” This is no doubt true of the majority of qualitative researchers in the field, but it is equally true that applied linguists who subscribe to “sociocultural” theoretical frameworks, such as sociocultural theory, communities of practice, social realism, and ecological approaches, have tended to opt for qualitative methods. Croker (2009) also notes how critical theory, critical race theory, and feminist theory have generated research approaches such as critical discourse analysis, critical ethnography, and critical action research. The presence of these approaches in published work is limited, however, and the overall picture is one of a more pragmatic approach to the use of qualitative methods.

Data Collection Methods

In addition to a chapter on qualitative research traditions, Richards’s (2003) includes chapters on interviewing, observation, and spoken interaction data, while Heigham and Croker

(2009) include chapters on observation, interviews, open-response questionnaire items, verbal reports and diaries, and discourse analysis. These methods cut across approaches to qualitative research and it is often their use, alone or in combination, that allows us to identify applied linguistics studies as qualitative.

From the perspective of methods, qualitative applied linguistics studies can be divided into two broad types: studies investigating people and social processes involved in language teaching, learning, and use and those investigating the properties of discourse or texts. Adopting the view that qualitative research is essentially concerned with people and social processes, Richards (2009, p. 152) considers that discourse analysis is only qualitative research if it focuses on the “individual or social dimension” of discourse. Around a quarter of the qualitative papers surveyed by Benson et al. (2009) used some form of discourse analysis as their main research method and the vast majority of these were indeed concerned with individual and social dimensions of (mainly spoken) discourse. Qualitative methods, in fact, have been the norm in linguistically oriented discourse analysis since the 1970s, with quantitative corpus-based methods making a relatively late entry into the field. What is of interest here, therefore, is the growing use of discourse methods to investigate processes of language teaching, learning, and use, in particular through emerging approaches such as “microanalysis of classroom discourse” (Zuengler & Mori, 2002), “conversation analysis for SLA” (Markee & Kasper, 2004), and “linguistic ethnography” (Tusting & Maybin, 2007).

A second point of interest is the growing use of multiple data sources in qualitative research. Benson et al. (2009) identified 12 distinct types of data in nondiscourse studies: interview and focus group transcripts; observation records and field notes; samples of student work; audio recordings of interactions; diaries and journals; policy, curriculum, and course documents; think-aloud protocols; stimulated recall protocols; open-ended questionnaire responses; video recordings; course evaluation data; and teachers’ feedback on students’ work. Around two thirds of the studies drew on two or more of these sources and one fifth used four sources or more. More than 50 different combinations of data were identified, although in many of the multimethod studies the findings section covered only one or two of the data sources. Certain patterns did stand out, however, and to simplify the picture somewhat, we might say that qualitative research in applied linguistics tends to draw on four main sources of data: interviews, audio recordings of interactions, observation records, and samples of students’ work. These are used both singly and in a variety of combinations. Interviews and audio recordings also dominate in two senses: they are both the most frequently used sources in data collection and, in multimethod studies, the most frequently analyzed sources in the findings sections of papers.

Data Analysis Methods

Data analysis is perhaps the most problematic aspect of qualitative research in applied linguistics for several reasons. In contrast to data collection, data analysis is often described rather vaguely, if at all. The data discussed in findings sections may also represent no more than a fraction of the data described in the methods section and criteria for selecting the data to be discussed are often left unexplained. Lastly, terms such as “grounded theory” and “conversation analysis” are often substituted for a more detailed outline of data analysis procedures. Ortega and Iberri-Shea (2005) explain similar tendencies in longitudinal research by the constraints of the journal article format and academic pressure to publish articles before long-term projects are completed. A point that could be made here is that the length and format of journal articles has evolved mainly to accommodate quantitative studies. Qualitative researchers are better served by book and thesis formats and by the greater freedom that editors of thematic books are often able to provide.

One striking feature of qualitative research in applied linguistics is the tendency to convert all kinds of data to written form before analysis. Interviews, for example, are transcribed and quoted verbatim. In observation studies, field notes are increasingly replaced by audio and video recordings, which are also transcribed. These practices enhance rigor and transparency, but there is often a tendency, especially in ethnographies and case studies, to formalize procedures and lose sight of the bigger picture of the phenomenon under study. Multimethod studies also tend to prioritize data that are readily convertible to text. Interview and observation, for example, are the most frequently combined data collection methods, but observational data usually play a supplementary role. Findings sections are often built around extracts from interview transcripts, while observational data are used mostly as a source of contextual information. This may well be a consequence of our particular interest in language and text in a field in which, as Richards (2009, p. 159) puts it, “the bedrock exerts a magnetic pull towards linguistic analysis.” Qualitative research in the social sciences certainly seems to be less rigorous in regard to the transcription and verbatim quotation of data and more open to interpretative analysis.

Issues of Quality

In her manual on classroom research, McKay (2006) lists nine contrasts between qualitative and quantitative research, including assumptions about the nature of reality, the roles of researchers, the purposes of research, approach to research questions, and a variety of issues concerned with research design and methods. This is, in a sense, a hierarchy of contrasts, in which those at the end of the list are, in principle, conditioned by those at the beginning. From this perspective, qualitative studies do not simply use qualitative methods, but rather use them in the context of a broader qualitative understanding of the nature of reality, the roles of researchers, the purposes of research, and so on. Like many other qualitative researchers, Croker (2009, p. 6) connects quantitative research to the positivist assumption that “there is only one, fixed, agreed upon reality, so research must strive to find a singular, universal ‘truth’” while qualitative research is connected to the constructivist view that “each individual creates his or her own unique understandings of the world, so there are multiple constructions and multiple interpretations of reality.” At the level of research design and method, on the other hand, Richards (2009, p. 149) identifies studies as qualitative if they are locally situated, participant-oriented, holistic, and inductive. Issues of quality in qualitative research are related, in part, to the fit between these levels of research philosophy and research design.

One noteworthy feature of qualitative research in applied linguistics is its tendency to be influenced by quality considerations that appear to be more appropriate to quantitative studies. Dörnyei (2007, p. 55), for example, observes that when quantitative researchers criticize qualitative research for not following “scientific method” or for having “too small sample sizes,” they are essentially saying that qualitative research is not “quantitative enough.” In principle, a qualitative study might investigate a single case with the aim of producing a purely interpretative insight into its nature, without any attempt at generalization. Studies of this kind are relatively infrequent in the applied linguistics literature, however, and mainly use longitudinal or narrative methods. The more typical qualitative study covers a small number of cases and involves, at least implicitly, a sample, a set of research questions, and some attempt to generalize based on rudimentary quantification of data. It is widely acknowledged that qualitative research does not preclude the use of numbers. It is less often observed that, once researchers begin to quantify data by, for example, reporting what “most,” “some,” or “few” of the participants said or did, their research is potentially open to scrutiny according to quantitative criteria.

A debate on this issue, which is yet to be resolved, emerged around the “qualitative research guidelines” that first appeared in the 1994 winter edition of *TESOL Quarterly*, which were initially based on ethnography and criticized for setting up arbitrary epistemological guidelines for would-be authors (Lazaraton, 2003). In the 2003 winter edition, the guidelines were expanded to include separate sections on case study, conversation analysis, and (critical) ethnography. There is a clear intention in these guidelines to raise standards for qualitative research to match those that apply to quantitative research. Yet in a commentary on the guidelines, Shohamy (2004, pp. 728–9) urged researchers to be “cautious that the guidelines do not restrict innovations in research designs by imposing fixed categories and forcing research into sealed boxes.” Researchers should, she argued, feel free to “mix and blend different methods in the long journey towards answering research questions.” Dörnyei (2007, p. 28) also observes that, despite the importance of rigorous and systematic procedures, “at the heart of any qualitative analysis is still the researcher’s subjective sensitivity, training, and experience,” while Richards (2009, p. 158) notes that checklists and guidelines are “no substitutes for systematic, sensitive and careful analysis.”

While this emphasis on the quality of the researcher is more or less standard among qualitative researchers, it is not yet clear that the field of applied linguistics as a whole is prepared to accept qualitative research on these terms. Arguably, there has also been insufficient attention to issues of quality that are internal to qualitative research, such as the frequent tendency to treat interview or narrative data as factual evidence, rather than as problematic texts co-constructed by the researcher and participants, or the tendency noted above to treat multiple cases as “small samples.” It is perhaps worth noting that qualitative researchers in applied linguistics often feel that they are under pressure to make their work comparable to quantitative research in order to get it published. It is possible, therefore, that these issues will only be resolved when the field as a whole acquires a greater awareness of the distinctive contributions to knowledge that qualitative research can provide.

Research Areas, Frameworks, and Themes

The most interesting, but least explored, aspect of the rise of qualitative research in applied linguistics concerns its distinctive contribution to knowledge in the field. What are we now discovering through qualitative research that several decades of quantitative research have failed to reveal? Paradoxically, this is a difficult question to answer straightforwardly, because there is now so much published qualitative research in the field. It can be answered indirectly, however, by looking at the areas of applied linguistics in which qualitative researchers have been most active, the theoretical frameworks to which it is linked, and certain themes that have begun to emerge across different areas.

Among the areas to which qualitative research has made the greatest contribution, migration, classroom research and writing research stand out most prominently. Migration has become a prominent area of applied linguistics research in recent years and has primarily been investigated through the experiences of individual migrants using ethnographic and narrative methodologies. Some of the most interesting and compelling research documents experiences of forced migration, but qualitative methods are also increasingly used in research on short-term residence and study abroad. Classroom research is a well established field that has traditionally embraced both quantitative and qualitative approaches, but it has been given new life in recent years by studies of classroom discourse (often using conversation analysis), case studies of classroom life and community, and qualitative studies of teachers’ and students’ beliefs and perceptions of what happens in

classrooms. As Richards (2009) points out, qualitative classroom research, among other contributions, has posed questions about the universal effectiveness of methods such as communicative language teaching. Research on second language writing has also benefited from a shift toward qualitative methods, notably in Matsuda and Silva's (2005) collection of papers, which address methodological issues in writing research from mainly qualitative perspectives.

To identify areas in which qualitative research is prominent, however, is to miss the point that qualitative methods now have a presence in virtually all research areas, including traditional bastions of quantitative methods such as language testing. This wider use of qualitative methods is partly related to the emergence of new theoretical frameworks and themes in research. Although the use of qualitative methods does not imply adoption of any particular theoretical framework, the rise of qualitative research in the 1990s went hand in hand with the debate that crystallized around Firth and Wagner's (1997) critique of the "cognitive and mentalistic" orientations of much applied linguistics research. Although Firth and Wagner's critique was not a manifesto for qualitative approaches, its methodological implications were clear, as SLA research was criticized for giving "preeminence to the research practice of coding, quantifying data, and replicating results," giving "preference to experimental settings rather than naturalistic ones," endorsing "the search for the universal and underlying features of language processes rather than the particular and the local," and prioritizing "etic (analyst-relevant) concerns and categories over emic (participant-relevant) ones" (p. 288). More broadly, the adoption of qualitative methods, whether theoretically motivated or not, has been influenced by Lantolf and Pavlenko's (2001) injunction for SLA researchers to treat language learners as "people" rather than "processing devices." In the light of this link with broadly "sociocultural" frameworks, three key themes have developed out of the rise of qualitative research concerned with identity, individual difference, and social context.

Identity has emerged as a key concept in applied linguistics research and is mainly investigated through qualitative research. Concern with identity arises naturally from the treatment of language learners as people and a corresponding interest in the impact of language learning and use on people's lives. Kinginger (2009), for example, documents a shift in research on study abroad from mainly quantitative studies of language proficiency gains to qualitative studies of learning processes in study abroad settings. This research is beginning to tell us more about the ways in which identity factors influence the success of study abroad and its impact on participants' sense of self as multilingual individuals.

By focusing on case studies, qualitative research is also promoting a stronger sense of the individuality of language learners and users. This is leading to a reconceptualization of individual difference, which has traditionally been understood in terms of social categories and psychological traits, as a product of the unique experiences that individuals accumulate over the course of their lives. Narrative inquiry is playing an important role here, as for example in Benson and Nunan's (2005) collection of papers, which use narrative methods to reconceptualize a number of individual difference variables.

Lastly qualitative research is contributing to an enhanced sense of the richness and uniqueness of social contexts for language learning and the social constitution of language processes. From a qualitative perspective, quantitative research tends either to isolate process from their contexts or to treat context as an external influence on behavior. Through qualitative research, on the other hand, we are gaining a better understanding of the language learner and user as a "person-in-context." In qualitative classroom research, for example, we are increasingly seeing learners and teachers as individuals whose identities are constituted within the context of the classroom, which is itself nested within further layers of institutional and social context.

Conclusion

To sum up, qualitative methods first made significant inroads into applied linguistics in the early 1990s. Since that time, they have become an established part of the research scene, although they are yet to, and possibly never will, supplant quantitative methods. Qualitative methods appear both in the form of established approaches borrowed from the social sciences and in the form of a more eclectic use of methods and techniques. Their use is often theoretically motivated, but more often researchers elect for qualitative methods as a practical solution to conducting small-scale research projects. The latter case may also reflect a shift towards the treatment of research participants as “people,” which implies, for example, that answers to questions might be better sought by asking participants directly in an interview, rather than through the mediation of items on a remotely administered questionnaire.

The most significant development over the past decade, however, is the emergence of a substantial body of qualitative data-based studies and research texts in the field of applied linguistics itself. The rise of qualitative research in our field was, in part, a consequence of researchers exploring the social sciences in an effort to construct a “transdisciplinary” applied linguistics (Rampton, 1997). Qualitative methods arrived, in a sense, along with the social perspectives that researchers brought back from their explorations. This was, without doubt, a healthy trend, but it has also meant that applied linguists have too often relied upon, or uncritically applied, social science methodologies in their work. While the continuance of the trend towards transdisciplinarity is to be welcomed, the next phase in the coming of age of qualitative methods in applied linguistics will undoubtedly involve the development of new methodologies and articulation of standards that are specific to our field.

Qualitative Research in Language Assessment

CONSTANT LEUNG

Introduction

Assessment research addresses a diverse range of issues including identification of disciplinary content for assessment (e.g., subject-based concepts and knowledge in biology or English), principles of assessment, and means of charting students' knowledge and understanding. This entry will look at the heuristic usefulness of qualitative research with respect to these issues in relation to second/additional language assessment. The entry will open with a brief account of the characteristics of qualitative research approaches. The discussion then moves on to a summary report of an exploratory study connected to teacher-based assessment of English as a second/additional language. Some of the issues emerging from this study will form the basis of the concluding remarks which will highlight some of the affordances as well as complexities that qualitative research can generate.

Qualitative Research: Exploring Voices and Actions in Context

In language assessment a good deal of the research and development work draws on quantitative approaches. In quantitative analyses the key concept or theory adopted tends to be used by the researcher to interpret the meanings of individual actions or collective activities deductively. For example, if a theory posits that the length of time spent on studying a language is directly linked to learning outcomes (as indexed by test scores) then one can study this relationship through statistical analysis. At the same time there are many language assessment issues that qualitative research approaches would provide a different kind of analytic purchase. For instance, when a written assignment has been assessed as "satisfactory," or "good" or "60 marks (out of 100)" by raters, we might wish to investigate issues such as how the rubric of marking has been interpreted, what content or text features have been displayed in the student scripts and so on. In other words, what does "satisfactory" mean from the point of view of the raters and test takers?

Bryman (2004, p. 266) suggests that qualitative research in social science has, *inter alia*, three working assumptions:

- the relationship between theory and empirical investigation is often inductive in that the former emerges out of the latter;
- studying human (inter)action requires an understanding of participant meaning/s;
- the social world is constructed through social interaction, it has no independent thing-like existence.

In the second language education field, as Davis (1995, p. 433) observes, one of the key distinguishing characteristic of qualitative research is that it puts a good deal of premium on "gaining an understanding of the actor's meanings for social action." They use research

2 QUALITATIVE RESEARCH IN LANGUAGE ASSESSMENT

tools such as analysis of relevant documents and texts (e.g., examination rubrics and student writings), communication- and interaction-based analysis (e.g., discourse analysis and focus/discussion groups), ethnography/participant observation, interviews, and think-aloud protocol. In the specialist field of English as a second/additional language assessment researchers have used qualitative research approaches and methods, sometimes in conjunction with quantitative approaches, to investigate a wide range of issues. For instance, Breen et al. (1997) conducted classroom observations and interviews with teachers to study the relationship between assessment framework and pedagogy; Davison (2004) used think-aloud protocols, interviews, and self-reports to study different culturally influenced practices in teacher-led classroom assessment in Australia and Hong Kong; Leung and Mohan (2004) carried out discourse analysis of teacher–student and student–student talk associated with reasoning and decision making in a study of classroom-based formative assessment; O’Loughlin (2008) conducted, among other data collection activities, document analysis, and semi-structured interviews with teaching staff and students on the use of IELTS for university selection; Poehner (2008) drew on classroom discourse analysis to build a case for a Vygotskian approach to dynamic assessment in the classroom; and Rea-Dickins (2006) combined classroom observation (field notes and video recordings) of pupil–teacher interaction in classroom-based assessment and interviews with teaching staff to investigate the participant teachers’ orientation and conduct.

In the following section a brief account of an exploratory study is provided to illustrate the ways in which qualitative research can be used to investigate issues in language assessment.

English as an Additional Language: Exploring Teacher Assessment

In England English-language learners (ELLs) in state-funded schools are expected to participate in regular subject lessons, irrespective of their English-language proficiency. All schoolteachers are expected to assist ELLs to develop their English irrespective of their subject specialisms (see Leung, 2009, for a wider discussion). One consequence of this policy is that there is a very wide range of teacher knowledge and expertise in relation to English as a second/additional language (EAL). As teachers are also assessors of EAL whenever they make judgments on students’ performance in face-to-face interaction (often tacitly and nonconsciously), in written assignments, and in formal assessment tasks. Furthermore, when teachers provide feedback to students it can serve a formative purpose to help improve future performance (for a wider discussion on formative assessment, see Leung, 2004; Black and Wiliam, 2006). Therefore it is very important to develop a knowledge of the assessment criteria used by subject teachers when they assess ELLs. The following is a brief account of an exploratory study involving a group of four English (subject) teachers in a highly ethnolinguistically diverse London school (over 75% of the student population were EAL when data were collected in 2005/6). The teachers were Anne (with six years of teaching experience), Janet (25 years), Margaret (3 years), and Sally (25 years) (all pseudonyms).

The data for the empirical explorations are drawn from a set of audio recordings of the four teachers’ think-aloud protocols while marking 12 pieces of writing by six ELLs in the spring term 2006. Participation was entirely voluntary. There was no stipulation as to specific topic/assignments, nor was there any requirement to target particular students, other than that the focal students should be in the process of learning to use the English language. In the event, the student work assessed included a variety of written English assignments in Years 9 and 10 (14- and 15-year-olds) covering topics such as short story

writing and summarizing Shakespeare plays. A total of 1 hour and 35 minutes of audio recording was collected. The marking of written assignments primarily served the formative purpose of improving learning, but it also contributed to teachers' knowledge of individual student progress. For reasons of focus and scope only some aspects of methodology and some of the findings are reported here.

In making the audio recordings the teachers were asked to verbalize what they were thinking and "doing" with the student texts, which would include their reading (sometimes aloud) of the texts and assessing them. They were asked not to be concerned with giving any rationale to explain their thinking. In other words, they were requested not to provide any comments or explanations for a non-present and imaginary third party, such as the researcher who would be listening to and analyzing the data. (For a discussion on think-aloud protocols see Ericsson & Simon, 1993, chap. 5; Green, 1998, chaps. 1 and 2; Young, 2005; Bowles, 2010, chap. 2.)

The audio recordings were orthographically transcribed to assist analysis. The recordings were listened to several times initially to form a holistic sense of the participant teachers' comments with particular reference to quality judgments and formative advice (Seidel, 1998), and to identify discourse indices of teaching writing approaches. For the latter task Ivanič's (2004) six approaches to teaching writing were used as a set of terms for coding purposes where appropriate (see Table 1 below). By explicitly citing Ivanič's work it is acknowledged that the description and analysis process was not entered into *tabula rasa*. Indeed in trying to make sense of what was going on, the author had to draw on own experience and knowledge. As Wolcott (1994) suggests, an important methodological characteristic in qualitative research is to be explicit about one's research purpose/s and the ways in which data have been constructed.

After making several "passes" over the recordings, so to speak, Leung was able to notice some of the teacher utterances which seemed to articulate teacher approaches to teaching writing; these were marked out in the transcripts for further deliberation. Utterances that resonated with Ivanič's approaches were coded first. The utterances that had been coded within a particular recording and across different teacher recordings were compared with one another to see if they were multifaceted (e.g., different kinds of skills picked up

Table 1 Teaching writing approaches (adapted from Ivanič, 2004)

<i>Approaches</i>	<i>Teaching and assessment focus</i>
Skills	Explicit teaching of rule-governed aspects of written language; focus on accuracy of production/reproduction
Creativity	Implicit teaching drawing on language experience; emphasis on interesting content/style
Process	Explicit teaching and modeling of writing processes; unclear assessment focus, probably some attention to evidence of drafting and revision
Genre	Explicit teaching of genres; emphasis on appropriateness of text types and language expressions
Social practice	Explicit teaching where social contexts and purposes are known; implicit teaching where the classroom is constructed to replicate an outside social environment
Sociopolitical	Explicit teaching of social and political analyses in relation to writing; focus on writing as challenge to existing power relations

4 QUALITATIVE RESEARCH IN LANGUAGE ASSESSMENT

by the different teachers in utterances related the skills approach), and if there were utterances which could be interpreted in different ways and could be categorized in more than one way in the light of the overall discourse context. As the analysis progressed utterances which appeared to express teaching approaches that were outside the Ivanič account were also marked. In this phase of the analysis Leung's codings were largely arrived at inductively (although actions were influenced by Leung's knowledge in the relevant fields, for example, Ivanič's framework; in that sense there was an element of deductive reasoning). These additional categories were included in an effort to capture, as Denzin (2002) puts it, the phenomenon under study. Throughout the analytic process there was a good deal of recursive self-conscious examination of the appropriateness of the codings assigned. The overall approach in the analysis was to reconstruct "meanings in data by means of post hoc structuring, categorizing and clarification" (Blommaert, 2001, p. 2). The following are examples of the data which reflect four of the approaches in Ivanič's framework.

Key:

Italics: student text being read out by the teacher (sometimes with incorporating corrections)

(.): brief pause

[text]: inserted information

Skills

Janet (marking a post-work experience report):

I have done my work experience in Lees Garden Centre . . . oh great he's [student] spelled those words right as well that's good . . . the first day I was sweeping the floor putting the equipment in order (.) days after I went to a bridge for construction (.) days after (.) some days after I like it when I was chopping down a tree. It took me two days (.) ok he's forgotten his full-stop here.

Creativity

Anne (marking a short story):

at the end I've put a positive comment coz she's obviously worked really hard on it and it is effectively written and ironically because she is English as a second language it is she actually writes English in quite a poetic way erm—.

Process

Sally (marking a piece of character appreciation on Lysander in *Midsummer Night's Dream*):

She [student] starts off um *the character I have been studying is Lysander (.) Lysander is a wealthy Athenian gentleman (.)* there are spelling errors and gentleman is split into two words . . . her writing is quite repetitive (.) she's obviously not proof-reading.

Genre

Anne (marking a piece on the comparison of the parent figures in *Romeo and Juliet*): *I am the drudge and toil in your delight act two scene five (.) it means that she [the nurse] is willing to help Juliet in any way that will make her happy so she tries to take Juliet's side over the marriage to Paris but she [nurse] can't help changing her mind (.) Nurse says I think you are happier in this marriage in this second match (.)* And I've put in there that she needs to point out what part of the play it is in which this happens . . . classic tendency to stick a quote in and not give it any sort of context . . . erm, which isn't an EAL issue particularly it's just a lack of practice at essay writing.

The think-aloud protocols also suggested that the participant teachers were concerned with a number of other issues in student writing not covered by Ivanič's framework:

Student effort and achievement

Sally (marking a short story inspired by *The Signalman* text):

Um . . . no apostrophe (.) I think she [student] is trying to talk in the possessive but she doesn't get that at all (.) but she has worked very hard on this and I'm going to tell her that she is on the right lines and that she has used the topics effectively [students were given a topic list for guidance].

Second/additional language (EALness)

Anne (marking a short story):

it is late autumn and this morning is clear and white, snow came down last night although it is early morning but there already . . . there are some footmarks out of the window, erm, I've crossed out the but because she doesn't need that and I have put already between are and some and the between of and window but I have left footmarks which we would normally say footprints instead of because there's a limit to how much you can take on board at this stage in a language acquisition.

Success/assessment criteria

Margaret (marking an assessment task—parodying a poem entitled “Not My Business”)

you know not paying attention to sentence structures and so on she does that you know massive sentence at the end there with no division at all really . . . I think what she needs to focus on maybe is the success criteria [success criteria are lesson objectives].

Content

Sally (marking a character appreciation on Lysander in *Midsummer Night's Dream*):

She [student] is beginning to comment on Lysander's behavior (.) I am putting lots of arrows on the page because she has got a whole lot of information muddled up from one page to another (.) and I have commented that there is a reason for his love changing and she is using . . . the information at the wrong point.

Register

Anne (marking a piece on the comparison of the parent figures in *Romeo and Juliet*):

The parent figures in Romeo and Juliet are distinguished by each households (.) divided by two households that's another example of her using the dictionary and not getting quite the word she wants (.) I've just changed it . . . Juliet's parent figures are nur (.) the nurse who acts as her nanny (.) Lord Capulet who acts her father so I've put who is her father and Lady Capulet who acts again changing it again to is her mother.

Discussion

This small-scale exploratory study has shown that a qualitative research approach can help to illuminate the complex interiority of issues such as what counts as subject content and EAL development as understood and enacted by teachers *qua* assessors. With this approach to description and analysis it is possible to identify how ELLs' written work was being understood and assessed by particular groups of teachers. This kind of information can be very helpful when designing assessment criteria because it highlights the multifaceted nature of teacher *qua* rater judgments in specific curriculum domains, particularly for formative purposes. At the same time it can also point to issues in language assessment that would benefit from further research. For instance, some of the findings that emerged from the analysis were not easy to compartmentalize and label neatly. For example, when Anne remarked that “at the end I've put a positive comment coz she's obviously worked really hard on it and it is effectively written and ironically because she is English as a second language it is she actually writes English in quite a poetic way erm-,” she was

commenting on both EALness, and effort and achievement. This bundled reasoning seems to reflect professional experience and appreciation of the long-term and complex nature of EAL development. It also signals the possibility of apparently commonplace assessment criteria on quality, for example, effective use of language, being interpreted and enacted in ways that might combine recognition of achievement with an allowance for mitigating circumstances.

Another finding has pointed to a more intricate content-language issue. In the “register” judgment Anne was also concerned with content but perhaps in a slightly different sense. Here the teacher was concerned with the use of language to express context-appropriate meaning as much as the understanding of the content *per se*, the kind of language use that Halliday might (1999, p. 16) describe as constructing a text that would “construct a new situation,” using “*variation* in language, especially functional variation of the kind we refer to as ‘register’.” Here register can be taken to mean a set of meanings manifested through particular linguistic expressions that have legitimacy in a particular context (e.g., the use of specialist terminology in literature). At first glance, this would seem to be an issue of acceptable register. However, a closer look would suggest that the usage of “to act” in “Lord Capulet who *acts* as a father” was not deemed to be acceptable because the choice of the word “acts” did not fit in with the preferred way in which the story was meant to be understood (and expressed) in the context of studying a play (as understood by this teacher), which was itself a particular take on content. So, a judgment on linguistic usage may also turn out to be about content knowledge and vice versa. This is a subtle, but very important, issue for language assessment: judgments about appropriate language use have to take account of the notions of register, which encodes meaning with reference to authorial purpose, audience, and context.

Conclusion

The knotty issues discussed above are closely related to some of the central concerns in language assessment such as the meaning of an assessment grade or score, and the epistemological nature of the knowledge and skills being assessed. Studies using qualitative approaches can help us understand, *inter alia*, raters’ working assumptions as to what is to be assessed. For instance, in the study reported above, by exploring the participant teachers’ expressed responses and reasoning while marking student written assignments, it is possible to gain a close-up view of their priorities and concerns in assessment. Furthermore, the insights into the participant teachers’ responses and decisions can help substantiate a more general observation that the enactment of teacher assessment is mediated by a whole host of disciplinary and individual dispositions. This observation would provide the warrant for further teacher assessment research that takes situated local practices and participants’ meanings into account. Qualitative research approaches are well suited to addressing these issues of rater-mediated meaning and judgment in language assessment.

In general qualitative research approaches can be used to explore “how” questions to good effect. In language assessment there are many “how” questions, for example, how do examiners interpret the notion of “clarity of expression,” how do test takers make use of visual and written information in answering comprehension questions, how do students make use of formative feedback, and so on. Qualitative research can produce a grounded view of assessment issues by attending to participant meanings and actions, which can contribute to a fuller understanding of the phenomenon at hand (including the “why” question). Findings from qualitative research can help to throw light on both theoretical and practical issues, and to set the agenda for further research in language assessment.

Qualitative Research in Language Planning and Policy

MARK PAYNE

Language-Planning Research

A clear and all-encompassing definition of language planning (LP) remains elusive. A working definition used by this author, taken from Joshua Fishman, is: “the organized pursuit of solutions to language problems, typically at the national level” (Fishman, 1974, p. 79). This definition is included among Robert Cooper’s selected 13 definitions of a field that embraces both the societal focus in LP (status planning) and inherently linguistic matters (corpus planning), and ranges across a spectrum from national to local LP (Cooper, 1996). As Kaplan and Baldauf point out, LP is usually deliberate, governmentally driven, future orientated action designed to bring about changes in linguistic behavior (Kaplan & Baldauf, 1997). For example, a number of LP studies have influenced change in terms of national policies, such as Lo Bianco’s work on the Australian National Policy on Languages which sought to develop a nationally coordinated language policy (Lo Bianco, 1987) or Tuin and Westhoff’s work evaluating the foreign language capacity of the Dutch population in the Dutch National Action Programme (Tuin & Westhoff, 1997).

There are a number of ways of considering the field of language planning. It can be considered in terms of frameworks encompassing “status planning,” “corpus planning,” “language form,” and “language function” (Haugen, 1983); it can be viewed in terms of “prestige” hierarchies—the greater the prestige of the planner, the greater the likelihood of LP success (Haarmann, 1990); and it can be considered in terms of an “accounting scheme” centered on questions concerning “actors,” “behaviours,” “people,” “ends,” and so forth (Cooper, 1996, p. 98). More recently, one can also consider LP as a “linguistic eco-system” (Hornberger, 2002) in which a number of dependent forces are at work, such as language “death,” “survival,” “change,” and “revival” (Kaplan & Baldauf, 1997, p. 311). In LP and language ecology, “linguistic diversity” is seen as a “precondition for maintaining cultural and biological diversity . . . the ultimate aim . . . is to bring about an ecological balance which no longer requires management” (Mühlhäusler, 2000, p. 306). LP ecology calls for a paradigm shift in respect of the whole approach to LP, a shift away from seeing multilingualism as a “problem” to seeing linguistic diversity as an asset, though it is not clear from a qualitative research perspective how best to facilitate the shift. In research carried out in Australia into “An Ecological Approach to Language Revival,” for example, views were sought from teachers, students and community members into how indigenous students could be motivated to revive their languages (see Mühlhäusler, 2000, p. 343). This is a “bottom up” strategy to ensuring the maintenance and survival of minority languages in the face of the advance of “world” languages, particularly English.

Language-planning studies have tended to be grouped, broadly, within the “macro” and “micro” categories. “Macro” means studies at national, polity level that take the form of historiographies. They are largely descriptive, historical accounts of the language-planning “situation” in a polity, such as the work on language planning in Australia (Lo Bianco, 1987). They are essentially studies that do not draw upon primary research data.

Instead, they are often based upon secondary materials to describe a LP context, although the secondary sources used may themselves derive from empirical research, for example, statistics on languages spoken in a nationwide or regional census.

At the other end of the spectrum are micro language-planning studies. These are usually empirical studies based upon the collection and analysis of data within a school, classroom, or other small-scale language-planning context, extending perhaps up to a region, for example, London (Reid, Smith, & Morawska, 1985). Reid and his colleagues report on the Linguistic Minorities Project, which set out to work with local education authorities on ways of establishing the numbers and distribution of speakers of languages other than English in schools, to audit the teaching of minority languages and to study aspects of adult bilingualism (Reid et al., 1985). Such studies may be too small and intrinsically orientated to generalize from, and mainly of interest to those operating in similar contexts.

Although one would assume a between-category of mesolevel studies, most language-planning studies would appear to be either descriptive and “macro” or empirical-descriptive and “micro.” That said, it has been argued that there is a mesolevel (Kaplan & Baldauf, 1997). An example, again, would be the London study which incorporates the findings of a major sociolinguistic survey and focuses in particular on interviews with some 1,100 adults drawn from seven different linguistic minorities (Reid et al., 1985). The potential limitation here is that if the mesolevel study is too empirically focused it may slip into the micro category, but if it is too broad and nonempirical it takes on the appearance of a macro study.

Macrolevel Studies

These represent the “traditional” language-planning studies. Typically, they comprise of a full description of the linguistic “history” of the polity or country or place in question and how each of these responds to the language-planning complexities it faces. This could be a mapping of L1 language development over the years, the issues surrounding the introduction of an official version of a L1, or the reintroduction of an indigenous language. Examples of such studies include Mexico (Terborg, Landa, & Moore, 2006) and Cameroon (Kouega, 2007). In Terborg et al.’s monograph on the language situation in Mexico, they focused on three distinct challenges they considered relevant for Mexican language policy: the multilingual situation and shift conflict between Spanish and indigenous languages; foreign language teaching as a growing need in the education system; and Spanish as the language of 90 percent of all Mexican citizens which plays an important role as a symbol of national identity (Terborg et al., 2006, p. 415). In his monograph examining the language situation in Cameroon where there are speakers of some 25 languages, Kouega addresses issues of language use and spread, language policy and planning, and language maintenance and prospects (Kouega, 2007, p. 3).

There is a subsection to descriptive historiographies which focuses on what could be termed the “metalinguistic,” for example, the Francophone world which is not limited to one country (Salhi, 2002). Such studies could also be viewed from the perspective of post-colonial language-planning studies that consider issues around the use of indigenous languages as official languages to replace the imposed colonial languages such as French or English, for example the case of French in Zaire (Kamwangamalu, 1997). A further subgroup of historiographies combines the descriptive account of the “situation,” usually the language-planning “evolution” of a country, with the taking of a particular theoretical position. Examples include “language ecology” in terms of vernacular literacy in the Pacific (Crowley, 2000) and “language rights” in relation to a general defense of the rights of minority languages (May, 2003). There are also language-planning studies focused on one

particular dimension of language planning, usually from one of the language-planning dimensions, such as language death (Crystal, 2000), language amalgamation and standardization, for example, the standardization of the Basque language (Hualde & Zuazo, 2007), and language prestige, for example, in relation to revitalizing the Welsh language (Ager, 2005).

Micro Language Planning

A potential weakness of language planning, as a field, is that it appears to be dominated by the “prestigious” macrolevel studies (Haarmann, 1990). There is a great deal of language-planning and language-related research that is ongoing and micro-orientated but ultimately overlooked. However, over time and since the 1990s in particular, micro language planning as a credible and recognized area of language planning has gained ground. A major strength of microlevel language planning is that the research methods utilized may be more transparent and replicable. For example, in Payne’s (2006) study of foreign language planning in English secondary schools, teachers and pupils were sampled from across two case study schools. Data were collected by means of semi-structured interviews and pupil focus groups. Language lessons were observed conforming to a nonparticipatory strategy, and schools provided documentary data in the form of prospectuses and pupil statistics. A qualitative pupil-background language survey also comprised part of the data collection tools (Payne, 2006).

In Nekvapil and Nekula’s (2006) research into language management within a Czech subsidiary of a German electronics company, the methodology was made explicit. They carried out 11 interviews with local and foreign managers, conducted participant observations, collected and analyzed written documents, and recorded a conference call (Nekvapil & Nekula, 2006, p. 313). Marriott’s (2006) study “Micro Language Planning for Student Support in a Pharmacy Faculty” drew on empirical data including semi-structured interviews, a second main interview with a senior staff member, the collection of various written resources including the faculty’s website and program materials. Two planning meetings were audiotape-recorded. Interviews with students were planned for the subsequent stage of the research project (Marriott, 2006, p. 330). Kirkgöz’s (2007) study into language planning in Turkish primary schools was presented, partly, as an explicit case study. Focusing on a regional city and surrounding towns,

Fifty teachers of English—27 graduates of ELT departments, two non-ELT graduates (with BSc degrees in mathematics and biology), and 21 graduates of French or German departments, with teaching experience ranging from two to 16 years—participated in the study. (Kirkgöz, 2007, p. 183)

Research tools included questionnaires, interviews and observations. Butler (2007) investigated foreign language education at elementary schools in Japan, combining what appeared to be secondary and primary source data in a micro language-planning study: “My analyses are based on various governmental documents, schools’ reports, published academic papers, media reports, conference presentations, materials distributed at workshops for teachers, and my own field observations of selected schools” (Butler, 2007, p. 131). Loos (2007) conducted a language-planning case study of a Dutch parent company that runs a holiday center in Germany. In his investigation of language choices he interviewed the Dutch head of the human resources department, analyzed corporate documents (e.g., mission statement and information booklets) and transcripts of audio-recorded data of some 50 conversations between Dutch and German employees and guests (Loos, 2007).

Although these are all examples of micro language-planning studies, the language-planning boundaries can be seen to be blurred between the three realms of macro, meso, and micro. There are examples of what appear to be micro language-planning studies that may turn out to be more mesolevel or even macro-inclined. For more on this, see the “micro language planning” special edition of the journal *Current Issues in Language Planning*.

Methodologies in Language Planning

Macrolevel studies require, in essence, the skills of the linguistic-historian as the research is often based upon historical documents and secondary sources, including government documentation, census reports, and sociolinguistic statistics. The secondary sources will have been generated empirically prior to the macro study as primary source materials, but the macro language-planning researcher does not usually engage in first-hand empirical field research.

Microlevel studies on the other hand are usually based upon the generation of primary empirical data. This may include qualitative, quantitative, or both qualitative and quantitative questionnaires or surveys. This is particularly appropriate for sociolinguistic surveying of, for example, a village, school, or community. Amplifying beyond this will require sampling, for example, a couple of villages to generalize to a wider population. Depending upon the context, one-to-one interviewing may be required or focus groups of language speakers, perhaps extended to include in-depth life-history research. Within school-based research or other pedagogical environments, the observation of language classes and teachers may be appropriate, as in this author’s research into multilingual schools and their contributions to the linguistic communities in which they were situated (Payne, 2006). There may also be some scrutiny of documentation, for example, school, company or governmental documents, websites and statistics as in Butler’s investigation into the introduction of English into the Japanese elementary school system (Butler, 2007).

Limitations in Language-Planning Research

There are limitations to qualitative research in language planning. Macrolevel studies of linguistically complex polities provide a linguistic “overview,” a “broad-brush” handling of sometimes very complex linguistic situations. Microlevel studies have a more “hands-on” feel and give a deeper insight into a specific linguistic situation but, in turn, do little to illuminate the wider picture. There are then the mesolevel studies that fall between the two and may seem less rigorous in that they attempt to bridge the macro/micro divide and can attempt to generalize to a large population from a small sample. For example, in their sociolinguistic survey of the Dhimba language in northern Namibia to evaluate the feasibility for Bible translation, Cameron and Kunkel generalize from a sample of 203 to a population of over 30,000 (Cameron and Kunkel, 2002). There would appear to be more published macro- and microlevel studies respectively, than mesolevel studies, perhaps underlining this as a slightly problematic area.

A major methodological issue in terms of qualitative research in general, and something beyond the bounds of an entry in this encyclopedia, is the ongoing tension between practitioners of “hard” quantitative-based research and “soft” qualitative-based research. A positivist could argue that language-planning research premised on the collection of qualitative data is inherently limited. That said, according to Mann “The qualitative interview has a growing presence in applied linguistics” (Mann, 2011, p. 6). The preference, however implicit, for quantitative-based research does not appear to have been addressed

in the key LP journals of *Language Problems and Language Planning* and *Current Issues in Language Planning*.

Qualitative Research in Rhetoric and Stylistics

CHRISTINE M. TARDY

Style was considered one of the five canons of early classical rhetoric, accompanied by invention, arrangement, memory, and delivery. Early rhetorical views of style focused primarily on the selection of words chosen “to produce the desired effect” (Quintilian, 1921/1986, Vol. III, p. 195). Despite its centrality to classical rhetoric, style has been less prominent in contemporary rhetorical studies. However, as Butler (2007) has argued, it is still present “in its dispersed form . . . often not *called* style but instead . . . named something else within the field” (p. 5). In applied linguistics, stylistics became a popular area of study in the 1950s, associated with structural features of text. As in rhetorical studies, this research was somewhat distinct from literary stylistics, or the study of style in literary texts. Although the histories of rhetoric and style in applied linguistics differ somewhat from their histories and relationships in rhetorical studies, the study of style (and of rhetoric) can similarly be considered to be rather dispersed, found in numerous areas of inquiry and not always thought of as distinct subfields of applied linguistics. For instance, rhetoric and style may be studied within research on text, genre and discourse analysis, stance, voice, and critical discourse analysis.

Generally, the study of rhetoric and stylistics within applied linguistics is carried out to describe written texts and textual variations. Depending on the objects of inquiry, applied linguists may analyze rhetoric and style in an individual text, texts used by a discourse community, texts representative of a historical period, or texts representative of users who share a linguistic background. Although researchers draw on quantitative, qualitative, and mixed-method research approaches, this entry outlines some of the more common using qualitative research methods used in the study of rhetoric and stylistics.

The Study of Rhetoric and Style in Discourse and Genre

A concept with multiple definitions in applied linguistics research, *discourse* is important to the study of rhetoric and style. A traditional linguistic definition of discourse is simply a complete text—for instance, a letter, a speech, a memo, or a phone conversation. Discourse, in this case, is a unit of analysis to be contrasted with sentence-level analysis. A second definition of discourse, which is not incompatible with the first, is that of an “identity kit” or “ways of being in the world . . . forms of life which integrate words, acts, values, beliefs, attitudes, and social identities” (Gee, 1989, pp. 6–7). Discourse, then, is language in a social setting, and that social setting becomes critical in understanding the text itself. Discourse analysis may examine texts of a particular disciplinary community, such as academic discourse or chemistry discourse, or the texts of individuals. Qualitative discourse analysis often focuses on aspects of text organization—for instance, text coherence or cohesion—as they relate to underlying social or cultural aspects of the texts. Within applied linguistics, text organization has been studied as a way to understand the rhetorical elements of a text. The ways in which a text is structured and arranged reveal assumptions about the reader–writer relationship and the preferred sequences for expressing logic, argument, persuasion, or all of these elements.

2 QUALITATIVE RESEARCH IN RHETORIC AND STYLISTICS

Text coherence describes how ideas are linked within a text to create meaning. Research in coherence often focuses on a text's propositional units and the sequencing of those units. One common approach to researching coherence is topical structure analysis (Lautamatti, 1978), which examines topic development through the arrangement of sentences. Other schemes for analyzing discourse structure in terms of coherence include problem–solution structures and given–new structures. The study of text cohesion, on the other hand, examines the links among sentences that unify an entire unit of discourse. Major types of cohesion include reference, substitution, ellipsis, conjunction, and lexical cohesion (Halliday & Hasan, 1976). The study of cohesive devices has been used to study student writing as well as published technical and academic writing.

Additional frameworks of analysis, beyond those of cohesion and coherence, exist. For instance, Clyne (1987) offers an analytical framework for mapping discourse organization in terms of linearity, hierarchy, symmetry, and continuity. Researchers adopting this framework examine each dimension within a text and describe the features as if on a continuum—for example, linear, slightly digressive, or very digressive (Farrell, 1997). In sum, researchers of discourse may adapt or develop frameworks to aid in the analysis of rhetoric and style as they relate to underlying structures that communicate meaning within whole textual units intended for specific audiences.

Genres may be thought of as typified or conventionalized forms of discourse used to carry out repeated actions. Complaint letters, recipes, warning labels, and academic articles may all be considered genres. Genres have been described as primarily rhetorical forms, meaning that generic classification is based primarily on purpose and audience. This shared rhetorical aim tends to result in a preferred form that becomes conventionalized and recognizable over time. While rhetoric plays a defining role in genre, style is recognizable in the genre's form. In a seminal essay, Bakhtin (1986) describes style as inseparable from genre, arguing that style is linked to the individual speaker/writer, the thematic content of the genre, the relation between the speaker/writer and audience, and historical period. Because both rhetoric and style are crucial elements of genre, they are often studied as part of genre analysis.

One of the more common qualitative methods of genre analysis is known as move structure analysis (Swales, 1981). In this method, the researcher examines a collection (or corpus) of texts representative of the genre and seeks to identify common parts of the genre as they relate to the rhetorical goals that each part carries out. For instance, based on published research articles from multiple disciplines, Swales identified four rhetorical moves commonly found in research article introductions:

- establishing the field;
- summarizing previous research;
- preparing for present research;
- introducing present research.

Importantly, rhetorical move analysis serves as a method for identifying how specific communities carry out their goals within a text-genre. The method is therefore useful not only for researchers, who have used it to reach insights into specific discourse communities, but also for student writers, for whom a greater understanding of the rhetorical and social influences on written form can play an important part in learning.

The study of discourse and genre across cultural or linguistic groups has become an important area of inquiry in applied linguistics, referred to as contrastive rhetoric or intercultural rhetoric. Research in this area compares rhetorical, stylistic, or both patterns across writers of different first language (L1) backgrounds (e.g., Duszak, 1997; Connor, Nagelhout, & Rozycki, 2008), sometimes comparing texts written in different languages (the L1 of the

writer) and other times comparing texts written in one language by writers with different native languages.

Stylistic and Rhetorical Devices

In addition to studying organizational aspects of discourse and genre, researchers may also examine texts at a more micro level. On this level, the study of rhetoric and style is vast and encompasses a wide range of features. Traditional categories of linguistic text analysis, rhetorical analysis, and stylistic analysis include grammar, vocabulary, metaphor, and a broad range of rhetorical stylistic devices. While quantitative studies of rhetorical and stylistic devices tend to focus on frequency counts, qualitative research observes general patterns of use. Researchers also must consider the extent to which rhetorical and stylistic forms balance individual choice with the rhetorical constraints of genre.

Grammar

Grammatical choices—such as the use of passive voice or sentence length—give rise to style and rhetoric within the constraints of genre. For instance, the use of sentence fragments which omit a subject (e.g., “Led a team of engineers in research and development”) is common and preferred in a résumé but would likely be seen as unusual, if not problematic, in a formal academic paper. Grammatical patterns that relate to genre and the relationship created between writers and readers are commonly studied—passive structures, imperatives, or verb tense, for example, can all create particular stylistic effects while serving rhetorical purposes for writers.

Vocabulary

Lexical choices are perhaps one of the most obvious stylistic features of texts. When writers have choices among synonyms, they select words that fit—or flout—genre and audience expectations while also perhaps considering personal preference. While the word “generate” may be preferred in a formal text, “make” may be preferable in a less formal text. Lexical choices may also signal identity or social alliances. For instance, the preference of many lesbian, gay, bisexual, or transgendered people to self-identify as “queer” signals a particular identity and political stance, yet the same word can be used in other contexts as a derogatory epithet.

Metaphor

Metaphor is a common category of investigating style through a cognitive approach. Metaphor allows us to transfer mental constructs. For instance, the metaphoric use of *lifting* in the following sentence from the *New York Times* serves to situate a ban on off-shore drilling as heavy and constraining: “The oil industry, its supporters in Congress and Gulf Coast officials have called for swiftly lifting the moratorium, saying that the ban was causing severe economic hardship.” As Simpson (2004) notes, part of the effectiveness of metaphor lies in its novelty, so writers—writing in particular genres—may try to avoid use of overly familiar metaphors.

Other Stylistic Devices

Although grammatical, lexical, and metaphoric features are perhaps the most common rhetorical stylistic devices examined in applied linguistics, a broad range of other features may be considered in a stylistic analysis of text. For instance, parallelism (the repetition

4 QUALITATIVE RESEARCH IN RHETORIC AND STYLISTICS

of a grammatical structure), alliteration (the repetition of consonant sounds), anaphora (the repetition of lexical phrases that begin a sentence or phrase), and rhetorical questions all represent features that may be used for rhetorical or persuasive purposes in particular genres.

Visual Rhetoric

While traditionally the study of text in applied linguistics concentrated on linguistic features, the rise of new media and modes of communication has led to an increased focus on visual elements. Choices in font type and size, color, images, and document design all create stylistic and rhetorical effects. Fahnestock (2003) explores how both verbal and visual parallelism are used persuasively in scientific texts. For instance, Fahnestock illustrates how visual parallelism—the juxtaposition of three or more similarly sized images in a row—aids readers in drawing inferences from the images and therefore constitutes an argument. She draws on examples of texts in evolutionary science and entomology to illustrate how visual images can serve as persuasive devices. Looking at the relationship between disciplinary preference and visuals, Rowley-Jolivet (2004) has focused on the visuals used in conference presentations slides, examining how visuals create cohesion and express rhetorical claims. Comparing slides across three scientific disciplines, she links visual variations to disciplinary methodologies and epistemologies.

Writer Stance

One aspect of rhetoric and style that has received a great deal of attention has been that of writer stance, also described as rhetorical and linguistic resources which allow writers to express beliefs and judgments. These strategies “explicitly announce the writer and negotiate a rhetorical identity” (Hyland, 2002, p. 1093). First-person pronouns (*I, me, my, we, us, our*) provide one very overt tool for writers to express stance and commitment to their ideas. The use of these pronouns may be shaped by disciplinary preferences as well as by a writer’s status as a relative novice or expert or even by the epistemological paradigms that a writer adopts within a discipline. The use (or non-use) of *I* may lead writers to appear more or less confident in and committed to their claims, and perhaps more or less self-reflexive in relationship to their research; the use of inclusive *we*, especially in single-authored texts, may signal an author’s solidarity with disciplinary members, representing what Hewings and Coffin (2007) refer to as “consensual voice” (p. 126). While some studies have taken a quantitative approach to counting the frequency of occurrences of features like first-person pronouns, qualitative studies may instead identify general patterns of use.

Voice

Another area of discourse analysis which considers style and rhetoric is the study of authorial voice. The term *voice* is somewhat ambiguous, as it has been variously referred to as an individual expression of personal style and as a social construction of the author—that is, an image of the author constructed jointly by the writer and readers. One common socially oriented definition of voice, for example, describes it as “the amalgamative effect of the use of discursive and nondiscursive features that language users [appropriate], deliberately or otherwise, from socially available yet ever-changing repertoires” (Matsuda, 2001, p. 40). Matsuda (2001) specifically distinguishes voice and style by describing style as a factor that contributes to voice. Researchers studying voice from this perspective

examine those discursive (text-internal) and nondiscursive (text-external) features that make a text unique, from the perspective of the text's reader(s). For instance, in his study of the distinctive features used by a Japanese Web diarist, Matsuda (2001) found that the writer made use of the *katakana* alphabet, self-referential pronouns, and sentence-final particles in unexpected or unconventional ways. Turning to the perspective of how readers construct a writer's voice, Matsuda and Tardy (2007) adopted a mock blind peer review case study, in which two readers read and commented on an anonymous manuscript. They found that the readers tended to construct a writer's voice through the extent to which the writing conformed to or deviated from generic expectations. For instance, some deviations led the readers to construct the writer as a relative novice to the genre and discourse community, while certain conformities suggested to the readers that the writer was "earnest" and had "read a good deal."

Rhetoric, Style, and Ideology

While much research of rhetoric and style in applied linguistics aims to describe texts, critical discourse analysis (CDA) draws on these constructs as a means of critiquing texts by identifying underlying ideologies. Van Dijk (1998) defines ideologies as

representations of who we are, what we stand for, what our values are, and what our relationships are with other groups, in particular our enemies or opponents, that is, those who oppose what we stand for, threaten our interests and prevent us from equal access to social resources and human rights. (p. 69)

Ideologies are realized and expressed in texts through discourse structures, including topics, discourse schemas, style, and rhetoric; therefore, the study of style and rhetoric plays an important role in CDA. Through close readings of public discourse such as political speeches, parliamentary debates, or newspaper editorials, CDA researchers demonstrate how stylistic and rhetorical devices (such as those described previously) represent social structures in ways that serve the interests of some while marginalizing others. For example, in a study of anti-immigration discourse in 107 texts published in a California newspaper, Ana (1999) identifies a dominant use of animal metaphors used to represent immigrants. Through the use of numerous examples culled from a wide range of texts, CDA researchers are able to identify patterns of text that serve to form mental representations that readers may not even be overtly aware of.

Qualitative Research on Bilingualism and Multilingualism

OFELIA GARCÍA

Introduction

In the 21st century, the study of bilingualism and multilingualism has come to the forefront. With globalization and the flux in movement of people, goods, and information, the world's multilingualism and the plurilingual practices of its people have been made visible. Our understandings of bilingualism have shifted from those derived from monolingual perspectives, with bilingualism seen as simply double monolingualism (Grosjean, 1982). Instead, in the 21st century, bilingual practices are valued for their complexity, interdependence, and dynamism (García, 2009). The original "advances" in the study of bilingualism and multilingualism mostly used positivistic models of quantitative research methodology (see, for example, Joshua A. Fishman's approaches to the study of the sociology of language, William Labov's approaches to variationist sociolinguistics, and experimental psycholinguistic approaches to second language acquisition). Today, however, qualitative research methodology is increasingly used to study the complexity of the interdependent systems of bilinguals and plurilinguals, and the dynamism of bilingual practices in society.

The questioning of 20th-century models of bilingualism is also a product of epistemological changes about language and literacy practices, as well as new understandings of research processes. The development of critical sociolinguistic studies of bilingualism and the emergence of new literacy studies have made evident that language and literacy practices are shaped by local, social, and economic conditions, and that language and literacy practices contribute to reproduction of asymmetrical relations of power. This reflexive and sociocultural turn in epistemologies has also resulted in increased use of qualitative methodologies in studying bilingualism.

There are many traditions of qualitative research, and all have been used in the study of bilingualism and multilingualism. We review some of them below.

Qualitative Research on Bilingualism and Multilingualism

Although qualitative research is eclectic in its methods, we outline here the methods most often used in studying bilingualism. *Ethnography* is probably the qualitative method most used in the study of bilingualism and multilingualism. Ethnographers primarily learn by experiencing, and ethnography focuses specifically on the beliefs, values, and attitudes that shape the behavior of a particular group of people. Ethnographies of multilingualism show how language practices matter to people in their own terms. Examples of important ethnographies of multilingualism and sociolinguistic use in the construction of social difference and social inequality are Zentella's (1997) study of bilingualism, which traces bilingual practices of families in a New York neighborhood, Heller's (2006) work on linguistic minorities and modernity in Toronto, Canada, and Martín-Rojó's (2010) study of inequalities in multilingual classrooms in Madrid, Spain. Bartlett and García's (2011) ethnography of a bilingual high school for Latino immigrants in NYC goes beyond a

sociolinguistic ethnography to include a study of language and education policies and the political economy surrounding schooling of immigrant youth. Focusing on language as social practice, “linguistic ethnographies” (Rampton et al., 2004) provide close analysis of situated language use that reveals the indexing of the social, political, and historical positioning of its speakers. A study combining both ethnographies of multilingualism and linguistic ethnographies is Blackledge and Creese’s (2010) work on complementary schools in the UK.

Often, qualitative researchers studying bilingualism use a *case-study* methodology where the unit of analysis is bounded and the case is situated in local action. These are ethnographic case studies, meaning that there is intensive description and analysis of a phenomenon, but they are often of shorter duration than true ethnographies. Cases are frequently used to study the social dynamics of language use of bilinguals, that is, the speech events—who is involved, what is the purpose, what are the communication channels used, the topic of talk, the mood of the encounter, and the interactive routines.

Discourse analysis is another qualitative research method often used to study bilingualism and multilingualism. Unlike ethnography, discourse analysis enables researchers to study the structure of discursive practices itself—whether spoken, written or nonverbal—and often within interactions and in interrelated ways. Frequently discourse analysis functions jointly with ethnographic methods to identify semiotic and linguistic issues that are then explained by ethnography. This is the case in Elise Du Bord’s (2008) ethnographic analysis of discursive practices at a day labor center and Pennington’s (1999) analysis of bilingual classroom discourse at a high school in Hong Kong. Because of the linguistic hierarchies that are evident in the study of bilingualism and multilingualism, these topics are often approached through critical discourse analysis (CDA). CDA has been a way of explicitly connecting language ideologies and language practices to relationships of power. It makes connections between language and broader social theory, paying attention to power and ideology, and is an important research method to study the “othering” of immigrant language minorities.

Another important qualitative research method in the study of bilingualism and multilingualism is *narrative analysis*, which uses first-person accounts told in story form as data. Narrative analysis has been extensively used to study language practices and to collect natural speech data. Sometimes the narrative analysis is conducted on *fictional narratives*, that is, stories about fictional events, which are elicited with nonverbal prompts such as pictures, cartoons, or videos. *Frog, Where Are You?* is a picture book that has been frequently used for elicitation of narratives with bilingual and multilingual children. These stories allow researchers to explore the structural and narrative competence of bilingual individuals.

At other times, narrative analysis includes *biographies* or *life narratives*. These personal experience narratives can be elicited in a number of ways. Sometimes bilingual participants are asked to tell particular kinds of stories or to respond to specific questions. Sometimes, participants are given key events or key words to which to react, sometimes, narratives are spontaneous. In whichever way narratives are elicited, however, narrative analysis always takes the perspective of the teller, rather than that of society. Yet another variant of narrative analysis is the *linguistic autobiography*, often used to study the language practices of bilinguals, as well as the acquisition, loss, or maintenance and development of different bilingual practices.

A challenge of narrative analysis is having bilingual participants who can produce the narratives. A way of facilitating a narrative is to confront participants with provocative statements, images, or videos that personally engage them. Participants often produce longer narratives when recounting a critical incident. The rapport between researcher and participants is an essential element in conducting narrative analysis, since the analysis relies on the comfort level of participants.

Qualitative researchers of bilingualism and multilingualism, especially those interested in language policy, and specifically in bilingual/multilingual policy, most often conduct *historical or document analysis*. Most of the time, qualitative researchers collect documents, which are then subjected to interpretive policy analysis (Yanow, 2000). Interpretive policy analysis goes beyond the traditional analytical approaches. Policy is not examined for what it says and what it does; instead, interpretive policy analysis includes local meanings and the multiple reading of the policies by various stakeholders as interpretive communities. It includes the analysis of the language policies as texts as well as the enactment of the policies, which can also be "read." The way in which researchers conduct interpretive policy analysis is related to reader-response theory in literary analysis, but often discourse analysis is also used.

Sometimes document analysis is conducted on bilingual books or authors, and on song lyrics that use fluid language practices, especially hip-hop. Bilingual newspapers and bilingual advertisements also offer plenty of rich data that can be subjected to analysis. A recent extension of document analysis methods is that used in the field that has become known as linguistic landscape studies. Linguistic landscape studies focus on how multiple languages are represented and displayed in public spaces and places, and especially in multilingual signage.

A growing number of qualitative studies of bilingual and multilingual use focus on online literacy practices on the Internet. Interactions in forum sites, as well as chatrooms, are studied as ways of looking at multimodal multiliteracies. These new technologies are extending the ways in which we understand traditional document analysis.

In summary, qualitative methods of studying bilingualism and multilingualism conceive of knowledge as reuniting epistemology and hermeneutics. By doing so, qualitative methodology goes beyond a false distinction that has served to subalternize the kinds of "border" knowledge that bilinguals and multilinguals often have, and that distinguish them from monolinguals (Mignolo, 2000).

Data Collection and Analysis

In conducting research on bilingualism and multilingualism attention needs to be paid to the language practices in the events being studied. Plurilingual researchers are needed for multilingual encounters. But even when the researchers and the participants have language practices in common, decisions have to be made about how the discourse is structured and what discursive practices to use. It may be best to let the participants themselves choose the language practices of interaction with the researcher, if at all possible.

Researchers interested in studying bilingualism and multilingualism often record individuals or groups of speakers as they perform their identities. Sometimes this is done through observations, whereas other times it is done through interviews. Often both observations and interviews are used. Recording is done through audio or video recordings so as to gain understandings of verbal and nonverbal communication. Some qualitative researchers are interested in natural speech data, whereas others are interested in specific language forms, and yet others want to find out the attitudes and beliefs of speakers. Recording makes it possible to create audio and video databases that then allow for repeated playback and listening/observation, as well as for other researchers to review the data.

When recording is not possible, detailed field notes become important in qualitative research. Participant diaries or language diaries are often used to supplement the information. For example, a participant who keeps a language diary will be able to note the frequency and patterns of data that have emerged in recordings. In addition, diaries enable researchers to check self-reports of participants.

Observations and interviews (whether individual or group) can be analyzed for specific details of talk or for content. If the interest is in specific details of bilingual speech, transcriptions are most important, although it is possible not to transcribe an entire interview, but just specific segments. It is recommended that different types of data (for example, interview data and observation data) be used in combination. It is also possible to combine face-to-face individual interviews with other types of interviews, as well as with focus groups. The exchange of ideas that occurs in focus groups may provide substantive information, as well as ways of talking that are different from when conducting individual interviews.

Observations of bilingual encounters can be free or a frame can be chosen beforehand and included in an observation protocol. This is especially important when working with a team of researchers. Interviews are always unstructured, although developing an appropriate interview/narrative prompt or an interview guide ensures that participants are responding to the same stimuli.

In analyzing qualitative data, it is possible to use software to systematize the unstructured data into categories and themes. But researchers working with this software and multilingual data will have to be cautious that codes assigned pick up the multilingualism of the data.

Qualitative data collection and analysis, especially on bilingualism and multilingualism, is especially challenging. On the one hand, data is not simply reduced to numbers, but includes an enormous amount of textual data in many forms—verbal, images, sounds, gestures—often interconnected. On the other hand, it includes multiple discursive and semiotic practices, the product of multilingualism and multiculturalism. At the same time, its analysis requires researchers who are deeply connected to the meaning-making linguistic and cultural practices that are evident in the data. Without this connection, it is possible for the unstructured data of qualitative research methodology to remain distant and disconnected, a cacophony of pieces of data that do not in any way illuminate the sense making of multilingual encounters and plurilingual citizens.

Qualitative Research on Information and Communication Technology

PAIGE WARE AND MARK WARSCHAUER

Qualitative research on information and communication technology (ICT) covers a wide terrain, from studies examining online text comprehension (Coiro & Dobler, 2007) to multi-year ethnographic accounts of participation in online gaming (Thorne, Black, & Sykes, 2009) and fan fiction communities (Black, 2008). Rapid proliferation of ICT has fostered quantitative studies about relationships among technology use, Internet access, literacy learning, socioeconomic status, geographic location, and education level. However, as Hargittai (2010) shows in her quantitative analysis of such associations among young adults, researchers still have much to learn about patterns and contextualized differences within these larger trends. Qualitative research provides the necessary descriptive work to account for context and to explore theoretical frames for understanding the intersection of technology, language, and literacy. This entry begins with an overview of current qualitative research on ICT use as organized into classroom-, community-, and network-based studies, followed by a discussion of the methodological challenges posed in ICT research. Finally, new demands on qualitative researchers will be explored.

Current Areas of Inquiry in ICT Research

Qualitative research on ICT use generally takes place in classrooms, in community contexts, or with diverse online participants that are not centralized in one location (for syntheses, see Suggested Readings).

Classroom-Based Studies

Many classroom-based studies in elementary and secondary schools focus on particular sets of skills that have been theorized as potentially important when exploring new technologies, such as the skills needed for online navigation and reading (Coiro & Dobler, 2007; Lawless, Schrader, & Mayall, 2007) or for searching and processing information from the Internet (Kuiper, Volman, & Terwel, 2005). In a multi-case study of 10 culturally and linguistically diverse kindergarten to 12th grade (K-12) schools across the US that provided laptop computers for use by every student in one or more grade levels, Warschauer (2006) examined multiple layers of skills, roles, and system-wide change. His study, which combined classroom observations; interviews with teachers, administrators, students, and parents; and analysis of student- and teacher-produced documents, concluded that literacy processes, resources, and products changed markedly in laptop classes, resulting in more meaningful and student-centered classroom practices.

In postsecondary classroom contexts, foreign language and second language researchers and educators have used interviews, observations, discourse analysis, and text analysis to examine online communication in synchronous and asynchronous environments, with an emphasis on either language use or cultural understanding. While these studies differ in their choice of learner outcomes, task design, mode of communication, learner populations,

target languages, and sample size (from single individuals to cohorts of classroom learners), they share interests in understanding how the nature of language teaching and learning has changed in multilingual and multimodal environments, and in the degree to which globalized notions of language, culture, and context intersect with local constraints of institutions and ideologies in new online realms (see, e.g., Warschauer, 1999).

Finally, virtual environments have been studied for their learning potential in postsecondary classes. A recent review by Thorne et al. (2009) discusses how researchers examine various linguistic and cultural aspects of virtual environments using task and ethnographic observations, interviews, participant mapping, questionnaires, and journals. For example, they describe Sykes's dissertation work deploying observations, surveys, interviews, and pre- and post-test data to investigate how learners developed Spanish pragmatics through game play in a specially designed environment called Croquelandia. Her study found both perceived and real positive outcomes in learners' abilities to make requests and apologies.

Community-Based Studies

Community-based programs are typically less tied to formal learning outcomes and have emphasized learner identity and agency (e.g., Hull & Nelson, 2005; Hull & Katz, 2006) and the potential for certain digital literacy practices such as gaming to offer new avenues for digital literacy mastery and expertise (e.g., Steinkuehler & King, 2009).

Some of the most extensive research on community-based literacy and technology projects draws from a multiyear digital storytelling community project in a low-income urban California community (Hull & Nelson, 2005; Hull & Katz, 2006). Digital Underground Storytelling for Youth (DUSTY) was a community-university collaboration for local youth and adults to write and share multimedia stories in a supportive, constructive environment. Data sources included an archive of hundreds of digital stories, one-on-one and focal group interviews, undergraduate student and researcher field notes and case studies, pre- and post-skills inventories, questionnaires, and digitally recorded interactions around computers. Case studies from the project have provided a semiotic analysis of multimodal expressive genres (Hull & Nelson, 2005) and illustrated the potential of digital storytelling to shape participants' learning trajectories and literacy identities (Hull & Katz, 2006).

In contrast, Steinkuehler and King's (2009) community-based research has focused on cognition, motivation, and mastery learning. They developed an after-school program in massively multiplayer online (MMO) gaming for adolescent boys, in which the researchers document through participant observation, multimodal field notes, participant artifacts, interviews, videotaped interactions, and pre- and posttest comparisons of student performance how motivation, apprenticeship, and mastery learning develop and how the digital skills acquired through gaming might plausibly transfer to academic work.

Network-Based Studies

Network-based studies are conducted outside of bricks-and-mortar contexts (for research reviews, see Steinkuehler, Black, & Clinton, 2005, or Thorne et al., 2009) and examine issues ranging from the construction of social identities through instant messaging and multilingual communities online (Lam, 2009), to English-language development in fan fiction communities (Black, 2008) and the social and cognitive demands of MMO virtual gaming worlds (Steinkuehler, 2008). Participation in these online "affinity spaces" (Gee, 2004, p. 85) is typically defined by shared interests, an inclusive environment of novices and experts, and a mixture of individual and distributed knowledge.

In her ethnographic work, Lam (2009) has used individual and focal group interviews, screen recordings of digital literacy practices, online transcripts, observations, and surveys to document the mutually constitutive identity formation that occurs when adolescent

language learners participate in multilingual, transcultural online communities. Lam's work precedes and complements Black's (2008) three-year ethnographic study of six English-language learners participating in international fan fiction communities. As a participant observer, Black drew on a database of her participants' fan fiction writing and the reviews, participants' Web sites, and interviews conducted via instant messaging and e-mail. She found that her focal participants became avid writers by contributing a large body of original and often multilingual writing and by providing peer feedback to others on the site.

Research studies by Lam (2009) and Black (2008) reflect larger trends common to ethnographic studies of language and literacy practices on social networks. First, these studies involve a large investment of participant observation time to gain an insider, or emic, perspective. Second, they typically move beyond concerns of language or literacy development in a conventional sense to instead focus on documenting the roles and functions of language as it is used in transcultural, transnational online settings. Finally, to accomplish this, such studies typically draw on and contribute to theoretical lenses that view literacy as multimodal and situated within larger institutional, social, and cultural discourses.

Considerations of Qualitative Methods in ICT Settings

Conventional qualitative data collection methods are commonly used in qualitative research on ICT, such as conducting interviews and observations, collecting field notes, amassing relevant documents, and disseminating surveys (Miles & Huberman, 1994). These methods, however, are based on face-to-face, physical settings and require new considerations in many ICT settings. Researchers committed to crossing, as Leander (2008) suggests, the "online/offline, virtual world/real world, and cyberspace/physical space binaries" (p. 37), must retool and repurpose these methods of data collection and analysis in order to capture interactions and information flows across digital as well as physical spaces.

Recent research highlights ways to consider the interaction between the *products* of digital communication (interaction transcripts, Weblog archives, videos, Web sites, etc.) and the *processes* of the production and consumption cycle (access, orientation, affiliation, collaboration, interactivity, etc.). In addition to interviews and surveys of students and teachers, and observational field notes, many studies use written data, such as downloaded and archived transcripts of synchronous chats or asynchronous blogs and discussion boards, to document and uncover patterns in language use and development.

In research that incorporates other visual and aural modes, such as digital videos, online gaming, social networking, and Internet search activity, researchers often use screen recording software to track participants' Internet activities as they engage in different online activities. Researchers of social networking and gaming activities gather transcripts and screenshots of the social interaction and activity that take place in various forums (online gaming, fan fiction, multilingual networking, instant messaging, listservs, chatrooms, and blogs) and triangulate this interactional information with other online activity, including participants' personal Web sites and updates, player manuals, and online guidebooks (see Black, 2008; Leander, 2008; Lam, 2009; Steinkuehler & King, 2009).

Examining the *processes* of ICT activity also presents new challenges in qualitative research. In ICT studies that are not bound to a physical location, the notion of "local groundedness" (Miles & Huberman, 1994, p. 10) is complicated when the local is no longer dictated by physical spaces. Traditionally, understanding an emic perspective is gleaned through individual and focal group interviews and prolonged periods of site observations. When participants are distally located in social networking studies of MMO games

(Steinkuehler, 2008) and fan fiction (Black, 2008), or in institution-based studies of international communication (Belz & Müller-Hartmann, 2003; Ware & O'Dowd, 2008), researchers seek other ways to understand the perspectives and contexts of participants across wide geographic areas. To this end, interviews have been conducted utilizing e-mail, listservs, instant messaging, and video conferencing. Kendall (2008) warns, however, that nonverbal communication and feedback, interactional rapport, and a natural conversational flow can all be compromised without face-to-face contact.

Other ICT research focuses less on the social aspects and more on underlying cognitive factors associated with new technologies. Tools such as think-aloud and retrospective protocols and directed graphs have been adapted to understand how individuals make sense of particular online activities and to locate potential patterns in such sense-making (see Steinkuehler et al., 2005).

New Demands in Qualitative Research in ICT

Qualitative methods require some modification in order to capture the full range of ICT activities across the many virtual and physical contexts highlighted here, but other new demands are placed on researchers in this area. Documenting ICT activity within and across multiple contexts of home, school, and Internet (Miller & Slater, 2000; Leander, 2008; Lam, 2009) raises issues related to time and expertise as well as to unprecedented aspects of ethics and privacy (Steinkuehler et al., 2005; Leander, 2008).

First, qualitative research in ICT requires a relatively strong degree of familiarity with research methods and language use as well as with the particular technology of focus. This added layer of expertise can require considerable time to obtain, even as the choice of technologies continues to expand. And yet, as Steinkuehler et al. (2005) warned, "your own technical literacy in the digital space of interest tightly constrains what you can observe and therefore are in a position to theorize" (p. 96). Achieving breadth of expertise requires time on the part of the individual researcher or a shift toward conducting research in teams of distributed expertise.

Examples of collaborative research are provided in studies of online intercultural communication, in which teachers and researchers in each participating country conduct interviews and observations (cf. Belz & Müller-Hartmann, 2003; Ware & O'Dowd, 2008); in ethnographic work, in which researchers conduct home and school visits on multiple focal participants using the same theoretical lens and framing questions (Leander, 2008); or in comparative ethnographies, in which researchers canvass larger sections of the population through interviews and surveys while also collecting online data (Miller & Slater, 2000). These three examples highlight different ways in which research teams have addressed the practical issues of obtaining representation and coverage of an area of inquiry when the information needed is not conveniently located in one physical space.

Issues related to ethics and privacy also pose new challenges. In strictly online contexts, a researcher often has only the participant's word for his or her identity. In Black's (2008) research on fan fiction, identity was verified through triangulating information gleaned from self-reports, consistencies in participants' presence on the Web across multiple online contexts, and signed written consent. Ethical issues arise around the extent to which any of the participants of the ICT activity who are not the focus of the research can or should be made aware of the study. Lam (2009) addressed this issue by having her focal participant inform her online contacts prior to recording any instant messaging sessions.

Leander (2008) documents further challenges associated with research online, including difficulties in obtaining human subjects' permission, in recruiting participants, and in maintaining the privacy of what he calls "incidental data" (p. 59), that is, interactions and activities that are documented by the researcher but which the participants might wish to

exclude from viewing by others. Leander therefore employed a series of precautionary measures, including obtaining consent through Web-based forms, allowing participants to view and delete sections of the transcripts of files before releasing them to the researchers, and developing longer-term, collaborative relationships with the participants.

Conclusion

Qualitative research is ideal for exploring new realms in which there is little previous research and thus difficulties in generating hypotheses. With technology-mediated interaction developing and changing so rapidly, qualitative research has been well suited to exploring the language and literacy practices that occur in such realms, and will likely continue to be in the future.

Qualitative Sociolinguistics Research

JULIET LANGMAN AND PETER SAYER

Qualitative sociolinguistics research (QSR) is an approach to sociolinguistic research that focuses on the ways in which people in communities use language to accomplish things in the world, and how they represent themselves to the world. QSR, in contrast to quantitative research, seeks to examine and explain the richness of language variation in particular contexts with an overall aim of understanding the relationships between language and the social world. As such, qualitative sociolinguistics research employs a range of data-collection and data-analysis tools and approaches that can lead to a “socially sophisticated approach to language variation that systematically takes into account the behaviors and motivations of speakers” (Chambers, 2003, p. 8).

Given the increasing complexity and interconnectedness of today’s world, QSR places central importance on understanding how differences in language both reflect and help to create differences in—on the one hand—how individuals and groups use language, and—on the other hand—how they are evaluated or judged as a result of their language use by others. While QSR describes a particular research orientation, researchers in this area employ several related research methods, in particular ethnographic methods and discourse analytic approaches.

Formulating Qualitative Sociolinguistic Research

Qualitative research by its name implies a concern for the details and particularities of a research problem; in the case of sociolinguistic research, this entails a focus on the details and particularities of language use in context (Ramanathan & Atkinson, 1999). Key to any qualitative sociolinguistics research is a definition of language use and a definition of context. The concept of context can be understood in terms of a set of concentric circles of influence on a given language situation in which language is used for particular communicative functions. Beginning with the most local context, sociolinguists are interested in understanding how the moment-to-moment actions of one speaker in a particular time and place affect the form of what is said, the meaning that is intended, and the manner in which it is interpreted by others in the interaction. Social interactions are also framed by relationships among group members, which approaches such as social network analysis (Milroy, 1987) and communities of practice (Eckert & McConnell-Ginet, 1992) take as their starting point. Discerning and explaining differences in how language use both creates and reflects social groupings lies at the heart of sociolinguistics research. Through careful in-depth analyses of a wide range of situations and associated language use, a picture of how language works to structure society, and human relations within it, can be drawn.

QSR, like all other forms of research, starts with a particular question or issue. Consonant with the field of sociolinguistics, the research question or issue typically focuses on a social concern, for example understanding how individuals argue and misunderstandings occur, understanding how children and adults acquire the tools to communicate in their own or in new communities, or understanding how particular contexts serve to support or hinder individuals with different language practices when it comes to achieving their

2 QUALITATIVE SOCIOLINGUISTICS RESEARCH

communicative and social goals. Topics or areas of concern in the last 20 years have included: differences in interaction both within groups and between members of groups based on social class, race, ethnicity, and gender; bilingualism and code switching; language planning and language policies; and educational and workplace practices. In each of these cases, research also often attempts to understand and explain inequality in terms of how individuals' language is evaluated.

Traditions in Qualitative Sociolinguistics Research

The use of qualitative methods in sociolinguistics generally belongs to one of three related approaches. The first derives from Dell Hymes's (1974) formulation of the *ethnography of communication* (also called the "ethnography of speaking"). The second is John Gumperz's (1982a, 1982b) work in the area of *interactional sociolinguistics* (see also Gumperz & Hymes, 1972). The third approach examines *language socialization* processes and focuses on the development of language use appropriate to a given community (Schieffelin & Ochs, 1986).

Hymes, coming from the tradition of linguistic anthropology, was interested in understanding how speakers accomplish social goals in given social situations in particular speech communities. His contributions—building on previous work, especially by Roman Jakobson—include the concept of *communicative competence* and the characterization of language use in nested contexts, namely, *speech situation*, *speech event*, and *speech act*. In addition, Hymes introduced the *SPEAKING model* as a mnemonic (Setting and Scene, Participants, Ends or goals, Acts, Key, Instrumentalities, Norms, and Genre) for examining all aspects of speech events that affect the form language takes and the associated language and social functions it fulfills. This model, moreover, provided qualitative researchers with a methodological tool or a frame for focusing on data to collect, and allowed for systematic and easily comparable analyses of situated language practices with a particular focus on the macrolevel of social situations and settings in which language is used.

Seminal works in the ethnography of communication tradition include Philips's (1983) study of how language differences between Warm Springs Indian and Anglo children in schools, for example the organization of interactional sequences and the use of silence, often made Anglo teachers perceive Native American children's behavior as reticent or noncommunicative rather than polite and deferential, as the students intended. Likewise, Heath's (1983) study of the literacy practices of three social groups revealed how values associated with particular language practices are socially constructed according to cultural norms and expectations. Eckert (2000) blended qualitative and quantitative methods to study the social structure of a typical high school. Her description and analysis of student cliques, "jocks," and "burn-outs" allowed her to demonstrate how language serves to structure social groups. What these studies have in common is their connection to the roots of ethnography: long-term participant observation in order to come to an understanding of language use from an insider (emic) perspective.

The second research tradition—interactional sociolinguistics established by John Gumperz (1982a, 1982b)—focuses on the face-to-face immediate context of interaction with the goal of understanding how each turn at talk influences subsequent turns at talk in ways that link any particular conversation to broader social categories. Such microlevel analyses of language use allow researchers to trace the linguistic and associated social origins of tensions that may exist across speakers that reflect broader patterns of inequality and that can lead to miscommunication. For example, Gumperz (1982a) analyzes how Indian and British participants in three short conversations had radically different perceptions of the attitudes and intentions of the Indian participants, based on the intonation patterns they used in simple questions: While the Indians intended to convey respect and deference, the

British perceived their interlocutors as “surly and uncooperative” because the communicative value of rising as opposed to falling intonation patterns on simple questions are reversed for speakers of these two different English-speaking speech communities. While this perspective focuses on a careful analysis of the linguistic form, it further requires the researcher to link the analysis of language features such as intonation to socially defined relationships between speakers.

Research from a *language socialization* perspective (Ochs & Schieffelin, 1984; Schieffelin & Ochs, 1986; Ochs, 1988) also examines language in use contextually and qualitatively. Here the primary focus of research is on how individuals—in particular children in their native communities—come to use language *appropriately* (i.e., in line with community norms). This strand of research is cross-cultural and also rests on the tradition of ethnographic observation and careful analysis of interactions, primarily caregiver and young child interactions. Such work, recently extended to include a focus on life-long socialization into new communities, focused on how individuals come to be “speakers of culture” (Ochs, 2002).

Observing Language Use in Context

To engage in qualitative sociolinguistics research means to spend time carefully observing and analyzing language in context in order to understand the language practices of individuals, the motivations or intentions underlying those practices, and how these language practices relate to society’s norms or expectations about language. Johnstone (2000) traces this tradition of documenting language use to the field methods used by dialectologists in the 19th century who were interested in describing the linguistic characteristics of speakers of regional varieties. In contrast to quantitative sociolinguistics research, qualitative sociolinguistics research involves in-depth and often long-term observation of individuals and groups interacting naturally in society. Whereas a researcher using quantitative methods may use statistical correlations to show, for example, the complex connections between gender and social groups, a qualitative researcher may approach a similar question by analyzing both routine practices and “telling” examples to demonstrate how language constructs identity. For example, Ek (2009) analyzes how a young Guatemalan American woman negotiates her identity in contexts (home, church, and school) that represent and structure conflicting expectations with respect to ethnicity and gender. While quantitative researchers’ data and analyses address questions of *how often* or *how much* a particular language practice occurs and is associated with social groupings, qualitative analyses are better suited to questions of *how* and *why* people engage in these practices (Johnstone, 2000).

Issues and Tools in Data Collection

There are several important issues related to collecting data on people’s language practices. The first applies to both quantitative and qualitative methods, and was recognized early on by Labov as the *observer’s paradox*. The dilemma arises from the fact that language use is highly situated and dependent both on speakers’ perceptions of what their interlocutors know and need to know, and on how they wish to present themselves to their interlocutors. Therefore, when an observer enters the social scene, their presence changes the dynamic of how speakers use language, and data (language practices) are altered simply because the observer is there to record them. For example, if participants perceive the researcher as an outsider, they will likely adjust their speech, by simplifying their grammar and lexis (foreigner talk), or by altering the form or content of what they say in subtle ways to accommodate the researcher’s presence. This might affect the production of exactly the

kinds of in-group linguistic markers or expressions of shared understandings that sociolinguists are interested in documenting.

There are several ways of counteracting the effect of the observer's paradox. Consonant with ethical issues related to working with human subjects, the preferred method is to be forthright about the purpose of the study, and to spend enough time interacting with people in the research setting so that the researcher's presence becomes familiar and participants' language use reverts mostly to what it would have been before the researcher arrived. This method, however, generally presupposes long-term engagement with the community, and does not resolve the observer's paradox as much as require researchers to locate themselves in the study and recognize that they have become part of the social scene they are investigating. Likewise, if researchers study a group of which they are already members or "insiders," they will have better direct access to the group's unfiltered language practices, though their insider status may cause other issues for their ability to analyze and interpret the data.

The tools for collecting qualitative sociolinguistic data are relatively straightforward; researchers generally rely on observation or participant observation supported by some combination of questionnaires, interviews, field notes, and recordings. The questionnaire or survey is a common instrument in both quantitative and qualitative studies since it can efficiently gather a large number of responses in a short period of time. The responses are easy to tabulate and present a straightforward set of results. Qualitative surveys often include Likert-scale (e.g., a five-point scale indicating agreement with a particular statement) and some open-ended items (Dörnyei, 2003). The limitation of questionnaires for language research is that they measure linguistic perceptions or beliefs rather than actual language practices, and include unrecorded adjustments to those perceptions based on the concept of the observer's paradox. It is also deceptively difficult to design good questionnaire items that will be interpreted in the same way by all respondents. Interviewing, like surveys, gathers *elicited data* by directly posing questions to participants. While interviewing is not as efficient as questionnaires, good interviewing techniques (Seidman, 2006) can yield rich insights about participants, in particular their own attitudes and perspectives on language use in the particular context under study. Field notes and recordings both serve to document *naturalistic*, that is, in situ language practices, language practices that are not directly elicited by the researcher. Taking field notes is a common practice in ethnography and is unobtrusive, although researchers are restricted by how much they can write down and are not able to go back and recheck the accuracy of their notes. Audio and video recordings have the advantage of allowing researchers to transcribe interactions more accurately. However, recording devices can be obtrusive—although less so today in many contexts, with digital devices so prevalent and much smaller in size. Nonetheless, as with all other forms of data collection, recording equipment always both focuses and therefore limits the data that can be gathered for analysis.

Recent Trends in Qualitative Sociolinguistic Research

Since the late 1990s, a number of new approaches to qualitative sociolinguistic research have emerged, each stemming from the traditions outlined above, but drawing new insights from theorizing and research in related fields. Most notable is the influence of sociocultural theory and, in particular, the *community of practice* model from cognitive science (Lave & Wenger, 1991), which has been taken up to examine language practices (Bucholtz, 1999; Eckert, 2000). With the introduction of this perspective a number of concepts, originally part of the work of either Hymes or Gumperz, have received greater attention. In particular, with the introduction of the community of practice as an alternative to the concept of

the speech community, the concepts of identity, ideology, and power have led to a shift in focus from understanding the normative behavior of individuals in groups to examining language practices at the margins, that is, language practices that individuals engage in to resist, subvert, or change community-wide practices. These studies examine the ambivalence, tensions, and contradictions that define intragroup as well as intergroup differences (Rampton, 1999).

Recent work has moved away from a normative or essentialist view of language practices, and aims to examine and explain the multiple and fluid ways in which language is used by particular groups of people in particular contexts. Nevertheless, these new approaches continue to employ the core data-collection techniques and insights from earlier research, while at the same time incorporating a different range of theoretical frames for analysis, frames that draw on a critical perspective of how language and society mutually structure one another.

In addition, there is a caveat worth noting with respect to the “quantitative-versus-qualitative” distinction; since the mid-1990s, following criticisms by variationist sociolinguists as well as anthropological linguists on work grounded in a single tradition, combined or mixed-methods approaches have emerged, which aim to provide richer explanations of observed differences in language use among members of communities under study. Those richer explanations, coming from a more in-depth examination of social contexts in which language use occurs, have been referred to as the third wave in sociolinguistic research (see Eckert, 2008).

Qualitative Teacher Research

ANNE BURNS

Introduction

The notion of teachers being active participants in research has a relatively long history in the field of general education. However, it is only since the late 1980s that it has received increasing attention and acceptance in the field of English language teaching. In this entry I discuss what is meant by teacher research and consider qualitative approaches typically used in teacher research. In particular I focus on action research, an approach to undertaking research which has gained ground in language teacher education.

What Is Teacher Research?

A range of terms is used to refer to research carried out by teachers. Among these are “teacher research,” “practitioner research,” “(collaborative/participatory) action research,” “reflective inquiry,” “teacher praxis,” and “teacher as researcher inquiry.” What they essentially have in common is that the research comprises investigation undertaken by in-preparation or practicing classroom teachers. However, classroom research cannot be defined as research undertaken by teachers, as it may be conducted by those working primarily as academic researchers. And action research may be undertaken by a wide range of practitioners in very different fields (e.g., business/management, policing, community social work). Bailey (2001, p. 491) makes useful distinctions between the terms “classroom research,” “teacher research,” and “action research”: “the term *classroom research* refers to the location and focus of the study. *Teacher research* refers to the agents who conduct the study. *Action research* denotes a particular approach . . .” Thus, while teacher research is usually undertaken in teaching contexts, it could be carried out elsewhere. Borg (2010, p. 4) claims that “Teacher research is thus a broader term than action research—while action research (when conducted by teachers) will also be teacher research, not all teacher research follows the procedures which define action research.” In this article, however, I focus on teacher research located in classrooms, and more specifically English language teaching (ELT) classrooms. In order to delineate even further discussion of what is now a large area of literature and research, the main part of the entry will deal with action research: its epistemological underpinnings, its processes, its methods, and its status in the ELT field.

Baumann and Duffy-Hester (2000) argue that teacher research in classrooms is characterized by several common features: the *emic*, or insider, perspective of researchers who have unique, situation-specific participant roles in inquiry; the blurring of theory and practice as *praxis*, that is, the mixing of reflection and practice within the research process; and the pragmatic and action-oriented nature of the research, whereby teaching is subject to inquiry, exploration, and evolution. Cochran-Smith and Lytle (1999, p. 22) summarize teacher research:

in the broadest possible sense to encompass all forms of practitioner inquiry that involve systematic, intentional, and self-critical inquiry about one’s work in K–12, higher education, or continuing education classrooms, schools, programs, and other formal educational

2 QUALITATIVE TEACHER RESEARCH

settings. This definition . . . does not necessarily include reflection or other terms that refer to being thoughtful about one's educational work in ways that are not necessarily systematic or intentional.

Cochran-Smith and Lytle's definition makes a helpful distinction between teacher research and reflection on practice. Their definition is in line with Baumann and Duffy-Hester, who stress that teacher research should be disciplined, intentional, and systematic, drawing as required both on more established methods from qualitative and quantitative paradigms and on emerging approaches (e.g., narrative/critical inquiry, introspective techniques, memoir, formative experiments) which offer ordered modes of inquiry.

In the field of general education, teacher research, overlapping with mid-20th-century developments in action research for teachers, has a detailed history. References to agendas and methodologies for teacher research are traceable to the intellectual traditions of Aristotle, and range from the work of Dewey (1904) to Kemmis and McTaggart (1988) and into the present (see Lytle & Cochran-Smith, 1994, for extended histories of teacher research). Developments in the second-language teaching field emerged in the 1980s (van Lier, 1988; see also Burns, 2005), although one early proponent was Lane (1962), who argued for teacher "experimentation" in the language classroom. Teacher research, and particularly action research, in ELT has burgeoned, especially during the last decade and a half (Burns, 2011). Various movements in curriculum theory and teacher education underpinned this emerging interest, including

- communicative language teaching,
- teachers as curriculum developers and course designers,
- the learner-centered classroom,
- classrooms as social contexts,
- reflective practice,
- teacher cognition,
- teachers as learners,
- the knowledge base of teaching,
- learner strategies, and learner independence and autonomy.

Concepts such as these which have permeated the field mediated the view that professional teachers benefit from becoming active and reflective investigators of their working environments.

Action Research as a Basis for Teacher Research

One of the most well-known forms of teacher involvement in research in ELT is action research. Acknowledging some of the subtle differences in terminology alluded to above, action research incorporates the following:

- It is research typically carried out by practitioners in a given field. In the field of ELT, teachers are therefore seen as major players.
- It offers a flexible, adaptive approach to doing research since it does not adhere to a particular research paradigm. The point of action research methodology is to use empirical approaches that provide a best fit for the issues under investigation.
- It allows for close and intimate engagement of the researcher in the research process. Action researchers are at the same time actors and investigators; thus, the technique is well suited to classroom and pedagogical investigation.

- It enhances and systematizes conditions that typically pertain to classroom practice. It harnesses the inevitably reflective dimensions of teaching and integrates them with affordances for more evidence-based practice than is normal in most classrooms.

Action research can be envisaged as embracing a “family” of research approaches. It is not “either/or” in methodological orientation but is eclectic, potentially drawing on both quantitative and qualitative paradigms and methods in ways that are the most appropriate for finding answers to practical challenges. It is typified by successive (iterative) cycles that involve researchers in phases of activity, reflection, empirical data collection, evaluation, and interpretation. As the research evolves, later cycles should become refined in their methods, data, and interpretations as the researcher’s understanding deepens (see <http://www.scu.edu.au/schools/gcm/ar/whatisar.html> for useful definitions and resources for action research). Action research is often viewed as most productive when undertaken as a participatory or collaborative process as this allows for critical dialogue among those who are the most involved and affected by developments in practice (Kemmis & McTaggart, 1988; Burns, 1999).

Action researchers typically begin by identifying a “research-worthy” aspect of the practices or conditions within their immediate social environment, then plan strategies to enhance, mediate, and understand what is going on. The twin goals of action research are change (for development and improvement) and evidence (for understanding). Although action research is sometimes described (even dismissed) as “problem-solving,” this characterization underestimates the intentions and scope of action research. The action and understanding that are at the base of action research are not simply to “fix up” technical teaching matters. Rather they are to enable practitioners to develop their own critical and evidence-based theories of practice which, given the particular education context and conditions, may differ materially and empirically from a disciplinary field’s formal theories for practice.

While methods for data collection are eclectic, teacher action research is often commonly associated with qualitative strategies, probably because these may be more amenable and have been more generally represented in published accounts. Table 1 identifies methods that are frequently deployed.

Table 1 Methods for collecting action research data (adapted from Burns, 2010a, p. 57)

<i>Observational strategies</i>	<i>Nonobservational strategies</i>
Examples: • Observation by teacher or colleague on particular aspects of classroom action. • Brief notes or recorded comments made by the teacher while the class is in progress. • Audio or video recordings of classroom interaction. • Transcripts of classroom interactions between teacher and students or students and students. • Sociograms, maps, or layouts of the classroom that trace the interactions between students and teacher. • Photographs of the physical context.	Examples: • Interviews using semi-structured or open-ended questions. • Focus groups/class discussions. • Questionnaires and surveys. • Journals, diaries, and logs kept by teacher or learners. • Classroom documents or artifacts, such as teacher-made or textbook materials used, samples of student writing, speaking tests, assessment portfolios, or student self-evaluations.

4 QUALITATIVE TEACHER RESEARCH

In teacher action research, data collection should be balanced in a mutually reinforcing way with the priorities of teaching and learning. Data collection is not an end in itself, but a means to deepen personal practical knowledge, analytical skills, explanation, understanding, and interpretation.

Action Research in ELT

Over the last 20 years of the ELT teacher research movement, there have been various key phases, mainly reflected through the kinds of publications that have emerged. Three major types have marked this trajectory.

How-to Introductions and Guides

Several early publications gave impetus to the teacher research movement by focusing on the “how-to” of conducting research in classroom contexts. Nunan (1989, p. xi) aimed to provide “a serious introduction to classroom research to language professionals who do not have specialist training in research methods.” Specifically, the purpose of this volume was to initiate teachers and teachers in preparation into ways of investigating and understanding their classroom practices. This volume was closely followed by Allwright and Bailey (1991), who were interested in introducing teachers to what researchers had learned about classrooms and how teachers “might go about continuing the explorations in our own classroom” (p. xvii). In the epilogue to this volume, Allwright outlined his emerging notion of “exploratory teaching,” a parallel movement to teacher research, mostly recently manifested as exploratory practice (Allwright & Hanks, 2009). Over the years, as his later publications explain, Allwright has moved away from the notion of teacher research, which he criticizes for overburdening teachers, and toward the notion of practical understanding through exploration. While not specifically foregrounding teacher research, the concept of reflection as a central dimension of professional teaching was central to Wallace (1991), while McDonough and McDonough (1997) highlighted again the idea that the “interface” between research and teaching should be explored by teachers themselves. Similarly to the previous volumes, they offered research advice and “techniques” for teachers to understand and explore ways of doing research on classroom issues and questions. In the 2000s more resources providing such guidance have gradually become available.

Teacher Accounts

During the 1990s few accounts of teacher action research were available through journal and other publications. Of examples that did exist for would-be teacher researchers, Edge and Richards (1993), editing a volume for the IATEFL Teacher Development Special Interest Group (TD SIG), included accounts from Israel, Poland, and Australia. Richards (1998) provided short international case studies written by classroom teachers in the format of “context, problem, solution” with accompanying comments by well-known teacher educators. However, not all of these accounts could be said to conform to the systematic phases and data collection required in teacher action research. Perhaps the most sustained examples of teacher research at this time were the accounts in the *Teachers’ Voices* eight-volume series, edited in Australia by Burns, Hood, and de Silva Joyce (Burns & Hood, 1995) and culminating in Burns and de Silva Joyce (2005). Other contributions came from special issues of the *TESOL Journal* (Volume 4, Issue 1) and *The Canadian Modern Language Review* (Volume 54, Issue 1). During this decade, teacher researchers and their mentors would have had to search across numerous journals to retrieve accounts authored by teachers.

The field has since moved rapidly on with more and more accounts written by teachers being published since 2000. Journals that devote space to teacher research include *Profile*, *English Teaching Forum*, *The Language Teacher*, *ELT Journal*, and the revived *TESOL Journal* now published online. Teacher researchers are able to access examples from a wide range of international contexts, such as collections of research reports that have emerged from the Middle East (Dubai and the Sultanate of Oman) and Asia (Singapore and Hong Kong). Professional associations like TESOL and IATEFL have also continued to promote and publish teacher accounts. A series published by TESOL which has contributed greatly to putting teacher research on the map is the *TESOL Language Teacher Research Series*, which features volumes from different world regions: Asia, Europe, the Americas, the Middle East, Australia and New Zealand, and Africa (see Burns, 2010b, for a comparative review of these collections).

Researcher and Teacher Educator Analyses

Academics involved in teacher education have also contributed to discussions of teacher research, sometimes as part of broader analyses of professional development. While book-length treatments of language teacher research from teacher education perspectives are relatively rare, notable examples critically analyzing the processes and outcomes of including teacher research in teacher development programs appeared from the early 1990s. These publications have dealt with issues such as the rationale, methodologies, experimentation, understanding, and impact that emerged from incorporating teacher research components into professional development. Accounts by teacher educators of learning from the experiences of introducing teachers to research come from India, China, Australia, Israel, the USA, Turkey, Hong Kong and Indonesia, and the UK (see Burns, 2005, 2011, for references to these publications). They document the benefits, challenges, and insights gained from these experiences. Benefits claimed include strengthening of teacher and teacher-researcher collaboration, development of personal and professional knowledge, enhancement of reflection and critical evaluation of classroom practices, growth of interest in research and knowledge of how to conduct it, greater sense of professionalism, and affirmation of effective practice. However, there is also no doubt from these accounts that the concept of teacher research faces numerous challenges. It is to the constraints and impediments that confront teachers in doing research that we now turn.

Constraints and Impediments in Teacher Research

Despite the advocacy of teacher research over two decades and the now considerable body of work building up around this theme, it cannot be denied that numerous obstacles still lie in the way of teachers undertaking research. Of these, time to do research is a prime constraint recognized from the early literature (Nunan, 1989). Teachers are rarely given time to research, or are rewarded for doing so, and generally have considerable teaching loads. Therefore, motivation to do research may not be high. Other limitations include indifferent, or even hostile, school cultures, leading to unsupportive or isolated conditions for would-be researchers; teachers' lack of research awareness, knowledge, and skills; beliefs of school leaders or peers that research brings little to teaching, or is of little interest; lack of resources or funding; and casualized work conditions (see Borg, 2010).

Even where conditions are more positive, teachers can feel that they are being "forced" to do research in order to support hidden policy or administrative agendas, as Miller (1990, p. 114) articulates: "nothing would please some administrators I know more than to think that we were doing 'research' in their terms. That's what scares me about the phrase 'teacher-as-researcher'—too packaged. People buy back into the very system

that shuts them down.” At a time when many education systems around the world face greater funding squeezes, increasing performance management, and calls for teacher accountability, teachers may well perceive being called on by officials to do research to be a powerful disincentive.

Critiques of Teacher Research

A major critique that has faced teacher research in the past, and continues to face it, is its quality and rigor. Arguments include lack of reliability, overreliance on narrative and description, limited data analysis, the technicist/practical nature of the research, lack of critical depth and ethical accountability of experimentation with learner participants (see Burns, 2011). Some commentators consider the whole notion of teacher research as naive. Block (2000, p. 138) opines that it is “strong in theory but very difficult to carry out in practice.” Dörnyei (2007, p. 191) assesses it as “a noble idea” that “just does not seem to work in practice,” as “there is too little of it.” He argues that it is primarily promoted by “researchers” and is therefore “top-down,” and, “ironically,” undemocratic. He questions whether it is in fact “viable” at all as research, as teachers “with little background knowledge and insufficient research experience,” would be likely to produce “questionable or trivial results.” Others echo his reservations. Ellis (2010, p. 89) refers to “methodological limitations” and casts doubts on its value to academic research.

In response to these kinds of criticisms, some have argued (Crookes, 1993) that teacher research needs to be judged not by the criteria of positivist research (experimentation, generalizability, replicability), but by other standards. These would include maintaining relevance to practice, testing relevance and reliability through cyclical reiteration (Kock, McQueen, & Scott, 1997), ensuring triangulation, incorporating sustained involvement and coding checks (Burnaford, 2001), and focusing on internal validity (Anderson & Herr, 1999). Currently, more lively and robust discussion on such standards takes place in disciplines beyond ELT (engineering, business, management, sociology, and so forth), which have increasingly incorporated action research into their fields of practice in relation to vocational needs. Similar extended debate within the ELT field would serve to seek legitimate acceptable standards for teacher research.

Conclusion

Although teacher research in ELT seems to be an unstoppable movement, it has still to show widespread impact on teachers and on empirical findings in the language teaching field (Borg, 2010; Burns, 2011). This entry has highlighted both some of the benefits claimed for teacher research and the impediments placed in the path of teacher involvement. In its defense, it can be argued that the whole notion of ELT teacher research is in its infancy and has yet to develop the support, sophistication, and reach that some would demand of it. The potential for the field of the teacher research movement would seem to lie in acknowledging a role for teachers in the enterprise of discovering, investigating, and understanding localized practices, and therefore in the testing out of the relevance of currently accepted theory, research, and policy.

Quality in Interpreting

ECIS RESEARCH GROUP: RAFAEL BARRANCO-DROEGE, ÁNGELA COLLADOS AÍS, MARÍA MANUELA FERNÁNDEZ SÁNCHEZ, OLALLA GARCÍA BECERRA, EMILIA IGLESIAS FERNÁNDEZ, E. MACARENA PRADAS MACÍAS, AND ELISABETH STÉVAUX

Interpreting quality is a multifaceted and complex concept resulting from a variety of communication situations and interpreting types, including conference, community, court, and signed language interpreting. It also comprises the views, motivations, and goals of the interpreters and all other stakeholders—speakers, event organizers, public institutions, trainers, and so on.

Through the years, interests in quality research have evolved. Many questions still relevant today had already been addressed in the 1950s by interpreters who approached their work from an intuitive perspective. The 1970s saw psychologists carrying out quantitative studies which focused on the cognitive processes in simultaneous interpreting. They gauged quality in terms of errors in the transfer of linguistic information. In the 1980s and 1990s, interpreting scholars took research into their own hands to meet their specific goals and interests. They elicited the end users' perceptions about different quality parameters and examined the factors enhancing or undermining quality in conference settings. In the course of time, research on quality has become more interdisciplinary, has resorted to different methodologies, and is increasingly addressing the specific needs of modalities such as community, court, and signed language interpreting.

However, the concept of interpreting quality remains elusive for several reasons. Although there is some consensus as to a core of quality parameters, the relative importance granted to each parameter varies depending on the communication situation, the interpreter's role, and the needs and preferences of the stakeholders. In practice, the notion of "absolute quality" can be unrealistic, as it may be inappropriate or difficult to maximize quality in all of its parameters simultaneously. Therefore, interpreters deliberately foreground some quality parameters at the expense of others in order to fulfill communication preferences and achieve "quality under the circumstances."

To address this dynamic notion of quality, scholars have carried out empirical studies to identify patterns in the users' perception of quality, as well as factors that maximize or minimize the quality of the interpreter's performance in different settings. Research is taking place from two perspectives, focusing, on the one hand, on the relationship between the features of the interpreter's output itself and their perception by human agents (*product-oriented approach*), and, on the other hand, on the relationship between source speech, target speech, and circumstances (*process-oriented approach*).

The product and the process of interpreting have been addressed both in the profession and in training. For the purpose of quality assurance in a variety of market situations, professional associations and international organizations have defined standards and codes of conduct to address different aspects, for instance the role of the interpreter and working conditions. In their turn, trainers start by focusing on process-related aspects in order to gradually build up the students' skills, and turn to the product in the final assessment, in order to comply with the needs of the profession.

The Perception of Quality

Most studies that address the quality of performance in interpreting have focused on the various stakeholders' perceptions of the interpreter's output, defining a core catalog of quality parameters: *accent*, *accuracy*, *complete rendition*, *correct grammar*, *fluency*, *intonation*, *logical cohesion*, *pleasant voice*, *style*, and *terminology*, among others. However, other factors like verbal back-channeling, eye-contact, body language, and attire are also taken into account in oral consecutive and bilateral interpreting and in all kinds of signed language interpreting, while aspects like microphone discipline and time lag are considered in simultaneous interpreting.

Quality perceptions were first studied in conference settings, and users' a priori expectations were elicited with the view to disentangle the relative importance they granted to the various quality parameters. Findings have shown that content-related parameters are regarded as more important than form-related parameters, such as voice features. In particular, *accuracy* and *logical cohesion* appeared consistently at the top of rating scales, while *pleasant voice* and *accent* were always bottom of the table. This was true even in settings such as TV interpreting, in which expressive features are particularly apparent. As to the rest of the parameters, their relative positions in the ranking have been observed to be variable.

Findings also revealed differences in expectations depending on users' professional background, gender, age, type of event, and experience with interpretation. Furthermore, users' preferences also vary with regard to the interpreter's role, as users in conference settings seem to favor interpreters staying in the background and playing what has been termed the "ghost role." In contrast, a more active role by interpreters is often advocated in community and signed language interpreting settings, although different views on the degree of coparticipation exist. This debate is driven by those who point to factors such as power relations and differences in the participants' social backgrounds that gain special relevance in these settings. Moreover, interpreters are more demanding than end users.

In an effort to test their findings on users' a priori expectations, scholars matched them against their actual assessment from an observational perspective in which users were asked to assess real interpretations regarding different quality parameters and in experimental studies in which selected parameters were modified in a controlled environment. These studies showed that weaknesses in certain form-related parameters such as *intonation*, *fluency*, and *accent* spilled over other parameters and degraded the perception of overall quality and even of *accuracy*, traditionally ranked top of users' expectations. The findings seem to confirm that users' mental representations of their priorities in interpreting quality are not quite in line with their actual perception of the quality of a given interpretation. This could be due to parameters sharing certain perceptual features (subparameters) or to psychological priming. In addition, gender, social background, experience with interpreting services, turn-taking rate of the interpreters, and the duration of the interpreting session have been seen to have a marked effect on the assessment of quality.

Consequently, the idea that end users are in a position to judge certain parameters, particularly *accuracy*, is challenged, and the need for a more precise definition of each quality component seems to be in order. In this spirit, recent strands of research have been using an interdisciplinary observational approach in order to analyze assessment patterns and find out more about the interaction between parameters.

Quality and the Interpreting Process

End users' perceptions of quality may provide a convenient yardstick of their satisfaction, but a comprehensive approach to quality also requires a close examination of the source

speech and the interpreter's rendition, as well as of the interpreting situation under which they are produced. Thus, in order to gain a deeper understanding of quality, scholars have examined the process of interpreting, taking into account the features of the discourse, the communication situation, and the mental representations involved. On the one hand, they have analyzed the interpreting product as a speech in its own right, trying to identify symptoms of possible failures and achievements in the interpreter's rendition (for instance, hesitations, false starts, and repairs). On the other hand, they have compared the interpretation with the source speech, both in terms of semantic equivalence and of communicative effect.

In the early days of interpreting studies, researchers carried out experiments in order to analyze aspects such as the speaker's speech rate, the length of the source speech and the availability of documentation on the interpreter's output. The validity of these studies has been challenged due to methodological shortcomings, as quality was considered to be tantamount to the occurrence of errors, substitutions, omissions, and additions in the interpreter's output as measured against the source text, and research approaches were refined in order to include pragmatic and contextual viewpoints more relevant to the reality of interpreting. Evidence suggests that the presence of *problem triggers* in the source speech and the interpreting situation, such as proper nouns and the speaker being out of sight of the interpreter, can jeopardize interpreting quality in general and accurate rendition of the source message in particular. Nevertheless, there is a high variability among interpreters, even when they have the same background, making apparent the complexity of research on quality once again.

Ongoing observational research is using corpora of genuine source speeches and their interpretations so as to cross-examine *problem triggers* with signs of achievements and failures in the target speech. Current research is resorting to large corpora in order to analyze variables such as setting, language combination, directionality, speaking style and speech rate, with a view to identifying patterns in interpreters' choices and strategies, and how professionals go about monitoring and optimizing the quality of their output in different situations. These findings are expected to shed light on key issues in the design of professional standards and prove instrumental to the improvement of training.

Professional Standards and Codes of Conduct

Interpreting, as any social activity, is streamlined by norms, defined as internalized cultural conventions and constraints resulting from the expectations of the receiving context and society and governing the methods and strategies applied by the interpreter.

Norms are generally implicit, but they lie at the root of the professional standards and codes of conduct developed by professional associations and the interpreting services of international organizations and reflecting both in admission requirements and the quality control built into the interpreters' workflow. These types of regulations are not always formulated in terms of the parameters defined in quality research, but address a number of quality-related factors especially relevant to professional practice, like ethical issues (faithfulness, integrity, and confidentiality) and working conditions (contract clauses and booth specifications).

The development and social acceptance of standards is conditioned to the recognition of the authority of professionals and by the users having concrete expectations and a shared understanding of the quality of interpretation. In practice, interpreters are still struggling for the recognition of their profession and a consensus on the definition of their role, especially in contexts such as community, court, and signed language interpreting. This, along with the large number of local and regional professional associations, could be a reason for the coexistence of several professional standards and codes of ethics. However,

there is a certain degree of consensus at regional and national level in community, court, and signed language interpreting, and at an international level in conference interpreting.

In turn, some standardization agencies have also developed quality-oriented standards for interpreters. Examples are UNI 10547:1996 (Italy), ÖNORM D 1200:2000 and D 1201:2000 (Austria), Taalmerk Standard (the Netherlands), and ASTM F2089-01:2007 (USA). Interestingly enough, the European standard EN 15038, released in 2006, focuses exclusively on written translation.

Quality Assessment in Interpreter Training

While assessment of student candidates takes into account their profile and potential, there is a high degree of unanimity that graduates must live up to the same quality standards as professional interpreters. For this reason, in summative assessment, their performance is measured against the yardstick of professional standards. Accordingly, traditional training approaches have gravitated around practical guidelines aimed at improving the *product* of the interpretation, focusing particularly on the accurate rendition of the message of the source speech.

Still, during training, ongoing assessment strives to measure the development of competences and skills by the students. Since these two are subordinate to the interpreter's role in the interaction between three parties (speaker, interpreter, and recipient), modern training models have factored in both the features of the source speech and the communication situation, in an attempt to parameterize the interpreting *process*. In order to optimize the mental resources available during interpretation, students are encouraged to develop strategies aimed at minimizing certain cognitive efforts. These strategies may consist in dealing with the informational, cultural, and linguistic difficulties posed by the source speech, anticipating information, efficient note taking, and examining the frames and events involved and the intended function of the source and the target speeches.

In modern training models, the learning process is sequenced into a number of stages, each with their own goals and assessment procedures. However, there are no generally accepted standards as to the pace at which difficulty should be increased, and, most importantly, as to which specific weaknesses and achievements need to be focused in each stage in order to aid in the gradual development and refinement of interpreting skills, the appointment of evaluators (assessment by one or more instructors, peer-assessment, or self-assessment), and the evaluation procedure (for instance, merely writing down comments on a transcript of the source speech or analyzing recordings of the students' interpretations). Although different assessment criteria have been used, it has been observed that they often yield similar results, as they evolve around the same set of quality parameters and standards.

Quantitative and Mixed Methods: Overview

JOAN JAMIESON AND KIM MCDONOUGH

The types of language-related issues investigated by applied linguists are detailed and complex. They cut across many domains of social life from school to business, law, and government, to name a few. Questions pertain to issues such as the effectiveness of particular language-teaching practices, the language needs for prospective employees in a business, comprehensibility of language used for legal purposes, and assessment of language ability to meet government-set standards. In view of the many purposes of applied linguistics inquiry, it is not surprising that applied linguists draw upon a range of empirical methods for conducting research (Mackey & Gass, 2005; Dörnyei, 2007). The quantitative and mixed methods section of the encyclopedia introduces the characteristics of two approaches to research, which have been adopted and adapted from methods in social science, through entries that explain basic concepts underlying them, show the statistical tools used by researchers, and illustrate their use with descriptions of example studies.

Basic Concepts

Applied linguistics research aims to create new knowledge and address language-related problems in the real world. Accordingly, basic concepts underlying research activity consist of those that help to conceptualize the creation of knowledge, including their basis in particular worldviews and their methodological tools (Johnson & Onwuegbuzie, 2004; Onwuegbuzie, 2007). Quantitative methods are often characterized as working from the assumption that a single reality exists and therefore the KNOWLEDGE CLAIMS that are the objective of such research reflect this view. Quantitative research typically relies on deductive reasoning and hypothesis testing to confirm or refute theories, and therefore the statistical concepts including INFERENCE, PROBABILITY AND HYPOTHESIS TESTING, SAMPLING: MIXED METHODS, SAMPLING: QUANTITATIVE METHODS, and VARIABLES used to support such thinking are important. Quality concepts overarching the research process are related to the validity of results (see VALIDITY: MIXED METHODS) and the ethics of research practice (see ETHICS IN RESEARCH). Nine entries describe the basic concepts (see DESCRIBING AND ILLUSTRATING QUANTITATIVE DATA) that underlie quantitative and mixed methods research.

The methodological tools for data collection in applied linguistics include TESTS, INTERVIEWS, NATURALISTIC DATA, SURVEYS, VERBAL REPORT, PROMPTED PRODUCTION, PROMPTED RESPONSES, and GRAMMAR ANALYSIS TECHNIQUES (Gass & Mackey, 2007). Eight entries explain how these tools are used to collect data, as well as the factors that researchers consider when choosing methods for data collection. These basic concepts of quantitative research are important for understanding mixed methods research as well because mixed methods research contains elements of both quantitative and qualitative thinking, and in fact the mixed methods entries included emphasize their quantitative component. A more comprehensive introduction to qualitative research is available in the qualitative research section of the encyclopedia, and a more qualitative approach to mixed methods can be found in Hesse-Biber (2010).

Statistical Tools

The statistical tools and the software that makes them accessible are fundamental to quantitative and mixed methods research in applied linguistics. The use of a variety of statistical tools is described in 14 entries to explain the logic of the statistical tests in the research design, assumptions about the data, and the effect on interpretations when assumptions are violated. Each entry highlights issues in the use of the statistical tools through examples of applied linguistics research. Whenever possible, both parametric and nonparametric procedures are described. Information is also included on how to interpret results using “rules of thumb” and explanations of effect sizes. The following statistical tools have been included: COMPARING TWO INDEPENDENT GROUPS, comparing more than two independent groups (see COMPARING TWO+ INDEPENDENT GROUPS), COMPARING GROUPS WITH MULTIPLE INDEPENDENT VARIABLES, COMPARING GROUPS WITH MULTIPLE DEPENDENT VARIABLES, COMPARING TWO RELATED SAMPLES, comparing more than two related samples (see COMPARING TWO+ RELATED SAMPLES), TESTING INDEPENDENT RELATIONSHIPS, MULTIPLE REGRESSION, STRUCTURAL EQUATION MODELING, CLUSTER ANALYSIS, discriminant analysis (see DISCRIMINANT FUNCTION ANALYSIS), FACTOR ANALYSIS, TIME SERIES, and META-ANALYSIS.

Example Studies

Seventeen of the entries illustrate how researchers have used quantitative and mixed methods tools in their research. In contrast to the statistical tool entries, which provide an overview of each test, the example study entries illustrate how these tools have been used to answer questions of interest in various areas of applied linguistics. These entries provide detail showing how researchers used a particular statistical test from research question to data entry, reading and interpreting results, and displaying the data. Each entry has cross-references to entries that explain the statistical tools as well as to those that provide an overview of the area of research represented by the example. Many of the entries include a data set related to the example study that readers can use to try out the statistical tool or data analysis technique.

Ten quantitative studies illustrate the use of statistical tools in the following areas: assessment and evaluation (see ASSESSMENT AND EVALUATION: QUANTITATIVE METHODS), bilingualism and multilingualism (see BILINGUALISM AND MULTILINGUALISM: QUANTITATIVE METHODS), corpus linguistics (see CORPUS LINGUISTICS: QUANTITATIVE METHODS), cognitive second language acquisition (see COGNITIVE SECOND LANGUAGE ACQUISITION: QUANTITATIVE METHODS), discourse and interaction (see DISCOURSE AND INTERACTION: QUANTITATIVE METHODS), language learning and teaching (see LANGUAGE LEARNING AND TEACHING: QUANTITATIVE METHODS), phonology (see PHONOLOGY: QUANTITATIVE METHODS), pragmatics (see PRAGMATICS: QUANTITATIVE METHODS), sociolinguistics (see SOCIOLINGUISTICS: QUANTITATIVE METHODS), and technology and language (see TECHNOLOGY AND LANGUAGE: QUANTITATIVE METHODS). Seven mixed methods entries illustrate how qualitative and quantitative techniques were combined to address topics in assessment and evaluation (see ASSESSMENT AND EVALUATION: MIXED METHODS), discourse (see DISCOURSE: MIXED METHODS), language learning and teaching (see LANGUAGE LEARNING AND TEACHING: MIXED METHODS), literacy (see LITERACY: MIXED METHODS), phonology (see PHONOLOGY: MIXED METHODS), sociolinguistics (see SOCIOLINGUISTICS: MIXED METHODS), and technology and language (see TECHNOLOGY AND LANGUAGE: MIXED METHODS).

The quantitative and mixed methods entries were selected according to three main goals: (a) to introduce basic concepts related to research design, data collection, and analysis; (b) to describe the statistical tools commonly used in applied linguistics research; and

(c) to provide examples of research that illustrates the use of quantitative and mixed methods tools across subdisciplines in applied linguistics. These entries provide a glimpse of one way in which knowledge in applied linguistics is constructed. More comprehensive information about the knowledge in applied linguistics is available in the rest of the encyclopedia.

Quantitative Methods

HOSSEIN FARHADY

Introduction

There has been a plethora of ongoing debates in the field of applied linguistics on many aspects of quantitative research method (QRM) in the last few decades. Despite the validity and significance of the debates and their contribution to sharpening our understanding of the concepts, QRM remains as one of the most widely practiced approaches in social sciences in general, and in applied linguistics in particular (Lazaraton, 2005; Murtonen, 2005). Although such debates are important and necessary, this entry will focus on explaining the major features of QRM in as nontechnical terms as possible.

Most scholars would agree with the classic definition of the term “research” as a systematic approach to answering questions (Hatch & Farhady, 1982, p. 1). There are three key terms in this definition: a question, a systematic approach, and an answer. The controversies in the field are not on the definition of the term “research” but on different interpretations of the key terms in the definition. For instance, the nature of the question and the way it should be formulated, the approach to be taken to answer the question, and the quality of the answer to the question are all issues upon which no wide agreement exists among scholars. The differences in the interpretations of these concepts stem from different theoretical orientations that scholars adhere to because advocates of each theory believe in a number of assumptions that justify their interpretations (Kinn & Curzio, 2005). Therefore, to put the issue in an appropriate context, first an explanation on theoretical assumptions of QRM follows and then a description of how the three key terms in the definition function in practice.

Theoretical Assumptions

Generally, an inquiry is performed within a particular school of thought commonly referred to as a paradigm. This paradigm is believed to have four cornerstones: ontology, epistemology, methodology, and axiology (Onwuegbuzie & Leech, 2003). There are several popular paradigms such as positivism, constructivism, and relativism each with some axiomatic principles that scholars follow, or should follow, in practice. Since QRM is rooted in the positivistic paradigm, a brief definition of the key concepts and their treatment in this paradigm will help clarify the characteristics of QRM within this framework.

Ontology raises questions about the nature of reality and the nature of human beings in the world. According to positivism, there is a real world, the reality of which is expressed in terms of the relationships among variables, and the extent of these relationships can be measured in a reliable and valid manner using *a priori* operational definitions. Positivists believe in the verifiability principle, which states that something is meaningful if and only if it can be verified by direct observation. Thus, ontologically, positivism is a school of thought that excludes everything from its consideration except natural, observable, and measureable phenomena and their interrelationships.

Epistemology asks how we know the world and what the relationship between the inquirer and the known is. Epistemologically, positivism places a premium on objective observation

2 QUANTITATIVE METHODS

of the “real world” out there. Positivists contend that the researcher (i.e., knower) and the object of the study (i.e., known) are independent. As such, researchers should remain objective and impartial in studying phenomena (Cohen, Manion, & Morrison, 2000).

Methodology focuses on the best means of acquiring knowledge about the world. Methodologically, positivists use deductive reasoning which is a system for organizing known facts in order to reach a conclusion. Conclusions are true only if the premises upon which they are based are true. That is, positivists emphasize the importance of a priori hypotheses and theories. The researcher manipulates at least one variable and then measures its effect on another variable, controlling potentially extraneous variables. Through such a procedure, valid cause–effect relationships are believed to be established and generalized as laws.

Axiology deals with the ethics and asks how moral a person a researcher should be in the world. Every ontology or epistemology has its own ethical stance toward the world and the self of the researcher. Positivists believe that inquiries should be value free. In other words, the researcher’s values, interpretations, feelings, and musings have no place in the positivist’s view of scientific inquiry. Positivists prefer rhetorical neutrality, involving an exclusively formal writing style using impersonal voice and specific terminology.

Putting the above-mentioned principles together, a working definition for QRM can be formulated as an inquiry where an impartial researcher investigates cause–effect relationships between the variables in a world of real objects. This derived definition is conceptually matching textbook definitions where scholars contend that QRM numerical data are collected on the variables and analyzed using mathematical methods (Aliaga & Gunderson, 2002). Following this definition, the three key concepts of “question,” systematic approach, and “answer” in QRM will be detailed below.

Formulating the Research Question

QRM starts with a question which is formulated about the relationship between at least two variables. A variable is any attribute that changes from person to person (height), place to place (size), or time to time (temperature). Variables can be concrete, that is, directly observable and measurable such as height and weight; abstract, that is, not directly observable or measureable but inferred from observations and measurements such as intelligence and language ability; discrete or categorical, that is, either/or type such as left or right handedness, male or female; and continuous, that is, can take any value such as weight and language ability. Research questions can be formulated about the relationship between the variables to indicate either a cause–effect relationship or just go togetherness between them.

Example 1: *What is the effect of using multimedia tasks on the learners’ listening comprehension (LC) ability?*

Example 2: *What is the relationship between the students’ LC and reading comprehension abilities?*

The first question is of a cause–effect type where the researcher sets out to investigate whether using multimedia tasks will have any effect on the learners’ LC ability. The second question, however, is of correlational type where the researcher intends to find an existing relationship between the two variables. No instruction or manipulation is planned to find a cause–effect relationship since the researcher appears on the scene after the fact and has no role in changing any one of the variables.

An important point in formulating a research question is defining the variables under investigation as clearly as possible in both theoretical and operational forms. Theoretical

definition puts the variable in the context of theories from which it is derived. To provide a reasonable theoretical definition, an in-depth review of literature needs to be performed. Operational definition, on the other hand, is to suggest a clearly measurable procedure for the variable in question. For example, LC ability may be defined theoretically as the ability to understand oral messages in real-life situations, and operationally as one's performance on a test which is designed to measure one's ability to understand oral messages.

Theoretical and operational definitions of a variable given in a particular research context may not be acceptable to all readers because they are specific to that research design. For instance, there may be different definitions of LC ability in theory and different measures of LC in practice. However, a working definition should be provided by the researcher that is most reasonable in the context of research. Despite the potential disagreement among scholars, it is an advantage of QRM that the researcher and readers share common definitions of the variables.

In addition to defining the variables, the researcher should determine the functions that variables are designed to serve in the process of research. Most common functions that a variable can serve in QRM are: independent, dependent, moderator, intervening, control, and extraneous. An independent variable is the main or the cause variable which is under the control of the researcher to be manipulated, while the dependent variable is the variable that depends on, or changes as the result of, the manipulation of the independent variable. For instance, in the example above, using multimedia tasks is the independent variable and performance on a measure of LC ability is the dependent variable because performance on this measure depends on the quality, quantity, and effectiveness of the multimedia tasks designed by the researcher.

A moderator variable is the variable that may influence the outcome of the dependent variable without being necessarily manipulated. For instance, within the context of this example, the researcher may hypothesize that males and females may benefit differentially from the multimedia instruction. In such a case, gender, as a moderator variable, may change the outcome of research. A control variable, on the other hand, is a variable whose effect is controlled or eliminated by the researcher so that the variation of this variable does not influence the outcome of research. Suppose the researcher believes that familiarity with computer may have an effect on the achievement and performance of the learners. Therefore, to eliminate the effect of familiarity with computer, the researcher selects participants who are absolutely unfamiliar, or equally familiar for that matter, with computer technology. In this case, any effect due to computer familiarity is removed from the research design, that is, controlled.

An intervening variable is the variable that intervenes between the independent and the dependent variables. It is often left unobserved and unmeasured because it is very often an abstract variable. In our example, due to the effect of the independent variable, that is, multimedia instruction, the participants learn and improve their LC ability. Although this learning process can neither be observed nor measured, its effect is manifested in the measurement of the performance on an LC test. In other words, the learning process is situated between the independent and the dependent variables and intervenes with the outcome of the research without being observed or measured. And finally, an extraneous variable is a variable whose presence is neither observed nor accounted for in the research design. Such variables may influence and contaminate the outcome of research without the researcher's awareness. In the example above, many variables such as age, educational background, learning style, motivation, and so forth may have some effect on the students' learning. In short, any variable that is not controlled by the researcher and may influence the outcome of research is called an extraneous variable.

When the research question is formulated with well-defined variables, it is converted into a research hypothesis to be tested. A hypothesis is a tentative statement about the outcome of research and can take two forms: null and alternative. A null hypothesis,

4 QUANTITATIVE METHODS

symbolized as H_0 , is generally stated in the form that the manipulation of the independent variable will not have an effect upon the dependent variable. The alternative hypothesis, on the other hand, symbolized as H_1 , stipulates an effect, either positive or negative, of the independent variable on the dependent variable. For instance, null and alternative hypotheses for the example above would be:

- Null H_0 : *There is no relationship between using multimedia tasks and improvement in LC ability, or*
 Using multimedia tasks will not have any effect on the improvement of LC ability.
- Alternative H_1 : *There is a positive/negative relationship between using multimedia tasks and improvement in LC ability, or,*
 Using multimedia instruction will have a positive effect on (facilitate) or a negative effect on (debilitate) the LC ability of the participants.

Selecting a null or an alternative hypothesis is often based on the review of the past research findings. If there is strong evidence about the relationship between the two variables, the researcher might decide to choose the alternative hypothesis to confirm or reject the previous findings. However, when there are controversial reports on the relationship between the variables under investigation, researchers usually go with null hypothesis. Possible forms of hypotheses are illustrated in Figure 1.

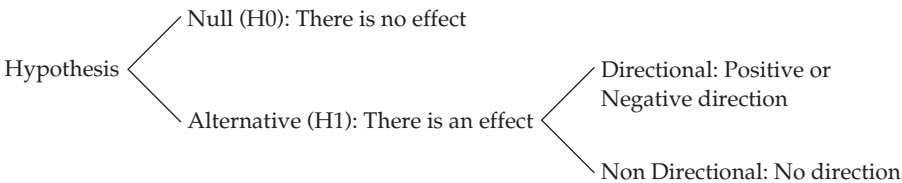

Figure 1 Forms of hypothesis

Following a Systematic Approach

When the research hypothesis is formulated, the researcher attempts to choose a systematic approach, technically called a research design, to test the research hypothesis. Many factors including the nature of the research question, the type and number of variables, the number and groups of subjects participating in research, and the type of collected data interact to form an efficient design that will optimize the outcome of research. In fact, there is no single best way to determine the design of research (Clark-Carter, 2004). However, research designs can be broadly divided into two major groups of experimental and nonexperimental where cause–effect relationships are investigated in the former and correlations in the latter. Depending on the factors mentioned above, experimental designs are classified into three categories of true, quasi-, and pre-experimental. A true experimental design is the most rigorous of all and has the following principles:

1. Subjects are selected randomly.
2. Two groups of experimental and control are formed.
3. A pretest is administered to both groups.
4. A treatment is given to the experimental group and a placebo to the control group.
5. A posttest is administered to both groups.

In a true experimental research, subjects are selected randomly. In random selection, every individual is given an equal chance to be included in the research and no bias is exercised since the selected sample should represent, as closely as possible, the population to which the findings of the research are intended to be generalized. Then the participants are divided into a control group and an experimental group. In the example above, the researcher should make certain, as much as possible, that the two groups have the same LC ability before starting the experiment. Therefore, even after random selection which minimizes prior differences among the selected groups of participants, a pretest is given to both groups and their performance is compared before the experiment. When the equivalence of the groups is statistically established, the experimental group receives the treatment, in this case multimedia tasks on LC, and the control group receives a placebo, or an irrelevant treatment, to make sure that both groups are treated similarly. After a predetermined length and intensity of giving the treatment, a posttest is given to both groups to see the effect of treatment on the participants' LC ability. A schematic representation of a true experimental design is given in Figure 2.

Figure 2 A schematic representation of true experimental design

It should be mentioned that not all QRM designs meet all these requirements. It is often very difficult to set up a true experimental design, especially in an educational context. If any one of the requirements of the true experimental design is not met, the researchers use pre-experimental designs. Further, quasi-experimental methods are designed to compensate for the weakness of pre-experimental designs. Of course, the farther away a researcher moves from meeting the requirements of the true experimental design, the weaker the claims about the cause-effect relationship between the variables will be. In the following section, some of the most common types of pre- and quasi-experimental designs will be presented. For the purpose of illustration, the symbol G will be used to refer to a "group," R to "random," T for "treatment," and X for a score.

The simplest design includes only one group of subjects, one treatment, and one test given to the subjects. This design, referred to as one shot case study, is represented in Figure 3.

Figure 3 A schematic representation of one shot case study

This design can be used as a base to build up more complex designs. For instance we can improve this design by adding one more group to make it a posttest only design as illustrated in Figure 4.

Figure 4 A schematic representation of a posttest only design

6 QUANTITATIVE METHODS

To make this design more rigorous, pretests are given before the treatment and the resulting design is a two intact group pretest–posttest design as illustrated in Figure 5.

G1	X1	T	X2
G2	X1	0	X2

Figure 5 A schematic representation of a two intact group pretest–posttest design

Pre-experimental designs are frequently used in educational contexts in general, and in applied linguistics in particular because conducting true experimental designs is extremely impractical in educational contexts. For instance, two intact group pretest–posttest design, where a particular treatment, for example, multimedia tasks, is given to one group and no treatment to the other group, and both groups receive pretest and posttest, is very close to a true experimental design. The only missing parameter is the random selection of the subjects. It is not simply practical to select a group of subjects randomly from among the subjects who have already been placed in different classes on the basis of certain criteria.

To compensate for this shortcoming, quasi-experimental designs are developed where one group of subjects functions as both the treatment and control group. A common example of such a design is time series design. In time series design one intact group of subjects is selected and exposed to the treatment on several occasions and tested after each treatment. In one form of time series design, the subjects receive a pretest before the experiment. Then they receive a few sessions of treatment in a row as if they were in the experimental group and a posttest. Then they follow their regular instruction without receiving the treatment as if they were in the control group and a posttest. This design, called repeated time series design, is schematically represented in Figure 6.

Figure 6 A schematic representation of repeated time series design

There are two likely outcomes for this design. If the average score of the subjects increases from the pretest to the first posttest, it indicates that the treatment has had a positive effect on the performance of the subjects (black line) provided that there is no considerable increase from posttest 2 to posttest 3 indicating that the increase in the first part of the experiment was due to the treatment. However, if there is a consistent increment in the scores from posttest 1 to posttest 2 (dotted line), it implies that the treatment does not have a specific effect and the trend of increase is the natural result of education.

Another version of this design is to present the treatment and test in alternating sessions. This design, called alternate time series design is depicted in Figure 7.

Figure 7 A schematic representation of alternate time series design

If the treatment is effective, the scores on the tests would show a rising and falling pattern as shown in the graph implying that the rise of the scores is due to the treatment. If the treatment does not have any effect, the score pattern will not show systematic rise or fall.

Factorial Designs

The designs mentioned above all involved one independent variable and one dependent variable. The test scores are obtained at different points in time either prior to or after the treatment. More often than not, the research project involves more than one variable. It is quite a common practice to include a moderator variable or allow more than one level of observation for the dependent variable. In such cases, factorial designs are employed. In fact, any simple design can be expanded into a factorial design by adding more levels to the independent variable or adding a moderator variable. For instance, in the example provided before, suppose the researcher speculates that boys and girls will respond differently to receiving multimedia tasks regarding LC ability. In such a case, a moderator variable is added to form a posttest only factorial design as shown in Figure 8.

G1 (M)	T	X
G2 (F)	T	X

Figure 8 A schematic representation of posttest-only factorial design

The design can be more rigorous by adding a pretest before the treatment to form a pretest-posttest factorial design shown in Figure 9.

G1 (M)	X1	T	X2
G2 (F)	X1	T	X2

Figure 9 A schematic representation pretest-posttest factorial design

This is very similar to intact group pretest-posttest design with the difference that in the factorial design the groups are male and female. Another example of factorial design would be to introduce two levels of the dependent variable. For example, giving multimedia tasks in class versus offering them through the Internet will form two groups for the same independent variable. Each group will receive multimedia tasks in a different form but the dependent variable is the same, that is, improving LC ability.

A few points are worth mentioning here. First, all the above-mentioned research designs, whether one way or factorial, involve only one dependent variable, that is, one measurable variable. Therefore, they are called univariate designs. When there are two or more dependent variables in the study, the design will be more complex and is called multivariate design (Meyers, Gamst, & Guarino, 2005). Second, not all QMR falls into the category of experimental designs. QMR could also be descriptive or correlational. When the focus of

research is on investigating the existing relationship between the variables without any intervention or manipulation, it is referred to as correlational research and the design is called bivariate since two sets of scores are obtained from each subject. In correlational research the selection of independent and dependent variables is arbitrary because none of the variables is manipulated. For instance, to investigate the relationship between students' language ability and their academic success, a correlational design is used by correlating scores on a measure of language ability and a measure of academic success obtained from each subject.

Following a version of experimental or nonexperimental designs, the researcher collects data on the variables. Data collection is an important stage in QRM because the validity of the findings of research will depend very much on the quality of the collected data. Therefore, great care should be exercised in selecting appropriate instruments for data collection.

Answering the Research Question

In order to answer the question set forth at the beginning of research, the collected data should be analyzed. Data analysis in QRM is performed by utilizing a body of techniques called statistics. There are good guidebooks on how to apply statistical techniques using computers. Probably SPSS is the most commonly used statistical package with good guidebooks specifically written for data analysis in applied linguistics and SLA research (Larson-Hall, 2010).

The final stage in quantitative research is to interpret the findings and discuss the implications of the findings for improving the theory and their applications to practice. The validity of the findings depends on the validity of research. Despite the objectivity in QRM, researchers should observe some reservations in making conclusions about the findings because statistical significance does not necessarily lead to a firm law. There is always human wisdom that should be applied to the interpretation of the findings. Strong statements should be avoided because the findings may not be perfectly valid.

There are two types of interrelated validity in QRM: internal and external. Internal validity refers to the extent to which the findings are due to the process of research and not due to other variables, and external validity refers to the extent to which the findings are generalizable to the population. To maximize the internal validity, researchers focus on the unique effect of the treatment by controlling as many variables as possible that might have an effect on the dependent variable. However, the more controlled the context of research, the farther away it will be from the real world and the findings will lose generalizability to the population because the context of population will be different from the context of experiment. That is, the higher the internal validity, the lower the external validity or generalization of the findings to the population. On the other hand, to maximize the external validity, the context of research should approximate the context of the natural real world. In such a case, the effect of the independent variable will be blurred due to the intervention of so many uncontrolled extraneous variables, thus decreasing the internal validity. Therefore, depending on the context of research and the importance of the findings, researchers are recommended to keep a balance between the internal and the external validity of the findings.

Further, some factors such as history, that is, what is happening to the participants outside the context of experiment; mortality, that is, the attrition in the number of participants during the experiment; test effect, that is, the effect of pretest on the posttest, just to name a few, are considered threats to the validity of the findings of research. As Kinn and Joan Curzio (2005) state, in many of the 450 research articles they examined, the

methodological and statistical procedures used in the quantitative research to inform recommended practices were not convincing. This implies that only in rare cases can researchers meet all the rigorous and vigorous requirements of QRM, especially in the contexts of human and social sciences. Therefore, researchers are strongly recommended to interpret the findings with caution and reservation.

Quebec Charter of the French Language and Canadian Language Policy

FRANÇOIS VAILLANCOURT

The language policy of Quebec differs from those of other Canadian provinces and of the federal government since it is aimed at protecting and enhancing the use of the Francophone majority languages within its territory, while the other policies are aimed at helping the territorial minorities (Francophone outside Quebec, Anglophone within for the federal policy) preserve their language, mainly through transmission to their children by minority-language education.

The need for a language policy emerged in Quebec in the 1960s following studies for the federal Royal Commission on Bilingualism and Biculturalism that predicted a drop in the share of Francophones in the population of Quebec and showed that Francophones were amongst the lowest earners in Quebec. After two false starts (Bill 63 and Bill 22), Bill 101 was adopted in 1977 and, while amended, remains in place for the most part as designed. Bill 101 was a contentious piece of legislation pitting Francophones and collective rights against non-Francophones and personal rights. It remains contentious in 2010 as evidenced by the debate over restrictions on the use of private schools to access English public schooling.

The demographic issue was addressed by a primary/secondary schooling restriction that limited access to English-language schools; it was self-binding of the Francophone majority by law, replacing binding by a decree of Catholic leaders and restrictions on children of non-Canadian schooled parents—that is, international immigrants, usually allophones. Bill 101 was successful in this matter; in 1970, 205 of children to be targeted by Bill 101 attended English-language schools; in 2010, one can say that 85%+ attend French-language schools. In addition, Quebec was given powers with respect to the selection of international immigrants.

The economic issue was targeted by both Bill 101 and a set of economic policies aimed at strengthening Francophone ownership of Quebec's economy through both better education and greater access to capital. These policies led to an improvement in the returns on the labor market in knowing French and to an increase in the control of the economy by Francophones, as shown in Table 1 and Figure 1.

The end result of 50 years of change (1960–2010) is Quebec, a constituent unit of a bilingual federal country with substantial autonomy (measured by share of spending and revenue-setting powers) and a vibrant French culture that still faces a long-term threat of demographic decline and thus disappearance, assimilation, or both. Its new struggle is the integration of immigrants.

Figure 1 Share of Quebec's economy controlled by one of three groups, four years (adapted from Vaillancourt, Lemay, & Vaillancourt, 2007, table 5)

Table 1 Earnings premium with respect to unilingual Francophones, three sets of language skills, men and women, Quebec, four years (Vaillancourt, Lemay, & Vaillancourt, 2007, table 5)

	1970	1980	1990	2000
Men: unilingual Anglophone	+10	-7	-12	-18
Men: bilingual Anglophone	+17	0	0	0
Men: bilingual Francophone	+12	+5	+7	+12
Women: unilingual Anglophone	0	-5	0	0
Women: bilingual Anglophone	0	0	+5	+7
Women: bilingual Francophone	+10	+7	+11	+17

Note. We calculate net returns to language skills accounting for level of education, years of labor market experience and its square and weeks worked. We use the statistical tool of ordinary least squares (OLS). The dependent variable is the natural logarithm of labor income, and the independent variables are listed in the text as accounted for; these are the same variables as those used in Vaillancourt and Touchette (2001). A zero (0) indicates a given language skill has no significant impact on labor income; hence the labor income associated with that skill is the same as the labor income associated with the unilingual Francophone language skill, the reference category.

Quirk, Randolph

CHRISTIAN MAIR

Randolph Quirk was born on the Isle of Man in 1920. In 1939 he enrolled at University College London (UCL), to read English under Albert Hugh Smith and Norse under Raymond Wilson Chambers. Having served in World War II from 1940, he resumed his studies in 1945. On his graduation in 1947 he joined UCL's English Department as a lecturer and was subsequently awarded the degrees of MA, PhD and DLitt, all solely in the fields of medieval English and Norse. He spent a year at Yale and Michigan in the United States as a Commonwealth Fund (Harkness) Fellow in 1951–2 and moved to Durham to become a Reader (1954) and subsequently a Professor of English (1958). He returned to UCL as a Professor of English in 1960 and succeeded Albert Hugh Smith as Quain Professor in 1968. Beyond his immediate professional domain in (English) linguistics, Randolph Quirk has been active in university and academic politics, serving as vice-chancellor of the University of London (1981–5) and president of the British Academy (1985–9). In recognition of his services, he was made a life peer (Lord Quirk of Bloomsbury) in 1994 and, as such, became an active member of the British House of Lords. The following universities have expressed their recognition of his work through the award of honorary doctorates: Aston, Bar Ilan, Bath, Brunel, Copenhagen, Durham, Essex, Glasgow, Helsinki, Leicester, Liège, London, Lund, Newcastle-upon-Tyne, Nijmegen, Open University, Paris, Poznan, Prague, Reading, Richmond, Salford, Sheffield, Southern California, Uppsala, and Westminster.

Randolph Quirk is one of the key figures of 20th-century English linguistics, who has made important contributions in numerous and diverse fields. Trained in the methods of philology and the history of the Germanic languages, he actively worked to extend the scope of English linguistics to include description and analysis of the present-day language, and in particular the spoken language. His first successful attempt at marrying the old and the new was to breathe new life into the study of Old English by describing it in terms of the “modern” structuralist methods (Quirk & Wrenn, 1955). However, the first of several claims to fame was the inception in 1959 of the Survey of English Usage, based on psycholinguistic elicitation and a one-million-word corpus of spoken and written British Standard English covering a wide variety of textual genres. Unlike the roughly contemporaneous Brown Corpus of Present-Day Edited American English, the SEU corpus was not designed “for use with digital computers” initially but made available in the form of millions of paper slips and a searching system based on filing cabinets into which these slips were sorted following a complex routine of classification. Potential drawbacks of this low-tech approach to corpus linguistics were more than compensated for by the delicacy of the transcription and analysis. For example, the richness of the prosodic and paralinguistic transcription of the original SEU spoken data has not been equaled by any digital successor project, including the later digital version of part of the Survey spoken materials itself (London–Lund Corpus, cf. Svartvik & Quirk, 1980). The hundreds of studies of instances of variable usage in contemporary British English that have been based on the SEU corpus have profoundly changed the terms of the debate between prescriptive traditionalists and linguistic descriptivists.

“Quirk et al.” has become a household name as a shorthand reference to two major descriptive grammars of the English language, the 1972 *A Grammar of Contemporary English*

and the 1985 *A Comprehensive Grammar of the English Language* (both co-authored with Sidney Greenbaum, Geoffrey Leech, and Jan Svartvik). Through publications such as his seminal "Descriptive Statement and Serial relationship" of 1965, Randolph Quirk has also been a major innovator in theoretical thinking about grammar, developing the notion of gradience in syntactic structure, which helps us understand why grammatical categories which are clearly defined in the abstract may appear diffuse and fuzzy in language use and actual corpus data. A grammar which is robust and orderly in principle but has in-built room for flexible and context-sensitive extension is, of course, a grammar better suited to the needs of language teaching than an algorithmically designed formal grammar.

His numerous commitments in university administration and academic politics from the early 1980s meant that Randolph Quirk had to withdraw from the day-to-day management of the Survey of English Usage. He remained influential in the corpus linguistic community, however, and encouraged promising new initiatives "from a distance," as it were—for example the British National Corpus, completed in 1993, which at a size of 100,000,000 words was a daring venture into mega-corpus-building at the time.

Beyond his work on corpora and grammar, Randolph Quirk has been extremely influential as an informed commentator on language attitudes, English usage, and the politics of world English. Books such as *The Use of English* (1962, with Alfred Gimson and Jeremy Warburg), *The Linguist and the English Language* (1974), or *English in Use* (1990, with Gabriele Stein) combine scholarly expertise with lucid writing and a gift for focusing on that part of a linguistic controversy that interests the general public. At a time when British audiences still tended to have a prejudiced view of the status of American English, he spelled out the relationship between the two most important global reference varieties in a series of radio talks with Albert H. Marckwardt (later published as *A Common Language*—Marckwardt & Quirk, 1964). In addition, between 1969 and 1972, he found time to chair a government inquiry which transformed speech and language therapy into an all-graduate profession.

Long before the study of "varieties of English," "new Englishes" or "world Englishes" started booming in the 1980s and 1990s, Randolph Quirk had pointed out that "English is not the prerogative or 'possession' of the English. . . . Acknowledging this must—as a corollary—involve our questioning the propriety of claiming that the English of one area is more 'correct' than the English of another. Certainly, we must realise that there is no single 'correct' English, and no single *standard of correctness*" (Quirk, Gimson, & Warburg, 1962, pp. 15f.). It is against this background that we should read his defence of a global standard of English, which he expressed in a memorable exchange of views with Braj B. Kachru at the 1984 conference marking the 50th anniversary of the British Council (see their contributions to the collection of conference papers, Quirk & Widdowson, 1985). For Quirk, the pluricentricity of post colonial English is real, but a happy democracy of voices in which old and new Englishes, based in big and small communities, are spoken by native and non-native users, and share equal legitimacy and status, is a naïve illusion—and an illusion which may have dangerous social consequences, for example in the shape of endemic educational failure among marginalized social groups both in the Inner (ENL) Circle and in the Outer (ESL) Circle. In the heat of the debate Randolph Quirk was accused of perpetuating illiberal and conservative attitudes by some opponents. However, it seems that his assessment of a quarter of a century ago has stood the test of time surprisingly well, as has his skeptical refusal to join any of the linguistic bandwagons that have noisily come and quietly gone during his lifetime.

As a linguist and grammarian, Randolph Quirk commands the respect of his academic peers. All through his long career he has been among those experts on language whose advice has been sought and heard by the government, the media, and a wider general public. As *Homo politicus*, finally, he has left a mark in academic politics, the politics of English, and beyond. It is not surprising, finally, that Randolph Quirk, an energetic, charismatic,

challenging, and sometimes impatient teacher, has inspired generations of students, many of whom have become important (applied) linguists in their own right, such as, for example, Flor Aarts, Evelyn Abberton, Valerie Adams, Wolf-Dietrich Bald, Noel Burton-Roberts, Jennifer Coates, David Crystal, Derek Davy, Sidney Greenbaum, Liliane Haegeman, Michael Hoey, Robert Ilson, Ruth Kempson, Geoffrey Leech, Susan Peppé, Jan Rusiecki, Gunnel Tottie, and Jan Svartvik. The wide range of research interests developed by this group serves as vivid testimony to the key role Randolph Quirk has played in the modernization and expansion of academic research on language.

Race

LEWIS R. GORDON

This entry focuses on race as discourse and its relation to culture, which, too, is discourse driven. This is not to say that race is discourse and culture is the same but instead that, as meaningful realities, they are governed by generative rules that, in turn, are also conditioned by similar sets of rules. The concepts are, in other words, *relational*, and as such, their definition often points beyond them to additional relationships.

For race, we begin with the term. The word “race” has its origins in the Middle Ages in Andalucía, Moorish-controlled Iberia, in the word *raza*. The word referred to breeds of dogs, horses; Jews, and Moors. This arrangement of things brought together zoological terms and religious cultural ones in a way that asserts a schema beneath the normatively Christian, which alerts us to its theological origins, and, with the zoological and anthropological elements, its claims to a form of theological naturalism. The term, although referring both to animals and human beings—and, in some instances, even to botanical life—eventually became primarily a term used for human designations, especially as discriminatory practices and hierarchies were conjoined to the concept to collapse into *racism*. Reflected here is the connection between race, language, and culture. As Carolyn Fluehr-Lobban reflects:

If race is about phenotype, and language is about speech and communication, and culture is about common heritage and shared identity through distinct customs, dress, food, and more, why are these three so often confused? The answer may be that each is a convenient referent for “others” different from “ourselves” (whoever “we” may be) . . . (Fluehr-Lobban, 2006, p. 15)

This is not to say that human differentiation emerged in the Middle Ages. There is ample evidence in literature and artifacts from antiquity in which communities of people attempted to determine their location through difference. In most, differentia took the form of gods or deities above, animals below, and their group (designating what we would call “man” or the “human being”) in the middle. Since the middle was self-referentially specific, other groups of people were often determined in relation either more toward animals or toward gods. There were, however, instances in which other human beings were placed in the same location of the group producing the documents, with differences marked not as hierarchies but horizontally situated. In both cases, whether in relation to gods and beasts, to both and other human beings, the human being, or what we understand as designating what we call human beings, has always been relational. That the human being is a relationship with other beings has not, however, often matched the metaphysics of the societies in which this often mythic understanding takes place.

In the modern world, mythic knowledge was secularized as scientific inquiry. The search for what is inside nature (and by extension inside human beings), that made things work, led to the emergence of modern natural science and an effort to construct the same for the study of the human beings. Race, then, became a mark of human difference as science also became a search for explanations of how the variety of human beings came to be. This concern led to the development of what could be called “raciology,” where race became part of the repertoire of disciplinary and mundane discursive practices in the modern world and its own object of theoretical study. There was, in other words, race and the

metatheory (theory about the theory or discourse) of race. For the former, race was part of everyday life, and competent speakers of a variety of European languages understood it, without much reflection.

Oddly enough, the *practices* of race did not necessarily depend upon competent use of the word “race” (and its correlates in the European languages) because of the global political and economic realignment of world relations premised upon racial hierarchy, where European nations representing whiteness eventually regarded themselves as the natural master over the browner and darker ones they eventually conquered and colonized. The many clerics, soldiers, sailors, and prisoners involved in this process hardly worked with clear notions of the rationalizations behind the human differences they encountered. For some, physical difference at times entailed normative difference. Thus, racist consequences were at times present without the explanation of race explicitly stated. This afforded a form of presence of race and racism as ever-present—what sociologists, drawing upon the thought of Durkheim, refer to as originating from seemingly “nowhere” (see Daynes & Lee, 2008).

The metatheoretical work on race involves examining the discourse by which race is studied. The philosopher, jurist, and anthropologist Anténor Firmin offered a critique of this form in Paris in 1885 in his response to the racist anthropology of Arthur de Gobineau. In the USA, this critique was also developed, in response to the social Darwinism of Herbert Spencer, by W. E. B. Du Bois, who noticed not only that the study of race produces “problem” populations, but also that the very question of human sciences suffered from the problem of studying changing subjects as fixed and stable ones. Yet Du Bois also subscribed to the “message” model of race, where each group was presumed to offer through their unique social expression, through culture, a gift to humankind.

Other responses to social Darwinism included those of Franz Boas, who debunked primitivist appeals to some populations living in the present and others in the past. In all, the question of race was increasingly separated from being rooted in naturalistic accounts to more socially and eventually culturally driven ones. Among those were also developments from criticisms of science itself as an absolute basis of human understanding. The most influential thought from this end was the vitalism of Henri Bergson, which influenced developments in 20th-century ethnography and its correlative critical debates. The important distinction between animal life and human life, *zoë* and *bios* in Ancient Greek, raised questions of cultural life, and, as might be expected, race as expressions of such. The roots of cultural racism emerged here, where, it is believed, there are inferior cultures created, in turn, by inferior people. The circular logic here is straightforward: Inferior people create inferior culture, which is the mark of inferior people. Hidden in cultural racism, in other words, is the notion that some people *could not* create valuable culture, or, in some cases, culture at all. An additionally questionable consideration here is the notion of “good” and “bad” culture, since, in the end, the evaluation of each would be through criteria posed by the evaluator, whose culture is presumed “good,” or at least the standard of good.

The emergence of structural linguistics also affected the turn to the study of culture in important critical ways. Although the efforts by Ernst Cassirer are crucial here, the better known line followed from the impact of the linguist Ferdinand de Saussure’s work and the eventual conjunction of his ideas with developments in Marxism, phenomenology, and psychoanalysis. The effect was most commonly known as structuralism, which placed a premium on *discourse*, especially language, in the study of race and culture, and poststructuralism, which focused on the anti-essentialist dimensions of structuralism. The opening observation about relationality came to the fore in structuralism and poststructuralism, much of which was explored in the terms of the former and anticipated in the case of the latter, in the thought of the Martinican psychiatrist and philosopher Frantz Fanon.

Fanon argued that race was neither phylogenetic (species determined) nor ontogenetic (a matter of individual bodies). It was *sociogenetic*, produced by a social world, the world of culture. He also argued that within that social world, there are normative expectations that make racism, as a function of that world, “normal.” The problem, then, became one of examining the extent to which, as Du Bois had argued, the social, and by extension culture, as a changing and dynamically producing series of relations, can be transformed. In effect, then, the Du Boisian understanding of race as a discourse embedded in that of the human sciences of the modern world is substantiated by much of the metatheoretical discourse on race, including those, ironically, whose aims were the circumvention of race. It became present *as something to be avoided*.

The metatheoretical discourse on race, then, faced several important critical considerations. The first, as Du Bois noticed, was the tendency to ignore the force of self-critique. When encountering populations that do not fit the theoretical models and methodologies at hand, the response was often to treat the populations as recalcitrant, as problems, instead of assessing the viability of the discipline and its methods. Fanon, too, noticed this phenomenon, and he described it as the self-devouring of methods in the study of racism and colonialism. A group of scholars in African Diasporic philosophy and what has become known as Decolonial Studies in Latin America (see Gordon, 2006, 2008) have interpreted this critique as the identification of disciplinary decadence and colonial discourse (in which there is also the colonization of method). They have argued that race, as a human manifestation, exceeds singular disciplinary models of controlled study. It thus requires *transdisciplinary* efforts with the understanding of their own limits.

The second metatheoretical consideration pertains to the metaphysics of race. Here, the thought of Ernst Cassirer is again instructive. He argued for a relational understanding of reality in which meaning emerges also as a transition from signification to symbolization, which he described as “symbolic forms.” Many theorists subsequently refer to the same as “structure.” In Cassirer’s thought, however, the world of culture, manifested by symbolic forms, is not only one of intersections and overlapping relations or structures but also of *different dimensions*—by which he meant the emergence of a peculiarly human world. This is significant for the understanding of race, since it suggests that race, as a symbolic, self-reflective activity of the human species, is about the production of meaning *onto* human bodies. Culture, in this sense, is thus more radical than the folkways, customs, and specific linguistic practices of different groups. It is also the more radical basis of their expression—namely, a human world as a world of symbolic disclosure.

The dimensional view of race brings to the fore the lived reality of race and racism. Race theorists, from Du Bois to Fanon to the present, have observed how people differentiated by race seem to live in different worlds even when in spatial proximity or under singular national boundaries. Called double consciousness, this phenomenon involves for the designated-inferior racial subject a construction of the self as seen by the designated-superior subjects. While the dominated racial subject is forced to think and speak through two worlds—theirs to each other and the dominant language—members of the dominant group live and speak as if their world were complete. Realization that the dominant world lacks an understanding of the schemas beneath it leads to the emergence of a second form of double consciousness—*potentiated double consciousness*. This form involves identifying the missing elements of the dominant structure, which, in effect, unveils its fundamental incompleteness.

The formal correlates of double consciousness and potentiated double consciousness, if placed in the framework of linguistics, would be the grammatical structure of false universality. In effect, the potentiated critique is that the avowed universal grammar is particular, and that the claimed particular location (as subaltern, dominated, inferior) was *more* universal, albeit also not *the* universal. Learning the languages by which these

distinctions are made manifest in effect opens up worlds and transforms worlds akin to critical discussions of intercultural communication. The crucial point here, however, is that, as exemplars of culture, they are in principle communicable across each human divide. Race, then, is always a communicative practice, as Fluehr-Lobban reminded us, but the difficulty posed by racism is that it involves the rejection of its own communicability.

A growing body of literature examines dissociative elements of racial discourses. In work influenced by existential phenomenology, this tendency is characterized as bad faith, and they often criticize race-blind models of human study as enabling racial dominance by groups who control the conditions of their self-representation. Among those also influenced by poststructuralism, this criticism usually identifies genealogies of power and how, in governing subordinated groups, dominant groups produce racialized subjects through distinguishing themselves as nonracialized subjects. In concrete form, in many conversations, writings, or readings where race is not identified, it presumably means that a member of the dominant group is the subject. To be raceless, then, simply means the power to racialize others. In countries where whites are the dominant group, “racelessness” becomes a coded term for “white.”

Moreover, the structuralist and poststructuralist accounts also examine the semiological features of race discourses, where certain relations hide other relations. Thus, what is hidden in whiteness is its relation, in a binary system, to the gradations on which it is dependent for its designation. To be white as the extent to which one is not something else raises the question of whether one is also not something else by which whiteness is governed—that is, others who are *whiter*. These shifts of location, many of which are affected by shifting dynamics of power in societal institutions, leads to precarious efforts to stabilize racial categories, mostly through denial of the continued changes of the signs and symbols by which they could be meaningful. In psychoanalysis, where an unconscious is an underlying factor, processes of dissociation and trauma lead to discussions of dynamics of shame by which historical and other contextual resources are pushed to the wayside in linguistic performances of a preferred national (presumed as dominant group) *image*. Both the existential phenomenological and psychoanalytical (both of whose forms are too varied for elaboration here) converge on an understanding of the evasive tendencies of race discourses. Race, from these points of view, is an effort to avoid the risk of human communication.

Finally, although not exhaustively, efforts to stabilize race discourses, to fix the language of race, often lead to reductionistic models akin to the forms of disciplinary decadence mentioned earlier. To make the discourse pure, neat, and rigorously absolute leads to difficulties in accounting for the fact of racial mixture. These mixtures find correlates, as well, in discussions of cultural mixtures and linguistic mixtures. As with the disciplinary decadence model, some responses offer notions of isomorphism between race, language, and culture, where the result is one set of “whole” realities encountering another set of holistically constituted realities. Critics of this model include those in Africana philosophy of culture, who argue for the permeability and communicability of human communities, and those in what could be called the creolization-from-the-Global South groups, who examine creolization as genuine forms of mixture versus the forms where different groups live alongside each other instead of sharing, as their lived reality, the coproduction of culture.

Rating Oral Language

PAULA WINKE

Assessment of oral language is useful for many purposes such as estimating proficiency growth in communicative language-learning environments. A critical component in the process of oral assessment is the rating of the speech samples by highly proficient speakers of the targeted language who have been trained according to rating criteria established by the test designers. Because the score on an oral assessment is intended to reflect the performance of the test taker (McNamara, 2001), raters are expected to provide an unbiased implementation of the rating criteria and thus remain invisible to the scoring process. Yet clearly, research has well established that raters' personal beliefs or backgrounds may affect their rating processes and the resulting scores. Thus, the factors involved in rating oral language are complex and intricate. Rating oral language is more complicated than rating written language (essays) because more of the test takers' nonlinguistic characteristics (such as voice quality, accent, and, in the case of face-to-face or video-based testing, gestures, expressions, and general appearance) are revealed and may inadvertently influence raters' score assignment. To rate accurately and reliably, raters of oral language need to be guided, trained, and monitored to ensure that their personal opinions, beliefs, and backgrounds minimally affect the scores they assign.

Many factors beyond the raters also impact oral test performance. The most prominent is, naturally, the test taker. Other factors include the test designers, the test specifications, the test tasks, the interlocutors (in the case of face-to-face or synchronous testing), the method of oral testing (one-on-one, face-to-face oral interviews, group or paired orals, or computer-assisted oral testing), the rating scales, and the rating process. Test developers do not want any of these to add construct-irrelevant variance to the scores (McNamara, Hill, & May, 2002). Although many of these factors are constrained by the operational testing conditions and cannot be determined by test developers (such as how the test is administered—in person or through the computer), rater behavior is something that research has found controllable to a degree. Thus, in any oral testing program, test developers should understand not only how raters influence the scoring process, but also how to best prevent them from doing so in idiosyncratic ways.

Rating Scales

Testing programs try to render the rating process as objective as possible through the careful design of detailed rubrics for the raters to use while assigning scores. Rubrics outline the criteria raters should attend to in the rating process and upon which raters should base their judgments. The criteria are often borrowed from other sources, such as the ACTFL Proficiency Guidelines (Breiner-Senders, Lowe, Miles, & Swender, 1999) or the example rubrics constructed within the Council of Europe Framework of Reference (Council of Europe, 2001). Or they may be created on the basis of a program's proficiency goals and objectives or of observed learner behavior (Fulcher, 2003). Rating scales and criteria are best when they are short, to the point, and easy to interpret (Luoma, 2004). However, short rating scales sometimes conflict with the need to provide enough details so that raters are not left to their own interpretations of what qualifies spoken performance as good.

Rubrics may be holistic or analytic in nature. In holistic rating, raters assign a single score to the speech sample by taking into consideration the combined impact of different speech characteristics. With an analytic rubric, raters must attend to and rate distinctly different aspects of the test takers' speech, such as fluency, accuracy, complexity, and sociocultural competence (Iwashita, Brown, McNamara, & O'Hagan, 2008). With holistic rating, the individual characteristics of speech may be considered, but the rater must decide which characteristics have the most weight when assigning scores. In analytic rating, the rubric designates the weights of the different speech characteristics. Language testers have often discussed and analyzed the merits of each type of rating rubric (e.g., Alderson, Clapham, & Wall, 1995; Bachman & Palmer, 1996; Xi, 2007). The basic tenets of those arguments are that holistic scoring is more efficient, consistent, and cognitively simpler, while analytic scoring is more controlled and less dependent on raters' backgrounds, experiences, and value systems. An example of an analytic rating rubric used for rating the speech of native-English speakers learning Chinese, adapted from Winke (in press), is presented in Table 1.

Rater Training

Rater variability is impossible to completely eliminate, but rater training can effectively eliminate observable biases from scores (Lumley & McNamara, 1995; Fulcher, 2003). Rater training helps raters better understand the categories and criteria represented in the rating scale (Saito, 2008). Broadly speaking, rater training is conducted by having expert raters or trainers guide new raters through the rating process. The trainers and new raters discuss their use of the rating scale in judging selected performances of speech samples. Many language testing programs require raters to complete rater training and become certified as reliable raters by consistently rating a large sample of practice tests. Initial training sessions may be long (e.g., a three-day workshop followed by a month of practice rating) or short (e.g., a four-hour session). Research has found that longer rater training does not statistically improve the ratings of oral performance, but it has an effect on rating behavior: In particular, it may help raters set a frame of reference. In other words, training helps raters think along the parameters of the traits defined by the rating rubric and not use their own criteria in determining scores (Saito, 2008; Xi & Mollaun, 2009). Rater training may also be conducted between rater sessions to recalibrate or reorient raters to the internalized process of scoring. Wigglesworth (1993) found that training between rating sessions that included showing raters charts of their patterns of bias, estimated through Rasch analysis, increased inter-rater consistency in subsequent rating sessions. Other research has found that training can facilitate reliable rating in much the same way as long-term rating experience. Thus, rater training is essential to any oral assessment program because it helps raters consistently and reliably assign scores.

Rating Processes

Oral language can be elicited in at least two ways: live (in a face-to-face or online setting; in other words, *synchronously*, with a human interlocutor) or through a set of prerecorded prompts (*asynchronously*; e.g., via a computer). Each method impacts the types of possible rating procedures. In an asynchronous test of speaking ability, the test taker responds to prerecorded prompts and the test taker's speech is rated later (except in the case of automatically scored tests, such as Versant; see www.ordinate.com). Examples of asynchronous tests of oral proficiency include the Simulated Oral Proficiency Interview (SOPI), the Computerized Oral Proficiency Interview (COPi) (Kenyon & Malabonga, 2001), and the TOEFL Academic Speaking Test (TAST) (Xi, 2007). There are many advantages to asynchronous

Table 1 Analytic rubric for assessing Chinese as a foreign language

<i>Score</i>	<i>Accuracy</i>	<i>Fluency</i>	<i>Complexity</i>	<i>Sociocultural competence</i>	<i>Tones/accent</i>
1	Vocabulary and grammar not always accurate. Simple words and phrases not always correct.	Speech includes frequent pauses and hesitations; evidence of communication breakdown.	Speech comprises mostly single words or short, memorized stock phrases, mostly with present tense markers.	Evidence of culturally improper or non-native-like use of terms; may be unaware of what register to use.	Barely acceptable tones/accent. Chinese people not used to foreigner speech may not understand.
2	Vocabulary and grammar sometimes to mostly accurate. Words, phrases, and sentence structures not always correct.	Speech includes full sentences and natural fillers, but unnatural pauses and hesitations occur.	Speech includes full sentences, use of different tense markers, some use of connecting words or phrases.	Emergent use of Chinese words or phrases that indicate "thinking like a Chinese person." Some use of pragmatically correct register.	Acceptable tones/accent. Chinese people not used to foreigner speech may have a hard time understanding.
3	Vocabulary and grammar mostly accurate. Use of words, phrases, and sentences mostly correct.	Fluent speech with a few pauses and hesitations, normally rectified through circumlocution.	Speech contains full sentences with discourse markers. Use of various tense markers. Emergent use of advanced sentence structures.	Some evidence of "thinking like a Chinese person." Mostly pragmatically correct register.	Somewhat native-like tones/accent. Chinese people used to foreigner speech can easily understand.
4	Vocabulary and grammar very accurate and native-like.	Speech fluent without unnatural hesitations or pauses.	Able to be creative with language forms and use complex, advanced sentence structures.	Evidence of "thinking like a Chinese person." Pragmatically correct register.	Very native-like tones/accent. Chinese people can easily understand.

testing. Benefits include cost efficiency and the ability to collect multiple test takers' speech samples simultaneously and remotely (Weir & Wu, 2006). Multiple raters can listen to the recordings at a later time. Because raters of asynchronous tests hear recorded speech (meaning rater A and rater B hear exactly the same speech—their orientation to the speaker does not vary) and can listen multiple times, inter-rater reliability statistics (how consistent and similar raters are in assigning scores) from asynchronous testing can be viewed as extremely sound.

Synchronous tests are considered more time-consuming and expensive. When a test taker is administered a test synchronously, he or she interacts live with one or more interlocutors face-to-face, over the telephone, or through a synchronous online chat program or Web video-conferencing service (Volle, 2005). One or more of the interlocutors may also rate the test taker's speech simultaneously. However, when two raters rate a synchronously administered test, and one of those raters is the interlocutor, differences in score assignments might be attributable to the differences in the raters' perspectives: One rated from within the interaction, the other from outside. Nonetheless, this process of having at least one rater interact with the test taker is standard (Malone, 2003). Problematically, interlocutors as raters have been found to be more lenient in scoring than raters who rate recordings of asynchronously administered tests (Thompson, 1995), and individual raters have been found to rate differently depending on whether they are rating a live interaction or a recording of one. An alternative is recording the face-to-face or live test and having it rated afterwards by raters who did not participate in the oral test administration (McNamara & Lumley, 1997). This may be beneficial for the rating process because the raters are not cognitively overburdened, and yet the test taker responds to an interlocutor as in a real-life, communicative setting, which allows the rater to assess complex oral skills and interactive, communicative competence.

Rater Bias Patterns

No matter how much training a rater has had and how well the rating rubric is designed, rating oral language accurately on a scale is challenging. This difficulty stems, in part, from its socioaffective nature—there are personal attributes that can be perceived through speech, such as age, gender, or even ethnicity (through accent), that may influence how a rater perceives the speech. If the rater has any bias for or against such personal attributes, the biases may be reflected in the ratings he or she assigns. As described above, test designers attempt to lessen the impact of these biases through the design of thorough and detailed rating scales, as well as through intensive rater training programs and even rater retraining and recalibration programs. Yet raters still exhibit patterns of bias. Current research is focused on the origins of and reasons for these bias patterns.

One example of such research is the study of the first or native-language backgrounds of the raters and the differences in score assignment. As explained by Kim (2009), one reason why native and non-native speakers of the language being tested are examined in terms of rater variability is because testing programs are interested in exploring whether non-native speakers should be eligible as rater candidates. Research has shown various outcomes from having non-native speakers rate—it has shown that non-native raters can be more severe than native raters (Fayer & Krasinski, 1987); that native speakers can be the ones who are more severe (Brown, 1995; Hill, 1996), or that quantitatively there are no differences between native and non-native speakers (Kim, 2009; Xi & Mollaun, 2009). Thus, the debate continues. Fortunately, estimating biases statistically has become more simple in recent years with the development of multifaceted Rasch measurement (Weigle, 1998; Bond & Fox, 2001) and researchers' use of the computer program FACETS (Linacre, 2009) to implement Rasch analysis. Rasch analysis allows the researcher to uncover and understand raters' patterns of harshness or leniency in relation to any one group of test takers (Lumley & McNamara, 1995). Identifying these patterns as well as the characteristics in the rater and test-taker groups upon which they are dependent is the first step in creating tailored training programs to minimize bias.

Future Trends

Rating oral language is ever-evolving because advances in research improve our understanding of the rating process and the effects of rater training. Perhaps related to this research as well as to the constraints in testing environments, rating procedures continue to change. For example, rater training and recalibration efforts have been demonstrably effective in online settings (Hamilton, Reddel, & Spratt, 2001). With such findings along with cost constraints, more online rater training programs are emerging. In another area of research, ratings from face-to-face, oral proficiency tests have been shown to be reliable estimates of oral proficiency even when the testing is conducted in pairs (Davis, 2009; Ducasse & Brown, 2009) or group settings (Bonk & Ockey, 2003; Van Moere, 2006). Given this reliability, and for efficiency's sake, face-to-face testing may increasingly be conducted with test-taker pairs or groups for some purposes.

No matter how rating is conducted, studying the effects of rater background characteristics on raters' scoring will continue to be crucial to the establishment of an unbiased scoring procedure. When carrying out a rating procedure, if raters are influenced by factors that are not included in the scoring rubric that they are supposed to be applying, then those factors may be introducing unwanted, construct-irrelevant variance into the scoring process, thus clouding the interpretation that can be made of scores. Therefore, further research is needed to determine whether raters evaluating test takers' speech samples are influenced by extraneous factors (such as rater or test-taker background characteristics) that may impact their ratings of test-taker performance. Research in the area of rater characteristics and second or foreign-language testing has often relied on quantitative methods, but some studies have used qualitative or mixed methods to study rater cognition. For example, in the assessment of face-to-face oral proficiency interviews, Brown (2003) used retrospective verbal reports to investigate raters' reactions to test takers' performances and why they awarded the scores they did. Studies that do not use qualitative measures often lack an important component, and that is the ability to tap mental processes that may be suggestive of some particular characteristics not easily detected in a purely quantitative study. It is expected that more studies on rater bias will use mixed-methods approaches.

Rating Scales for Language Tests

CAROLYN E. TURNER

The interest in the quality of language ability in educational, professional, and research contexts has evolved over the last three decades. In language testing and assessment settings examinees are increasingly required to perform tasks which generate extended samples of speech and writing (i.e., extended responses/performances such as interacting in discussions, writing essays). This is in contrast to previous practice where examinees were only required to respond to isolated items often in a cryptic response (i.e., discrete point items such as multiple-choice formats). For what has become labeled as performance testing/assessment, criteria are needed to guide the judgments of examiners (whether they are teachers, government assessors, researchers, etc.). Rating scales are tools that are developed to provide these needed criteria and do so in the form of scale descriptors. Their content is pertinent to the nature of the language ability of interest in a particular context of communication. This entry will provide background on rating scales as they are used in the broader field of applied linguistics and more specifically in the field of language testing/assessment. The following will include: definition and purpose, types and uses, approaches to development, issues, and challenges.

Definition and Purpose

The term *rating scale* will be employed here, but it is important to note that *scoring rubric* and *proficiency scale* are also frequently used terms in the literature. Sometimes the various terms are used synonymously and sometimes not (e.g., see Goodrich, 1996, for a common educational representation of “rubrics”). Here the topic will be narrowed to performance test/assessment scales which will be referred to as *rating scales*. Davies et al. (1999) define a rating scale as

a scale for the description of language proficiency consisting of a series of constructed levels against which a language learner's performance is judged. Like a test, a proficiency (rating) scale provides an operational definition for a linguistic construct such as proficiency. (p. 153)

It is assumed that the purpose of this tool is to guide and facilitate the rating process and to contribute to the reliability of the judgments made by examiners. Judgments involve extended and sometimes complex language samples; therefore, rating scales help determine levels of degree in terms of language quality.

It is important to reiterate here that this entry will focus on performance test/assessment scales. Even though a discussion of measurement scales is beyond the scope of this entry, a brief statement will provide a framework for the discussion that follows. Going back to Stevens (1946) and simply stated we learn that

measurement, in the broadest sense, is defined as the assignment of numerals to objects or events according to rules. The fact that numerals can be assigned under different rules leads to different kinds of scales and different kinds of measurement. (p. 677)

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal1045

We know these scales to be labeled as nominal, ordinal, interval, and ratio. In general, language performances are best represented by an underlying ordinal scale in that judgments of performances result in rank ordering. As will be seen in the discussion below, scale descriptors (and in some cases additional classification rules) are constructed to describe and represent scale levels, but the fact remains there is an existing underlying measurement scale.

Types and Uses

Rating scales have been categorized in several ways in the literature according to their scoring format. They have been dealt with from numerous perspectives, and each normally addresses a particular audience and context (e.g., large-scale education, classroom progress, government selection, aviation communication, research). The two most common and conventional formats are *holistic* and *analytic*. (See Hamp-Lyons, 1991, and Weigle, 2002, for detailed descriptions in writing contexts; and Fulcher, 2003, for speaking contexts.) Both are normally generic scales that are applied to performances on different tasks, by different groups, and for different assessment purposes. Holistic scoring for a writing performance, for example, is a single rating given for overall ability. The rating scale description may make reference to attributes such as organization, vocabulary range, grammar, but the final single rating is based on the rater's global impression of the performance. On the other hand, for analytical scoring, raters provide several ratings, each on a separate scale representing a different attribute. The separate analytic ratings are sometimes combined to indicate overall ability. In general, both holistic and analytic scales are developed with the assumption of level hierarchy. That is, the skills described at a lower level must be acquired before the skills at the next level can be acquired. In addition, Barkaoui (2008) points out that some of the well-known large-scale, standardized tests use these scales for writing. IELTS uses an analytic rating scale, whereas TOEFL, MELAB, and CanTEST use holistic rating scales.

Also evident in the literature are alternative formats to holistic and analytic scales. These are *primary trait* and *multitrait* scales. The difference is mainly that the scales are task specific, that is, the context is taken into consideration. The scale criteria, therefore, indicate how well a performance satisfies the requirements of a specific task. For example, a writing task may direct students to "Read the following article entitled *The appropriate steps to take when preparing for a final exam*, summarize it, and criticize its content, relating your arguments to your personal experience" (Turner & Upshur, 1996). This might be scored on two traits (multitrait), expressing the main ideas of the article, and quality of argumentation. The two extreme score levels of a five-point scale are provided in Table 1.

Table 1 Example of multitrait scoring scale (adapted from Turner & Upshur, 1996, p. 58)

Score level	Trait	
	Main ideas	Argumentation
5	All main ideas of the article are included and expressed clearly. 	Two or more relevant arguments are well presented and effectively related to the writer's experience.
1	Main ideas of the article are difficult to identify.	Arguments, if present, are inadequately presented or may be irrelevant. Relation to writer's experience may be unclear.

There are several considerations when deciding what type of rating scale to use. There is no one best scale type. It will mainly depend on the purpose and context of the assessment being carried out. It is also important, however, to make an informed decision and be familiar with the literature that describes the advantages and disadvantages of each type of scale. Barkaoui (2008), for example, provides a comprehensive overview after using a multifaceted Rasch model and correlational analyses on data from trained raters employing both holistic and analytic scales to university-level essays. Holistic scoring demonstrated a higher level of inter-rater reliability, but analytic scoring showed several advantages (e.g., variability in writer characteristics clearly emerged in terms of the scale's criteria, conflicts in rater decisions were reduced thus increasing intra-rater reliability). Other literature also describes problems with both these types of scales in terms of reliability and validity. For example: criteria for such scales may lack empirical support, thus scale-point descriptions may include features that don't actually co-occur or the sequencing of features is not consistent with reality, second language acquisition research, or both; in classroom settings, such scales may be too broad spanning a range from "no competence" to "native-speaker competence" resulting in student performances only falling into the middle range, thus rendering the scale less useful (Turner & Upshur, 2002; Coombe, Folse, & Hubley, 2007; Fulcher, Davidson, & Kemp, 2011).

Approaches to Rating Scale Development

The above categorization of scale types can become blurred when looking at approaches to rating scale development. This is because the appearance of a final scale does not always reflect the manner in which it was constructed. Even though rating scales have been in use for decades in applied linguistics and language testing, specific procedures for their development were not prevalent in the literature until the 1990s. There were exceptions, however (e.g., the former Test of Written English, Stansfield, 1986), but such reports did not provide general guidelines for development. It was assumed from previous research that scales were developed from a conceptual framework based on a theory of language (Jamieson & Poonpon, in press). With the onset of a focus on communicative language ability and performance testing (as mentioned at the beginning of this entry), a call for scales using empirical development procedures became apparent in the literature (Chalhoub-Deville, 1995; Upshur & Turner, 1995; Fulcher, 1996; North, 2000). From this time forward, categorizations and descriptions of different approaches to rating scale development (including the more recent empirically based scales) began to appear more frequently in the literature. Turner and Upshur (2002) classify three approaches employed in constructing scales: (a) using theoretical views about the development of L2 (second language) ability as a starting point, (b) relying on learning objectives and their sequencing in an L2 curriculum, and (c) empirically eliciting scale developers' descriptions of differences in a sample of L2 test responses (p. 50). More recently, in Fulcher et al. (2011), two approaches are described: (a) measurement-driven methods and (b) performance databased methods. The researchers introduce a new type of rating instrument within the performance databased approach and label it performance decision trees (PDT). One of their goals is to try to accommodate the nature of interactions in communication settings. Also more recently, Jamieson and Poonpon (in press) discuss three approaches to scale development and scale refinement: (a) theoretically based, (b) functionally based, and (c) empirically based. In their description of the development of the TOEFL iBT speaking scale, they state three criteria for an effective rating scale "should be driven by a construct, be meaningful in given target language use situations, and be informed by analysis of actual spoken responses" (p. 5).

4 RATING SCALES FOR LANGUAGE TESTS

The more recent scale development approaches fall into the category of empirical methods which will be expanded here. They emerged as one response to criticisms of rating scales based solely on theory and have now been added to the repertoire of approaches as enumerated above. The resulting scale types fall into holistic, analytic, primary trait, and multitrait, but their construction is contingent on diverse empirical methods. The methods including their historical underpinnings are well explained in the literature. Some focus on validation and calibration of theoretically motivated performance descriptors and are measurement driven (e.g., North, 2000 in the development of the Common European Framework of Reference for Languages). Others focus on databased approaches with a close scrutiny of language performances as a starting point. Prominent language characteristics are identified and used to establish scale levels through statistical means (e.g., discriminant analyses, see Fulcher, 1996). A final performance databased procedure, and an example that will be described here, was developed within educational contexts and employs teachers as scale developers (see Turner & Upshur, 2002, for background on procedures based in personal construct psychology). Basically a group of raters (in this case, teachers) work with speech or writing samples. Repeatedly they individually rank the samples and then as a group come to a consensus on the specified number of levels. They identify and describe salient features that distinguish performances at adjacent levels. In this process scale descriptors emerge from holistically scaled samples. The resulting scale consists of an ordered set of binary questions related to the samples. They were initially labeled in Upshur and Turner (1995) as EBB scales: empirically derived, binary-choice, boundary-definition scales. Such scales are normally constructed for specific contexts and tasks. An example can be found in Figure 1. It is a scale developed by ESL secondary-level teachers in the French school system in Quebec, Canada. Its original purpose was for classroom use and the high-stakes ESL exit exam at the provincial level. As is the case

Figure 1 Example of an empirically derived rating (Turner, 2001, appendix A, p. 16)

with any category of scales, there are advantages and disadvantages to EBB scales. Even though they are efficient to use in educational settings and tend to have high inter-rater reliability, they are time-consuming to develop. Also due to their specificity of context, there is a lack of generalizability.

It is apparent from the literature that there are various views and practices concerning approaches to rating scale development as well as concerning the needed criteria for effective scales. Just as there is no one best scale type as mentioned above, there is also no one best scale development procedure. What is pertinent to know is that there are alternative development methods. Any selection should be driven by the assessment purpose and context which can greatly vary (e.g., a classroom setting versus a high-stakes test controlled setting). These in turn will drive the appropriate balance needed across rating scale qualities such as reliability, validity, and practicality (Bachman & Palmer, 1996; Neumann & Baker, 2008).

Issues and Challenges

This entry will conclude by returning to its beginning where the need for rating scales was discussed within the context of performance testing/assessment. Over the decades alternative types of rating scales and alternative approaches to rating scale development have emerged to meet this need. In combination with these efforts the inherent issues in the rating process have also been exposed. Rating scales are not just isolated tools that exist in a vacuum. Rating samples of language ability introduces a series of relationships that are being investigated in the research literature in that each one individually, in combination, or both may have effects on the final rating/score. Some of these are: examinee characteristics, task attributes, discourse qualities, rater characteristics, and scale types. Adding to the complexity is the growth and use of paired and group oral interaction assessments (McNamara & Roever, 2006; Ducasse & Brown, 2009; Fulcher et al., 2011). Figure 2 depicts a model of some potential relationships emerging in the rating process. The requirement to have raters (i.e., subjective judgments) has brought additional challenges such as inter- and intra-rater reliability and the contribution of rater training (Lumley, 2005). Through the development of many-facet Rasch measurement (Linacre, 2007) improved techniques for investigating rater effects is now possible. Therefore, we have made advances through the use of rating scales as tools to help measure language performance. With this use, however, ongoing research is needed to deal with the inherent issues that come with their use.

Figure 2 Potential relationships and effects in the rating process (Upshur & Turner, 1999, p. 106)

Rational Choice and Cost–Benefit Analyses in Language Planning

WILLIAM P. RIVERS

Rational choice and cost–benefit analyses of language policies and language planning efforts are a subset and consequence of the relatively recent expansion of intellectual inquiry in language planning to include microeconomic phenomena (one of which is rational choice) and macroeconomic considerations (i.e., cost–benefit analyses). The economics of language planning focus on the economic analysis of language as a commodity, first proposed by Marschak (1965), Thorbrun (1971), and Jernudd (1971). In narrow terms of economic theory, commodifying language problematizes the acquisition of language skills and the intergenerational transfer (or loss) of languages in terms amenable to economic analysis. The decision to use or acquire a language, whether at the level of the individual or the polity, can then be weighed against the resources needed and the expected gains from using or acquiring one or another language. We shall see that the idea of “commodifying” broadly includes a range of concepts in human and social capital, to include the prestige and value accorded to a particular language on bases other than purely remunerative terms. Finally, proper application of economic models for language policy analysis recognizes the interaction of polity-driven planning efforts and individual decisions in terms of the outcomes of language policy and planning efforts.

Two main types of analysis have been conducted on the economics of language: return on investment through examination of census data (in the US, UK, Canada/Quebec, Australia, and New Zealand) correlating earning to language use and rational choice analysis of language as a *common* or *consumer good*. See Savoie (1995) for a review of studies, and Chiswick and Miller (1995) for a typical example. The majority language of a given polity almost always provides the higher return in terms of wages. It is the latter group of studies which offers rational choice as a potential explanation for language shift: if the utility of learning or using one language exceeds that which accrues to another language, then the individual learner or speaker will choose the language with the greater utility (Grin, 1994). Language as a *common* or *national good* is a subject for national policy decisions on which language to designate as official, and what standardization, rules, and incentives to promulgate to support the use and acquisition of the language (Pool, 1991; Selten & Pool, 1991). A subset of this area of inquiry treats language as a form of human capital, enabling cost-savings in communications between different language groups. That is, language is analyzed as a common good enabling competitive advantages to one or another language group (Breton, 1978). The former has traditionally been designated *status planning*, and the latter encompasses both *corpus* and *acquisition* planning (Lambert, 1999). The utility of designating and promoting one language over others may be economic, such as the decision in 1998 by Nigeria to promote French as a means of bettering its trade position with its officially Francophone neighbors (French, 1998), developing a sense of national or regional identity (Schiffman, 1996; Williams, 1997), promoting nationalist political policies (Fortin, 1978; Solanchyk, 1985; Dingley, 1989; Kreindler, 1997) or consolidation of power in one party or language bloc within a polity (Breton, 1978; Solanchyk, 1985; Hough, 1996; Laitin, 1998). The costs are typically in the capital required to promote the acquisition of the language in question (Selten & Pool, 1991) or in the potential economic and cultural

isolation of a nation or region from its stronger monolingual neighbors, as in the case of Quebec before the Official Languages Act of 1981 (Fortin, 1978).

Language as a *consumer good*, subject to the purchasing decision of the individual speaker, has been the subject of a growing body of research. Breton and Mieszkowski (1977) first identified the potential for the analysis of language as a consumer good; Grin (1990) identifies utility functions and parameters for rational choice of language use, using Welsh as an example. Vaillancourt (1978, 1995) and Fortin (1978) extend this analysis to Quebec, commenting on the use of incentives for Anglophones to increase the prestige and economic return associated with acquiring and using French. Rivers (2002) used an analogous scheme to assess factors contributing to parental decisions on schooling in the Republic of Kazakhstan, with indications that maternal decisions to school Kazakh first language children in Russian-medium schools were driven in part by considerations of future career mobility and economic opportunity.

The ostensible goal of a cost–benefit analysis, whether post hoc as an evaluation of the implementation of a particular policy, or during the planning stages as an analysis of alternatives, is the straightforward determination of the expected gain from a policy per unit cost. As we shall see, conceptually this proves to be relatively intractable, in that while *costs* can be measured in terms of financial inputs required to implement a policy, *benefits* prove harder to quantify. This difficulty is particularly acute in macroeconomic cost–benefit analyses, where, as Brecht and Rivers (2005) note, “A cost–benefit analysis at the societal level involves the distinction between ‘private marginal value’ and the ‘social marginal value.’” The societal benefit can be expressed as the sum of private marginal values—in other words, the sum total of what each individual would gain from the implementation of a given policy—or as the value derived by the society or polity as a whole. This latter approach allows for consideration of national security, economic competitiveness, and social justice as legitimate benefits of a particular policy. As Kaplan and Baldauf note, this formulation of the benefit of a language policy proves particularly difficult to quantify: “Even if one could prove unequivocally—and one never can—that language treatment had a salutary effect it would be hard to calculate in any satisfactory sense the relative cost accrued for the benefits received” (Kaplan & Baldauf, 1997, p. 163). In their study of the cost-effectiveness of minority language revitalization policies in Western Europe, Grin and Vaillancourt explicitly refuse to evaluate the social marginal value of language policies: “The efficiency of a policy can only be judged in relation with society’s objectives, and the formulation of these objectives is a political process” (Grin & Vaillancourt, 1999, p. 3). What Brecht and Rivers (2005) propose is to accept the determination of policy objectives—that is, the putative benefits of a particular language policy—as a political process. For example, in the context of the foreign-language policies of the United States, they address the social marginal value of a linguistically competent workforce responsible for national security and the social marginal value of multilingual access to state social services. By rigorously identifying the needs for language capital, they provide a level of specificity that documents for political leaders the societal needs for language (Brecht & Rivers, 2005, p. 81). Among the specific subcategories they identify with respect to national needs for language capital are

- shortfalls in supply, where specific agencies or sectors have documented gaps in language coverage;
- shortfalls in capacity, where the underlying field resources (Brecht & Walton, 1994) are insufficient to enable the production of language capital—that is, the training of linguistically skilled individuals;
- asserted needs and demands, where policy makers and public officials indicate a requirement for language capital; and

- declared national policy, which states explicitly or implicitly the requirement for linguistic capital.

Brecht and Rivers then exemplify this structure with respect to social marginal value of language to US national security and social justice in the state of Maryland (Brecht & Rivers, 2005). Given specific benefits—that is, specific examples of social marginal value used as justifications and motivation for specific objectives of language policies—one can then assign costs to the attainment of these objectives.

We summarize by considering the applications of rational choice and cost–benefit analyses to language policy and planning. Among the immediate areas for further work for rational choice analysis is the consideration of individual choice for language use and intergenerational language transmission, in particular with respect to language revitalization and efforts aimed at reversing language shift (Fishman, 2001). As Rivers (2002) points out in his study of language shift in Kazakhstan, policy efforts that fail to consider individual choice may well fare poorly. Conversely, Grin (1990) shows that the prestige accruing to the use of Welsh had a demonstrable, salutary effect on the revitalization of Welsh. With respect to cost–benefit analyses, an immediate application we foresee is the practical one of developing clear, long-range language policies grounded in specific outcomes, these being tied to the costs and inputs required; a corollary of this level of rigor in planning is, at least in the US context, a transparent link between the policies often advocated by the language community, and the costs we ask government to bear. Making this link clearly allows a more persuasive argument to be made for the adoption of language policies, and places the policy objectives squarely in terms of the national interest and social justice.

Reading and Content Area Learning

DARIN STOCKDILL AND ELIZABETH BIRR MOJE

The demands of school-based reading change as young people move into upper grades (i.e., sixth grade and above). Specifically, with increasingly specialized courses in the sciences, mathematics, social studies, and English-language arts come increasingly complicated texts and associated reading demands (Shanahan and Shanahan, 2008; Carnegie Corporation of New York, 2010). One of the reasons that many students struggle with reading at this level is the changing language they encounter in the context of content study. Language in the texts of the secondary school content areas is “more foreign, abstract, technical, and complex than the language that students typically encounter in elementary reading” (Fang & Schleppegrell, 2008, p. 3). Ironically, as reading demands increase, the instructional scaffolding needed to help students meet these language demands typically decreases.
